PHYSICS ABSTRACTS

Physics Abstracts is one of a series of abstracts publications produced by INSPEC. Published twice monthly by the Institution of Electrical Engineers, it forms the world's major English-language abstracting service for the physics community.

SUBJECT SCOPE & COVERAGE

Physics Abstracts covers the whole field of physics. An impression of its scope can be gained from the classification scheme. The information contained in *Physics Abstracts* is derived from a wide range of sources including journals, reports, books, dissertations and conference papers published in all countries and languages of the world.

The number of items included is currently running at over 100,000 per year.

JOURNALS SCANNED

A list of the journals scanned for the INSPEC services is published with the twice-yearly author indexes to *Physics Abstracts*. Additions and amendments to this list are included in *Physics Abstracts* towards the end of the first issue for each month.

FORM OF ENTRY

All entries in *Physics Abstracts* follow the same basic pattern. The following example identifies the individual parts of a typical entry for an article from a journal.

Entry No. in PA ↓ **Title of paper** ↓

87093 PAC study of molecular rotational motions in dilute solutions.

Authors → A.Baudry, P.Boyer, J.D.Fabris, P.Vulliet (Lab. d'Interactions Hyperfines, CENG, Grenoble, France). ← **Author's affiliation**

Source of paper → *Hyperfine Interactions (Netherlands)*, vol.10, no.1-4, p.1057-62 (June 1981). (Proceedings of the Fifth International Conference on Hyperfine Interactions, Berlin, Germany, 21-25 July 1980).

The rotational tumbling of neutral chelates of hafnium dissolved in several organic solvents was studied via ^{181}Ta DPAC experiments. The results are compared with the predictions of a hydrodynamic model with partial slip boundary conditions. The influence of solute-solvent interactions and/or associations on the quadrupole relaxation is discussed. (16 refs.) } **Abstract**

Entries for other types of material differ mainly in the reference to the source, e.g., a report will refer to the report series and the number of the individual report. A conference paper on the other hand will normally refer to the title, place and date of the conference at which the paper was given.

SUBJECT ARRANGEMENT & SUBJECT GUIDE

The abstracts are arranged by subject in accordance with the scheme in the CLASSIFICATION and CONTENTS which appears opposite. The page number for the start of each subject section is given. An alphabetical index to the scheme—the SUBJECT GUIDE—follows the CLASSIFICATION and CONTENTS.

SUBJECT INDEXES

Detailed twice-yearly subject indexes to the individual entries are provided separately, covering the periods January-June and July-December. In these SUBJECT INDEXES each major concept occurring in each paper abstracted is indexed under headings drawn from the INSPEC Thesaurus.

AUTHOR INDEX

At the end of each issue, an alphabetical index of authors is provided showing the entry number of the items written by them. These indexes are cumulated every six months and, with the addition of the title of the individual papers, are published separately to cover the periods January-June and July-December of each year.

SUBSIDIARY INDEXES

Where appropriate, the following subsidiary indexes are included for the convenience of users:

Bibliography index of articles where a significant list of references or bibliography is contained.

Book index of books received and abstracted.

Corporate Author index where a corporate organisation rather than an individual is responsible for publication. This index includes all reports.

Conference index with reference to individual papers.

Subscription prices and ordering procedure are shown on the inside back cover.

PHYSICS ABSTRACTS is published twice monthly by the Institution of Electrical Engineers in association with the Institute of Electrical and Electronics Engineers Inc. Printed by Unwin Brothers Limited, The Gresham Press, Old Woking, Surrey. 2nd Class postage paid at Piscataway, N.J. 08854, USA. POSTMASTER: Send address changes to INSPEC/IEEE SERVICE CENTER, 445 Hoes Lane, Piscataway, N.J. 08854.

Physics Abstracts

CLASSIFICATION AND CONTENTS

The abstracts are arranged by subject in accordance with the following scheme. The page number for each section is given. The CLASSIFICATION AND CONTENTS is followed by an alphabetical guide to the scheme, the SUBJECT GUIDE.

The classification scheme is the result of cooperation between INSPEC, the American Institute of Physics, the European Physical Society and the Physics Working Group of the ICSU-AB.

1240M *Complex angular momentum plane; Regge poles and cuts (Reggeons)* 9384
1240P *Absorptive, optical, and eikonal models* —
1240Q *Potential models* 9384
1240R *Peripheral models (one or more particle exchange)* 9385
1240S *Multiperipheral and multi-Regge models* 9385
1240V *Vector-meson dominance* 9385
1270 Hadron mass formulas 9385
1290 Miscellaneous theoretical ideas and models —

1300 SPECIFIC REACTIONS AND PHENOMENOLOGY 9385
1310 Weak and electromagnetic interactions of leptons 9385
1315 Neutrino interactions 9385
1320 Leptonic and semileptonic decays of mesons 9385
1325 Hadronic decays of mesons 9385
1330 Decays of baryons 9386
1335 Decays of leptons 9386
1340 Electromagnetic processes and properties 9386
1340D *Electromagnetic mass differences* —
1340F *Electromagnetic form factors; electric and magnetic moments* 9386
1340H *Electromagnetic decays* 9386
1340K *Electromagnetic corrections to strong and weak interaction processes* 9386
1360 Photon and charged-lepton interactions with hadrons 9386
1360F *Elastic and Compton scattering* 9386
1360H *Total and inclusive cross sections* —
1360K *Meson production* 9387
1360M *Meson-resonance production* —
1360P *Baryon and baryon resonance production* 9387
1365 Hadron production by electron-positron collisions 9387
1375 Hadron-induced low- and intermediate-energy reactions and scattering, energy ≤ 10 GeV 9387
1375C *Nucleon-nucleon interactions, including antinucleon, deuteron, etc. (energy ≤ 10 GeV)* 9387
1375E *Hyperon-nucleon interactions (energy ≤ 10 GeV)* —
1375G *Pion-baryon interactions (energy ≤ 10 GeV)* 9388
1375J *Kaon-baryon interactions (energy ≤ 10 GeV)* 9388
1375L *Meson-meson interactions (energy ≤ 10 GeV)* 9388
1385 Hadron-induced high- and super-high-energy interactions, energy > 10 GeV 9388
1385D *Elastic scattering (energy > 10 GeV)* 9388
1385F *Inelastic scattering, two-particle final states (energy > 10 GeV)* —
1385H *Inelastic scattering, many-particle final states (energy>10GeV)* 9388
1385K *Inclusive reactions, including total cross sections, (energy > 10 GeV)* 9388
1385M *Cosmic ray interactions* —
1388 Polarisation in interactions and scattering 9389
1390 Other topics in specific reactions and phenomenology of elementary particles 9389

1400 PROPERTIES OF SPECIFIC PARTICLES AND RESONANCES 9389
1420 Baryons and baryon resonances 9389
1440 Mesons and meson resonances 9389
1460 Leptons 9389
1480 Other and hypothetical particles 9389

2000 **NUCLEAR PHYSICS** 9390

2100 NUCLEAR STRUCTURE 9390
2110 General and average properties of nuclei; properties of nuclear energy levels 9390
2110D *Binding energy and masses* 9390
2110F *Shape, charge, radius and form factors* 9390
2110H *Spin, parity, and isobaric spin* 9391
2110J *Spectroscopic factors* 9391
2110K *Electromagnetic moments* 9391
2110M *Level density and structure* 9391
2130 Nuclear forces 9391
2140 Few-nucleon systems 9391
2160 Nuclear-structure models and methods 9391
2160C *Shell model* 9391
2160E *Collective models* 9391
2160F *Models based on group theory* 9392
2160G *Cluster models* 9392
2160J *Hartree-Fock and random-phase approximations* 9392
2165 Nuclear matter 9392
2180 Hypernuclei 9392
2190 Other topics in nuclear structure —

2300 RADIOACTIVITY AND ELECTROMAGNETIC TRANSITIONS 9392
2320 Electromagnetic transitions 9392
2320C *Lifetimes and transition probabilities* 9392
2320N *Internal conversion and extranuclear effects* 9393
2340 beta decay; electron and muon capture 9393
2360 alpha decay 9393
2390 Other topics in nuclear decay and radioactivity 9394

2400 NUCLEAR REACTIONS AND SCATTERING: GENERAL 9394
2410 Nuclear reaction and scattering models and methods 9394
2410H *Optical and diffraction models* 9394
2430 Resonance reactions and scattering 9394
2450 Direct reactions 9394
2460 Statistical theory and fluctuations 9394
2470 Polarization in reactions and scattering 9394
2475 General properties of fission 9394
2490 Other topics in nuclear reactions and scattering, general —

2500 NUCLEAR REACTIONS AND SCATTERING: SPECIFIC REACTIONS 9394
2510 Nuclear reactions and scattering involving few-nucleon systems 9394
2520 Photonuclear reactions and photon scattering 9394
2530 Lepton-induced reactions and scattering 9394
2540 Nucleon-induced reactions and scattering 9394
2550 ^{2}H- and ^{3}H-induced reactions and scattering 9395
2560 ^{3}He- and ^{4}He-induced reactions and scattering 9395
2570 Heavy ion induced reactions and scattering 9395
2580 Meson- and hyperon-induced reactions and scattering 9396
2585 Fission reactions 9396
2588 Fusion reactions 9396
2590 Other topics in nuclear reactions and scattering: specific reactions —

2700 PROPERTIES OF SPECIFIC NUCLEI LISTED BY MASS RANGES 9396
2710 $A \leq 5$ 9396
2720 $6 \leq A \leq 19$ 9396
2730 $20 \leq A \leq 38$ 9397
2740 $39 \leq A \leq 58$ 9397
2750 $59 \leq A \leq 89$ 9397
2760 $90 \leq A \leq 149$ 9397
2770 $150 \leq A \leq 189$ 9397
2780 $190 \leq A \leq 219$ 9397
2790 $220 \leq A$ 9397

2800 NUCLEAR ENGINEERING AND NUCLEAR POWER STUDIES 9397
2820 Neutron physics 9397
2841 Fission reactor theory and design 9397
2842 Fission reactor materials 9398
2842H *Fuel preparation and reprocessing* 9400
2843 Fission reactor operation 9400
2844 Fission reactor protection systems, safety and accidents 9403
2850 Fission reactor types and applications 9404
2852 Fusion reactors 9405
2858 Integrated reactor systems —
2870 Nuclear explosions —
2880 Radiation technology, including shielding 9405
2890 Other topics in nuclear engineering and nuclear power studies 9406

2900 EXPERIMENTAL METHODS AND INSTRUMENTATION FOR ELEMENTARY-PARTICLE AND NUCLEAR PHYSICS 9406
2910 Preacceleration (injection) —
2915 Electrostatic and linear particle accelerators 9406
2920 Cyclic accelerators and storage facilities 9406
2925 Particle sources and targets, preparation and technology 9406
2930 Radiation spectrometers and spectroscopic techniques 9407
2940 Radiation detectors 9407
2960 Counting circuits and nuclear electronics 9408
2970 Radiation measurement, detection and counting 9408
2975 Polarization analysis —
2980 Nuclear information processing 9408
2990 Other topics in high-energy and nuclear experimental methods and instrumentation —

3000 **ATOMIC AND MOLECULAR PHYSICS** 9409

3100 THEORY OF ATOMS AND MOLECULES 9409
3110 General theory of structure, transitions and chemical binding 9409
3115 General mathematical and computational developments 9409
3120 Specific calculations and results 9409
3120D *Complete ab initio calculations (exact or nearly exact calculations on small species)* 9411
3120E *Ab initio LCAO and GO SCF calculations* 9411
3120G *Other accurate, or nearly ab initio calculations (DIM method, SAMO method, etc.)* 9411
3120L *Statistical model calculations (Thomas-Fermi and Thomas-Fermi-Dirac models)* —
3120N *Semi-empirical NDO calculations (CNDO, INDO, MINDO, PCILO methods, etc.)* 9411

page
3120P *Other semi-empirical calculations (Hückel, generalized Hückel, PPP methods, etc.)* 9412
3120R *Valence bond calculations (ab initio or not)* 9412
3120T *Electron correlation and CI calculations* 9412
3120W *Empirical methods (nonquantum methods for conformations, as Wiberg method, Westheimer method, etc.)* —
3130 Corrections to electronic structure 9413
3150 Excited states 9413
3170 Effects of molecular interactions on electronic structure 9414
3170D *Environmental and solvent effects* 9414
3170F *Potential-energy surfaces for collisions* 9414
3170H *Time-dependent phenomena: excitation and relaxation processes, and reaction rates* 9414
3170K *Molecular solids* 9414
3190 Other topics in the theory of atoms and molecules 9414

3200 ATOMIC SPECTRA AND INTERACTIONS WITH PHOTONS 9414
3220 Atomic spectra grouped by wavelength ranges 9414
3220B *Radiofrequency, microwave, and infrared spectra* 9414
3220J *Visible and ultraviolet spectra* 9414
3220R *X-ray spectra* 9415
3250 Fluorescence, phosphorescence 9415
3260 Zeeman and Stark effects 9415
3270 Spectral line shapes and intensities 9415
3280 Photon interactions with atoms 9416
3280B *Level crossing and optical pumping* 9416
3280D *Autoionization* 9416
3280F *Photoionization and photodetachment* 9416
3280H *Auger effect and inner-shell ionization* —
3280K *Multiphoton processes* 9416
3290 Other topics in atomic spectra and interactions with photons 9417

3300 MOLECULAR SPECTRA AND INTERACTIONS WITH PHOTONS 9417
3310 Calculation of molecular spectra 9417
3320 Molecular spectra grouped by wavelength ranges 9418
3320B *Radiofrequency and microwave spectra* 9418
3320E *Infrared spectra* 9418
3320F *Raman and Rayleigh spectra* 9419
3320K *Visible spectra* 9419
3320L *Ultraviolet spectra* 9419
3320N *Vacuum ultraviolet spectra* 9420
3320R *X-ray spectra* —
3325 Nuclear magnetic resonance and relaxation; nuclear quadrupole resonance (NQR) 9420
3330 Electron paramagnetic resonance and relaxation 9421
3335 Double resonances and other multiple resonances 9421
3335H *MODR and PMDR (microwave optical double resonance and phosphorescence microwave double resonance)* 9421
3340 Mössbauer spectra —
3345 Magneto-optical and electro-optical spectra; dichroism 9421
3345B *Zeeman and Stark effects* 9421
3345C *Magnetic circular dichroism* —
3350 Fluorescence, phosphorescence; radiationless transitions (intersystem crossing, internal conversion) 9421
3365 Photoelectron spectra 9422
3370 Intensities and shapes of molecular spectral lines and bands 9423
3380 Photon interactions with molecules 9423
3380B *Level crossing and optical pumping* 9423
3380E *Autoionization, photoionization, and photodetachment* 9423
3380G *Diffuse spectra; predissociation, photodissociation* 9424
3380K *Multiphoton processes* 9425
3390 Other topics in molecular spectra and interactions with photons —

3400 ATOMIC AND MOLECULAR COLLISION PROCESSES AND INTERACTIONS 9425
3410 General theories and models 9425
3420 Interatomic and intermolecular potentials and forces 9425
3440 Elastic scattering of atoms and molecules 9426
3450 Inelastic scattering of atoms and molecules 9426
3450E *Rotational and vibrational energy transfer* 9426
3450H *Electronic excitation and ionization (inc. beam-foil excitation and ionization)* 9427
3450L *Chemical reactions, energy disposal, and angular distribution, as studied by atomic and molecular beams* —
3470 Charge transfer 9427
3480 Electron scattering 9428
3480B *Elastic scattering of electrons by atoms and molecules* 9428
3480D *Atomic excitation and ionization by electron impact* 9428
3480G *Molecular excitation, ionization, and dissociation by electron impact* 9428
3490 Other topics in atomic and molecular collision processes and interactions 9429

page
3500 PROPERTIES OF ATOMS AND MOLECULES; INSTRUMENTS AND TECHNIQUES 9429
3510 Atoms 9429
3510B *Atomic masses, mass spectra, abundances, and isotopes* 9429
3510D *Electric and magnetic moments, polarizability* 9429
3510F *Relativistic corrections, fine- and hyperfine-structure constants* 9429
3510H *Ionization potentials, electron affinities* —
3510W *Weak Interactions* —
3520 Molecules 9429
3520B *General molecular conformation and symmetry; stereochemistry* 9429
3520D *Interatomic distances and angles* 9430
3520G *Bond strengths, dissociation energies, hydrogen bonding, etc* 9430
3520J *Barrier heights (internal rotation, inversion); rotational isomerism, conformational dynamics* 9431
3520M *Electric and magnetic moments (and derivatives), polarizability, and magnetic susceptibility* 9431
3520P *Rotation, vibration, and vibration-rotation constants* 9431
3520S *Hyperfine and fine-structure constants* 9431
3520V *Ionization potentials, electron affinities, molecular core binding energy* 9431
3520W *Weak interactions* —
3520X *Mass spectra* 9431
3520Y *Correlation times in molecular dynamics* —
3580 Atomic and molecular measurements and techniques 9431

3600 STUDIES OF SPECIAL ATOMS AND MOLECULES 9431
3610 Exotic atoms and molecules (containing mesons, muons, and other abnormal particles) 9431
3620 Macromolecules and polymer molecules 9432

7520 Diamagnetism and paramagnetism 9577
7520C *Nonmetals* 9578
7520E *Metals and alloys* 9578
7520H *Local moment in dilute alloys; Kondo effect* 9579
7525 Spin arrangements in magnetically ordered materials (neutron studies, etc) 9579
7530 Magnetically ordered materials, other intrinsic properties 9579
7530C *Saturation moments and magnetic susceptibility* 9579
7530D *Spin waves* 9579
7530E *Exchange and superexchange interactions* 9580
7530G *Anisotropy* 9580
7530H *Magnetic impurity interactions* 9580
7530K *Magnetic phase boundaries* 9580
7530S *Magnetocaloric effect* 9581
7540 Critical-point effects, specific heats, short-range order 9581
7540D *Ising and other classical spin models* 9582
7540F *Heisenberg and other quantized spin models* 9582
7550 Studies of specific magnetic materials 9582
7550B *Ferromagnetism of Fe and its alloys* 9582
7550C *Ferromagnetism of other metals* 9583
7550D *Ferromagnetism of nonmetals* 9583
7550E *Antiferromagnetics* 9583
7550G *Ferrimagnetics* 9583
7550K *Amorphous magnetic materials* 9583
7550M *Magnetic liquids* —
7560 Domain effects, magnetization curves, and hysteresis 9583
7560C *Domain walls and domain structure* 9583
7560E *Magnetization curves, hysteresis, Barkhausen and related effects* 9583
7560G *High coercivity materials* 9584
7560J *Fine-particle systems* 9584
7560L *Magnetic aftereffects* —
7560N *Magnetic annealing and temperature-hysteresis effects* —
7570 Magnetic films and plates 9584
7570K *Domain structure (magnetic bubbles)* 9585
7580 Magnetomechanical and magnetoelectric effects, magnetostriction 9585
7590 Other topics in magnetic properties and materials —

7600 MAGNETIC RESONANCES AND RELAXATION IN CONDENSED MATTER; MÖSSBAUER EFFECT 9585
7620 General theory of resonances and relaxation 9585
7630 Electron paramagnetic resonance and relaxation 9585
7630D *Ions and impurities: general* 9586
7630F *Iron group (3d) ions and impurities (Ti-Cu)* 9586
7630H *Platinum and palladium group (4d and 5d) ions and impurities (Zr-Ag and Hf-Au)* 9587
7630K *Rare-earth ions and impurities* 9587
7630L *Other ions and impurities* 9587
7630M *Colour centres and other defects* 9587
7630P *Conduction electrons* 9587
7630R *Free radicals* 9587
7640 Diamagnetic and cyclotron resonances 9588
7650 Ferromagnetic, antiferromagnetic, and ferrimagnetic resonances; spin wave resonance 9588
7660 Nuclear magnetic resonance and relaxation 9588
7660C *Chemical and Knight shifts* 9589
7660E *Relaxation effects* 9589
7660G *Quadrupole resonance* 9590
7660L *Spin echoes* —
7670 Magnetic double resonances and cross effects 9590
7670D *Electron-nuclear double resonance (ENDOR)* 9590
7670E *Dynamical nuclear polarization* 9591
7670F *Double nuclear magnetic resonance (DNMR)* —
7670H *Optical double magnetic resonance (ODMR)* 9591
7670K *Electron double resonance (ELDOR)* —
7680 Mössbauer effect; other gamma-ray spectroscopy 9591
7690 Other topics in magnetic resonances and relaxation —

7700 DIELECTRIC PROPERTIES AND MATERIALS 9592
7720 Permittivity 9592
7730 Polarization and depolarization effects 9592
7740 Dielectric loss and relaxation 9592
7750 Dielectric breakdown and space-charge effects 9593
7755 Dielectric thin films 9593
7760 Piezoelectricity and electrostriction 9593
7770 Pyroelectric and electrocaloric effects 9593
7780 Ferroelectricity and antiferroelectricity 9593
7780B *Transitions and Curie point* 9593
7780D *Domain structure and effects; hysteresis* 9594
7785 Electrical resonances —
7790 Other topics in dielectric properties and materials 9594

7800 OPTICAL PROPERTIES AND CONDENSED MATTER SPECTROSCOPY AND OTHER INTERACTIONS OF MATTER WITH PARTICLES AND RADIATION 9594
7820 Optical properties and materials 9594
7820B *General theory (for pure homogeneous materials)* 9594

page
7820D *Optical constants and parameters* 9594
7820E *Optical rotatory power* 9596
7820F *Birefringence* 9596
7820H *Piezo-, elasto- and acousto-optical effects* 9596
7820J *Electro-optical effects* 9596
7820L *Magneto-optical effects* 9597
7820N *Thermo-optical effects* 9597
7830 Infrared and Raman spectra and scattering 9598
7835 Brillouin and Rayleigh scattering 9602
7840 Visible and ultraviolet spectra 9602
7845 Stimulated emission 9603
7850 Impurity and defect absorption in solids 9603
7855 Photoluminescence 9603
7860 Other luminescence spectra and radiative recombination 9606
7860F *Electroluminescence* 9606
7860H *Cathodoluminescence, ionoluminescence* 9606
7860K *Thermoluminescence* 9606
7860M *Sonoluminescence, triboluminescence* 9607
7860P *Chemiluminescence* —
7865 Optical properties of thin films 9607
7870 Other interactions of matter with particles and radiation 9608
7870B *Positron annihilation* 9608
7870C *X-ray scattering* 9608
7870D *X-ray absorption and absorption edges* 9608
7870E *X-ray emission threshold and fluorescence* 9609
7870G *Microwave and radiofrequency interactions* 9609
7890 Other topics in optical properties of condensed matter and other interactions of matter with particles and radiation 9609

7900 ELECTRON AND ION EMISSION BY LIQUIDS AND SOLIDS; IMPACT PHENOMENA 9609
7920 Impact phenomena 9609
7920D *Laser-light impact phenomena* —
7920F *Electron impact: Auger emission* 9609
7920H *Electron impact: secondary emission* 9609
7920K *Other electron impact phenomena* 9610
7920N *Atom, molecule, and ion impact* 9610
7920R *Atomic and molecular beam interactions* 9611
7940 Thermionic emission 9611
7960 Photoemission and photoelectron spectra 9611
7970 Field emission and field ionization 9612
7975 Exoelectron emission 9612
7980 Resonance tunnelling —
7990 Other topics in emission and impact phenomena in condensed matter —

8000 CROSS-DISCIPLINARY PHYSICS AND RELATED AREAS OF SCIENCE AND TECHNOLOGY 9612

8100 MATERIALS SCIENCE 9612
8110 Methods of crystal growth and purification 9612
8110B *Growth from vapour* 9612
8110D *Growth from solutions* 9612
8110F *Growth from melts* 9613
8110H *Zone melting and zone refining* 9613
8110J *Growth from solid phases* —
8115 Methods of thin film deposition 9613
8115C *Deposition by cathodic sputtering* 9613
8115G *Vacuum deposition* 9614
8115H *Chemical vapour deposition* 9614
8115J *Ion plating and other vapour deposition* 9615
8115L *Deposition from liquid phases (melts and solutions)* 9615
8120 Other methods of preparation of materials 9615
8120C *Vacuum methods* —
8120E *Powder techniques, compaction and sintering* 9615
8120G *Specific metals and alloys (compacts, pseudoalloys)* 9615
8120J *Dispersion-fibre-, and platelet-reinforced metal-based composites* 9616
8120L *Ceramics and refractories* 9616
8120N *Cermets, ceramic and refractory composites* 9617
8120P *Glasses* 9617
8120Q *Glass-based composites, vitroceramics* —
8120S *Polymers* 9617
8120T *Reinforced polymers and polymer-based composites* 9618
8130 Phase diagrams and microstructures developed by solidification and solid-solid phase transformations 9618
8130B *Phase diagrams of metals and alloys* 9618
8130D *Phase diagrams of other materials* 9619
8130F *Solidification* 9619
8130H *Constant-composition solid-solid phase transformations: polymorphic, massive, and order-disorder* 9620
8130K *Martensitic transformations* 9620
8130M *Precipitation* 9620
8140 Treatment of materials and its effects on microstructures and properties 9621
8140C *Solid solution hardening, precipitation hardening, dispersion hardening* 9621

page
8140E *Cold working, work hardening; annealing, recovery and recrystallisation; textures* 9621
8140G *Other heat and thermomechanical treatments* 9622
8140J *Elasticity and anelasticity* 9623
8140L *Deformation, plasticity and creep* 9623
8140N *Fatigue, embrittlement, and fracture* 9625
8140P *Friction, lubrication, and wear* 9629
8140R *Electrical and magnetic properties (related to treatment conditions)* 9630
8140T *Optical properties (related to treatment conditions)* 9630
8160 Corrosion, oxidation and surface treatments 9630
8160B *Metals and alloys* 9632
8170 Materials testing 9635
8190 Other topics in materials science 9640

8200 PHYSICAL CHEMISTRY 9640
8220 Chemical kinetics 9640
8220K *Potential energy surfaces for chemical reactions* 9640
8220M *Nonequilibrium kinetics* 9640
8220R *Energy distribution and transfer, relaxation* 9640
8230 Specific chemical reactions; reaction mechanisms 9640
8235 Polymer reactions and polymerization 9642
8240 Chemical kinetics and reactions: special regimes 9643
8240D *Atomic and molecular beam reactions* —
8240T *Chemiluminescence and chemical laser kinetics* 9643
8245 Electrochemistry and electrophoresis 9643
8250 Photochemistry and radiation chemistry 9644
8250E *Photodissociation, photoionization as studied by luminescence and radiationless transitions* 9645
8255 Radiochemistry 9645
8260 Chemical thermodynamics 9645
8265 Surface processes 9646
8270 Disperse systems 9646
8280 Chemical analysis and related physical methods of analysis 9647

SUBSIDIARY INDEXES

SUBJECT GUIDE

The SUBJECT GUIDE is an alphabetical index to subjects covered in the classification scheme, by which the abstracts are arranged. The numbers given are classification codes. The CLASSIFICATION AND CONTENTS, which precede the Guide, gives the page number for each section.

Classification
A mesons 1440
Ab initio calculations 3120
Aberrations 4180, 4230, 4278
Abrasion 4630P, 6220P, 8140P
Absorptive models 1240P
Acceleration measurement 0630G
Accumulation layers 7320, 7340Q
Acoustic devices 4385
Acoustic holography 4363
Acoustic noise 4350, 4360, 4388, 8670J
Acoustic nuclear magnetic resonance 7660
Acoustic paramagnetic resonance 7630
Acoustic properties of gases 5140
Acoustic properties of liquids 6260
Acoustic properties of solids 6265
Acoustic signal processing 4360
Acoustic wave propagation 4320, 4325, 5140, 6260, 6265
Acoustics 43
Acousto-optical effects 5140, 5170, 7820H
Acoustoelectric effects 4388, 5140, 5150, 7250
Adaptive optics 42
Adherence 4630P
Adhesion 4630P, 6825, 8190
Adsorption 6845, 8265
Aerodynamics 4740
Aeroelasticity 4630C, 4630M
Aeronomy 94
Aerosols 4755K, 8270, 92
Aerospace 9480, 9555
Aerospace biophysics 8765
Ageing 8140G
Airglow 9410Q
Algebra 0210
Alpha decay 2360
Alpha particle-nucleus reactions 2560
Alpha particle-nucleus scattering 2560
Alpha particle spectroscopy 2930
Alpha particles 2140, 2710
Amorphous semiconductors 6140, 7125M, 7220, 7280N
Amorphous state 6140, 81
Anderson model 7110, 7125M, 7155
Anelasticity 4630J, 6240, 8140J
Anemometers 4780, 9385
Angular measurement 0630C
Annealing 8140E, 8140G
Anodisation 8160, 8245
Antiferrimagnetism 7530
Antiferroelectric materials 7780
Antiferromagnetic properties of substances 75, 7550E
Antiferromagnetic resonance 7650
Antiphase boundaries 81
Antiphase domains 81
Antireflection coatings 4270, 4278H, 4280
Appearance potential spectroscopy 0785, 7870E
APW calculations 7110, 7125C
Architectural acoustics 4355
Artificial limbs 8770J
Artificial organs 8770J
Association 6120, 6125, 8230
Asteroids 9630H
Astroarchaeology 9590
Astrometry 95, 9555
Astronomical instruments 95
Astronomy and astrophysics 95, 96, 97, 98
Atlases 9585
Atmospheric acoustics 4328
Atmospheric optics 9265
Atmospherics 9260, 94
Atom beam reactions 8240D
Atom-surface impact 34, 7920N, 7920R
Atomic beams 3440, 3450, 3580, 8240D
Atomic clusters 3640
Atomic collisions 34
Atomic electric moments 3510D

01.30C Conference proceedings

116910 Theoretical Symposium on Intense Medium Energy Sources of Strangeness.
AIP Conf. Proc. (USA), no.102 (1983).
Conference held at: Santa Cruz, CA, USA. Date 18-21 March 1983. Sponsors: Santa Cruz Inst. Particle Phys.; Nat. Sci. Found. et al. The following topics were dealt with: kaon factories; CP violation; weak interactions; rare kaon decays; strange particles; supersymmetric models; unified field theory; gauge field theory; left-right mixing; Higgs bosons. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

116911 International Workshop on Strain Patterns in Rocks.
J. Struct. Geol. (GB), vol.5, no.3-4 (1983).
Conference held at: Rennes, France. Date 13-14 May 1982. The following topics were dealt with: strain analysis, gneiss, Fry's method, porphyroid, Massif Central, France, geology, orthographic analysis, deformation, Mohr circle construction, volume changes, chemical analysis, discontinuity, cleavage, ductile zones, shear zones, thrust zones, quartzite mylonite, Australia, Aar granite, plutons, Archaean greenstone, Ontario, Canada, Pardailhan Nappe, folding and ice caps.

116912 5th International Congress of Biorheology.
Biorheology (GB), vol.20, no.4 (1983).
Conference held at: Baden-Baden, Germany. Date 20-24 Aug. 1983. The following topics were dealt with: haemorheological disorders in cardiovascular diseases; permeability and the blood vessel wall; theoretical considerations in biorheology; normal and pathological mucus; role of haemorheology in blood transfusion; theoretical aspects of tissue deformability; RBC-mechanics and in vivo microcirculatory flow; some biorheological aspects of joint diseases; tumour microcirculation; red cells; microhaemodynamics; biological fluids. Abstracts of individual papers can be found under the relevant classification codes in future issues.

116913 SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369 (1983). [received: Sept. 1983]
Conference held at: Edinburgh, Scotland. Date 7-10 Sept. 1982. Sponsors: SPIE. The following topics were dealt with: vision; medical and biological applications; infrared; interferometry; measurement; remote measurement; nonlinear optics; astronomy; focus on industry; lasers and laser systems; spectroscopy; fibres and fibre sensors; image processing; holography and gratings; scattering and general theory. 114 papers were presented, all of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

116914 Advanced Remote Sensing.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.363 (1983).
Conference held at: San Diego, CA, USA. Date 26-27 Aug. 1982. The following topics were dealt with: remote sensing, vegetation stress, satellite ocean colour measurement, fisheries, weather forcasting, USA, TV compatible thermal imager, signal processing, gyroscope, general theory of relativity, Spacelab 2 IR telescope, cooled grating IR spectrometer, Earth feature classification, CCD Digicon-detector system, mosaic focal plane, detection probability, Information Adaptive System, real time onboard image processing, bubble domain technology, spacecraft onboard memories and detector array signal acquisition.

116915 Optical Sensing Techniques, Benefits, Costs.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.376 (1983).
Conference held at: Teddington, Middx., England. Date 7-8 Dec. 1982. Sponsors: Inst. Measurement & Control; IEE. The following topics were dealt with: optical sensing and engineering metrology; surface form enhancement by heterodyne moire contouring; role for automatic fringe analysis in optical metrology; shutter modulator sensor with fibre optic links; optical fibre sensors for displacement measurement; automated visual control system for gob feeders; rapid video data capture and processing system for computer image measurement and analysis; optical sensing in product inspection; high speed photography and videography; advanced thermal imaging systems and their commercial applications; real time depth measurement in a stereoscopic television display; automatic inspection of fine lines and automatic visual inspection applied to silicon chip packaging. 17 papers were presented, of which 16 are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

116916 First World Congress on Desalination and Water Re-Use.
Desalination (Netherlands), vol.44 (May 1983).
Conference held at: Florence, Italy. Date 23-27 May 1983. The following topics were dealt with: energetic and economics of desalination processes; materials and corrosion; solar and freezing processes; membrane processes; electrodialysis and water use and water recovery. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

116917 Proceedings of the 1983 US Workshop on the Physics and Chemistry of Mercury Cadmium Telluride.
J. Vac. Sci. & Technol. A (USA), vol.1, no.3 (1983).
Conference held at: Dallas, TX, USA. Date 8-10 Feb. 1983. Sponsors: Army Res. Office; American Vacuum Soc. The following topics were dealt with: physics and chemistry of material growth; impurities and defect structures of $Hg_{1-x}Cd_xTe$ semiconductors; techniques for characterisation of $Hg_{1-x}Cd_xTe$ materials and electronic properties; physics of electronic and optical properties and semiconductor surfaces and interfaces. 38 papers were presented, of which 38 are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

116918 Second Annual Conference of the American Association for Aerosol Research.
Aerosol Sci. & Technol. (USA), vol.2, no.2 (1983).
Conference held at: Washington, DC, USA. Date 18-21 April 1983. Sponsors: American Assoc. Aerosol Res. The following topics were dealt with: aerosol capture; aerosol growth; aerosol dynamics; particle transport; aerosol precursors; atmospheric sulphate aerosol formation and transport, and numerous other aspects of aerosol research. 158 papers were presented, of which 5 are published in full in the present proceedings, and 152 as abstracts only. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

116919 Proceedings of the Meeting of the Astronomical Science Group of Ireland.
Irish Astron. J., vol.15, no.4 (Sept. 1982). [received: Sept. 1983]
Conference held at: Belfast, Northern Ireland. Date 15 Dec. 1981. The following topics were dealt with: galactic halo, peculiar early type stars, abundance analyses, spotted stars observations, black hole radiation and the night sky green light.

116920 10th Annual Conference of the Association for Aerosol Research (Gesellschaft fur Aerosolforschung).
J. Aerosol Sci. (GB), vol.14, no.3 (1983).
Conference held at: Bologna, Italy. Date 14-17 Sept. 1982. Sponsors: Univ. Bologna; Consiglio Nazionale delle Ricerche. The following topics were dealt with: airway deposition and clearance; diagnostic and therapeutic aerosols; aerosols in meteorology filtration of aerosols; generation of aerosols and air pollution; ultrafine aerosols and diffusion; chemistry of particulate air pollution; intercomparison of instrumentation; nonspherical particles; optics of aerosols and instrumentation; condensation and evaporation and nuclear and radioactive aerosols. 83 papers are published in the present proceedings.

116921 Meeting of the French and Belgian Societies for Electron Microscopy.
J. Microsc. & Spectrosc. Electron. (France), vol.8, no.3 (1983).
Conference held at: Liege, Belgium. Date 16-19 May 1983. The following topics were dealt with: grain boundary structure in hexagonal crystals; grain boundary structure observed by high resolution electron microscopy; electron diffraction of symmetrical tilt boundaries in germanium; characterisation of grain boundaries in silicon by TEM and EBIC; grain boundary structure and properties in engineering materials; intergranular segregation and precipitation; AES and STEM-EDS X-ray microanalysis studies of intergranular segregation and the identification of numerical simulation of contrasts visible in crystalline interfaces. 9 papers were presented, all of which are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

116922 Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors).
J. Phys. Colloq. (France), vol.44, no.C-3 (June 1983).
Conference held at: Les Arcs, France. Date 11-15 Dec. 1982. The following topics were dealt with: the chemistry, characterization and transport properties of polyacetylene; the theory, magnetic and optical properties of polyacetylene; the electrochemistry, intercalation and applications of polyacetylene; and other polymers (polypyrrole, polyacrylonitrile, polydiacetylene, polyparaphenylene, etc.). 151 papers are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

116923 Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals).
J. Phys. Colloq. (France), vol.44, no.C-3 (June 1983).
Conference held at: Les Arcs, France. Date 14-18 Dec. 1982. The following topics were dealt with: organic superconductors; physical, electronic and structural properties of $(TMTSF)_2$ and $(TMTTF)_2$ salts; electronic and structural properties of one-dimensional conductors; theory and applications of one-dimensional conductors; new materials; physical properties and theory of trichalcogenide compounds. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

116924 European Geophysical Society Meeting on the Structure of the Upper and Middle Atmosphere.
Planet. & Space Sci. (GB), vol.31, no.9 (1983).
Conference held at: Leeds, England. Date 23-27 Aug. 1982. The following topics were dealt with: semi-empirical thermospheric models; determination of atmospheric composition and temperature from the UV airglow; solar indices and solar UV irradiances; photodissociation effects of solar UV radiations; 27-day variations in solar UV irradiance; chemical budgets of the stratosphere; the ozone budget in the stratosphere; ozone variability; the influence of biology on the composition of the atmosphere; and peroxyacetyl nitrate in the troposphere and lower stratosphere. 15 papers were presented, of which 10 are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

116925 Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares.
Sol. Phys. (Netherlands), vol.86, no.1-2 (1983).
Conference held at: Tokyo, Japan. Date 5-8 Oct. 1982. Sponsors: Japan Soc. Promotion of Sci.; U.S. Nat. Sci. Found. Artificial satellites, instruments, flares, energy transport, chromosphere heating and evaporating, emission processes and source structures, high energy photons, nuclear processes and particle acceleration.

116926 Scanning Electron Microscopy 1983 Conference.
Scanning Electron Microsc. (USA), pt.1 (1983).
Conference held at: Dearborn, MI, USA. Date 17-22 April 1983. Sponsors: Scanning Electron Microscopy Inc. The following topics were dealt with: surface analysis; analytical electron microscopy; other analytical techniques; material characterization; electron beam testing in semiconductors; electronics of semiconductors; particle characterization; geological applications; forensic sciences; backscattered electron imaging in biology; biological specimen preparation; neurobiology; clinical applications; biological microanalysis; sensory organs; blood and blood-vascular systems; microbiology; parasitology; cell culture; cancer; stones and crystals; bone and biomineralization; muscle; kidney; skin biology; respiratory system; cell surface labelling; developmental biology and plant biology. 96 papers were presented. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

116927 First International Conference on Advances in Ferrography.
Wear (Switzerland), vol.90, no.1 (15 Sept. 1983).
Conference held at: Swansea, Wales. Date 22-24 Sept. 1982. The following topics were dealt with: continuous wear measurement; online ferrography; wear particles; arthritic disease application; particle size distribution. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

116928 Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium.
Vienna, Austria: IAEA (1983), 729 pp.
Conference held at: Munich, Germany. Date 11-15 Oct. 1982. The following topics were dealt with: experience with control and instrumentation of nuclear power plants; advanced systems for operator support; protection systems; control systems; measurement techniques; reliability, qualification and maintainability. 49 papers were presented, of which all are published in full in the present proceedings. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

116929 Laser 83 Opto-Elektronik. 6th International Congress and International Trade Fair (papers in summary form only received).
Munich, Germany: Munchener Messe-und Ausstellungsgesellschaft (1983), 260 pp.
Conference held at: Munchen, Germany. Date 27 June-1 July 1983. The following topics were dealt with: optoelectronic components and sensors; optoelectronic signal transmission; lasers in material processing; CO_2 laser systems and diagnostics; lasers and optoelectronics in medicine.

116930 AGARD Conference Proceedings No.332. Propagation Aspects of Frequency Sharing, Interference and System Diversity. 31st Symposium of the Electromagnetic Wave Propagation Panel.
Neuilly-sur-Seine, France: AGARD (1983), ix+428 pp.
Conference held at: Issy-les-Moulineaux, France. Date 18-22 Oct. 1982. Discusses frequency spectrum allocation and interference problems for both terrestrial and satellite radio links. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

116931 Proceedings of the 5th International Conference on Deformation, Yield and Fracture of Polymers.
London, England: Plastics & Rubber Inst. (1982), xv+306 pp.
Conference held at: Cambridge, England. Date 29 March-1 April 1982. The following topics were dealt with: deformation and yield; fracture; crazing; fatigue; fibre composite materials; time dependent phenomena; effects of processing. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

116932 Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute.
Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff (1981), xiv+913 pp. [90 286 2161 X]
Conference held at: Norwich, England. Date 23 July-4 Aug. 1979. Sponsors: NATO. Three interrelated subjects are discussed: scattering methods for low and intermediate frequencies; high frequency scattering methods and related application areas; and mechanisms of biological interaction and microwave bioeffects. Abstracts of individual papers can be found under the relevant classification codes in this or future issues.

Proceedings of the 26th Conference on Great Lakes Research (papers in summary form only received) .... See Entry 121378

01.30K Handbooks, dictionaries, tables and data compilation

116933 Revision of the evaluated UKCNDC Activation-Product Decay-Data Library. A.L.Nichols (Technol. Div., AEE Winfrith, Dorchester, England).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1249-58 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
The Data Library Sub-committee of the UK Chemical Nuclear Data Committee (UKCNDC) is responsible for the construction and maintenance of the following radioactive-decay-data libraries: (1) Fission-Product Decay Data (UKFPDD-2), (2) Activation-Product Decay Data (UKPADD-1), (3) Heavy-Element Decay Data (UKHEDD-1). Efforts have begun to expand the Activation-Product Decay-Data Library considerably in order to satisfy decay-data requirements for possible fusion-as well as fission-reactor systems. This new library (UKPADD-2) will contain decay data for 410 nuclides. (17 refs.)

116934 Sensitivity factors for XPS analysis of surface atoms. C.D.Wagner (Surfex Co., Oakland, CA, USA).
J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.32, no.2, p.99-102 (Sept. 1983). (11 refs.)

116935 Computer-calculated potential pH diagrams to 300°C. Vol.II: Handbook of diagrams. C.M.Chen, K.Aral, G.J.Theus.
Report EPRI-NP-3137, Electr. Power Res. Inst., Palo Alto, CA, USA (June 1983), 122 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
The authors present a diagram handbook showing the many potential pH diagrams for specific elements in water at temperatures ranging from 25 to 300°C. These diagrams can serve as guides to help devise mechanisms that describe the corrosion processes.

116936 24th 1982 meteorological yearbook of Ispra. G.Bollini, A.Galva, C.Gandino, E.Porrati.
Report EUR 8538 IT, Comm. European Communities, Luxembourg (1983), v+88 pp. In Italian.
After a short description of the methods of measuring and analysing atmospheric phenomena, many tables and graphics for the meteorological year 1982 are reported with English titles.

01.30T Bibliographies

116937 Reports, standards, and safety guides. E.G.Silver, D.S.Queener. *Nucl. Saf. (USA)*, vol.24, no.4, p.568-74 (July-Aug. 1983).
The authors present five lists of various documents relevant to nuclear safety. These lists are foreign reports (received under exchange agreements), reactor operations-related reports of US origin, other books and reports, regulatory guides, and nuclear standards. Each list contains the documents in its category which were published (or became available) during March-April 1983. The availability and cost of the documents are given in most instances. (no refs.)

116938 An electron energy-loss bibliography. R.F.Egerton, M.Egerton (Phys. Dept., Univ. of Alberta, Edmonton, Canada).
Scanning Electron Microsc. (USA), pt.1, p.119-42 (1983). (Scanning Electron Microscopy 1983 Conference, Dearborn, MI, USA, 17-22 April 1983).
This bibliography lists recent publications related to electron energy-loss spectroscopy carried out in an electron microscope, particularly those relevant to inner-shell spectroscopy and elemental analysis. It contains approximately 700 entries, listed alphabetically within 24 sections, each section dealing with a different aspect of experimental technique, practical application or theory. The emphasis is on measurements carried out using a transmission electron microscope, and especially on the use of inner-shell spectroscopy for elemental analysis, but references are also given to valence-loss studies and to measurements and calculations of inelastic scattering cross sections. (708 refs.)

01.40 EDUCATION

116939 Educational image processing: an overview. J.R.Jensen (Dept. of Geography, Univ. of South Carolina, Columbia, SC, USA).
Photogramm. Eng. & Remote Sensing (USA), vol.49, no.8, p.1151-7 (Aug. 1983).
Digital image processing is often an integral part of a student's education in remote sensing. Such instruction is normally accomplished by (1) providing digital image processing laboratory assignments within the context of introductory remote sensing courses and/or (2) teaching separate classes or seminars specifically oriented toward digital image processing of remotely sensed data. The general course content of such approaches is briefly reviewed. In addition, image processing system configurations to support these scenarios are identified and discussed. (56 refs.)

01.50 EDUCATIONAL AIDS

116940 Demonstration of holograms. I.Leifer (Dept. of Phys., Napier Coll., Edinburgh, Scotland).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.474-7 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Demonstration of holograms made by students from the Physics Department of Napier College, Edinburgh. One of the holograms shown illustrates the relationship between the orthoscopic and pseudoscopic images when both images are virtual. (5 refs.)

116941 Instructional use of a mainframe interactive image analysis system. T.H.L.Williams, C.Gunn, J.Siebert (Dept. of Geography-Meteorology, Univ. of Kansas, Lawrence, KS, USA).
Photogramm. Eng. & Remote Sensing (USA), vol.49, no.8, p.1159-65 (Aug. 1983).
The increasing demand for training in digital image analysis techniques calls for the widespread development of suitable training courses in academic institutions. Implementation of image analysis program packages on college and university mainframe computers can aid this development in a cost-effective manner. The Department of Geography-Meteorology and the Kansas Applied Remote Sensing (KARS) Program have developed an instructional interactive image analysis program package that runs on the University of Kansas central computer. A brief description of the program package is given, followed by a discussion of the advantages and limitations of image analysis instruction in a time-sharing mainframe environment. (3 refs.)

116942 Digital image processing using the Apple II microcomputer. R.W.Kiefer (Dept. of Civil & Environmental Engng., Univ. of Wisconsin, Madison, WI, USA), F.J.Gunther.
Photogramm. Eng. & Remote Sensing (USA), vol.49, no.8, p.1167-74 (Aug. 1983).
The inexpensive Apple II microcomputer can be used for digital image processing in operational and educational environments. The Apple II is portable enough to be taken directly into the classroom for lecture demonstrations and laboratory exercises. It is easily taken into the field for on-site data analysis or local presentations. Processing results can be displayed on a color monitor/TV screen in either low-resolution or high-resolution graphics, or can be printed on a line printer. At least five digital image processing systems (software packages) are in use in the United States: Apple II Digital Image Processing System (A/DIPS), Apple Image Processing Educator (AIPE), Oklahoma Landsat Training Program System, Apple Personal Image Processing System (APPLEPIPS), and Mini-LARSYS. (10 refs.)

116943 A hybrid image classification instructional package. J.R.Eyton (Dept. of Geography, Pennsylvania State Univ., University Park, PA, USA).
Photogramm. Eng. & Remote Sensing (USA), vol.49, no.8, p.1175-81 (Aug. 1983).
An introductory undergraduate course in digital remote sensing has been successfully conducted using a combination of Landsat image processing programs and mainframe statistical and mapping library routines. This hybrid approach allows for considerable flexibility and makes maximum use of the software and hardware commonly supported by an academic computer center. Students work through the entire classification process starting with Landsat image subsets extracted from a Computer Compatible Tape and finishing with a colored hard copy map of the final classification. Emphasis is placed on students understanding the various classification procedures at the expense of image processing efficiency. A number of different computer graphic algorithms are used to facilitate the students' comprehension of both the spatial and statistical content of the image data. (6 refs.)

01.65 HISTORY OF SCIENCE

116944 The constancy of the laws of physics in the light of prehistoric nuclear reactors. J.M.Irvine (Dept. of Theoretical Phys., Manchester Univ., Manchester, England).
Contemp. Phys. (GB), vol.24, no.5, p.427-37 (Sept.-Oct. 1983).
The constancy of the laws of physics is an essential ingredient in the development of science and is implicitly assumed in the application of physics to the interpretation of astronomy and geology. The author reviews the present status of the tests of the temporal invariance of the basic interactions of physics. It reaches the conclusion that experimental tests are consistent with no time variation of the gravitational constant, but points to a fundamental difficulty in interpreting such results. The most precise tests of the temporal variation of the electromagnetic interaction together with the strong and weak nuclear forces are supplied by an analysis of neutron capture cross-sections in the spontaneous fossil nuclear reactor established in Gabon two thousand million years ago. (6 refs.)

116945 Born, the innovator. L.R.Baker (Sira Ltd., South Hill, Chislehurst, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.2-7 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
The essence of innovation, which is the successful combination of need and technical feasibility, was well illustrated by Born in his analogue computer for determining Fourier transforms of a number of different functions which occur in acoustics, optics and X-ray crystal analysis. After a brief description of the first photo-electric Fourier transformer, which involved rotating a sine grating behind a slit to select a range of spatial frequencies, subsequent developments of Born's basic idea are discussed and, in particular, its use in equipment for measurement of the optical transfer function (OTF). The widespread use of this equipment has led to several international exchanges of information on standards relating to image quality and, even after 20 years of intense technical development throughout the world, the performance of OTF systems based on Born's idea has not so far been surpassed. (8 refs.)

116946 Hydrophobic interactions—a historical perspective. F.Franks (Dept. of Botany, Univ. of Cambridge, Cambridge, England).
Faraday Symp. Chem. Soc. (GB), no.17, p.7-10 (1982). [received: Sept. 1983] (Symposium on the Hydrophobic Interaction, Reading, Berks., England, 15-16 Dec. 1982).
Hydrophobic effects play a dominant role in a variety of technological processes, in the stabilization of supermolecular biological structures and in the mechanisms associated with biosynthesis, metabolism and physiological function. The author attempts to trace the development of the understanding of hydrophobic effects from the thirties onwards. (29 refs.)

116947 Rutherford and beta decay. W.E.Burcham (Dept. of Phys., Univ. of Birmingham, Birmingham, England).
Proc. R. Soc. London Ser. A (GB), vol.389, no.1797, p.215-39 (8 Oct. 1983).
Rutherford's concern for the properties of the α-particle did not divert him from the more difficult task of characterizing beta decay. The lecture traces the experimental steps by which some of the main features of this process were established in his laboratories at Montreal, Manchester and Cambridge. It concludes with a brief account of some beta-decay experiments that throw light on the mass of the Z^0 boson of the weak interaction. (64 refs.)

02.10 ALGEBRA, SET THEORY, AND GRAPH THEORY

116948 Branching rules for irreducible representations of E_8 into D_8. G.Belanger (Dept. of Phys., Johns Hopkins Univ., Baltimore, MD, USA).
J. Phys. A (GB), vol.16, no.15, p.3421-33 (21 Oct. 1983).
The branching rules for irreducible representations of E_8 into D_8 are calculated using the knowledge of the Kronecker products for those two algebras. Tables of Kronecker products for both E_8 and D_8 algebras are also included. (11 refs.)

116949 Geometric convergence of some two-point Pade approximations. G.Nemeth (Central Res. Inst. for Phys., Budapest, Hungary).
In *Collection of scientific papers in collaboration with joint Institute for Nuclear Research, Dubna, USSR and Central Research Institute for Physics, Budapest, Hungary. Algorithms and programs for solution of some problems in physics. Vol.IV*, p.85-96. Report KFKI-1983-21, Hungarian Acad. Sci., Budapest (1983), 191 pp.
The authors present the geometric convergence of some two-point Pade approximations on certain infinite sets of the complex plane is considered. (no refs.)

02.20 GROUP THEORY

(for algebraic methods in quantum mechanics, see 03.65; for symmetries in elementary particle physics, see 11.30)

116950 A note on the $K(\pi,1)$ property of the orbit space of the unitary reflection group G (m,l,n). T.Nakamura (Dept. of Math., Univ. of Tokyo, Tokyo, Japan).
Sci. Pap. Coll. Arts & Sci. Univ. Tokyo (Japan), vol.33, no.1, p.1-6 (June 1983). (5 refs.)

116951 Cohomology groups in the Cartesian product of countably infinite number of complex planes. Y.Fujimoto (Dept. of Pure & Appl. Sci., Univ. of Tokyo, Tokyo, Japan).
Sci. Pap. Coll. Arts & Sci. Univ. Tokyo (Japan), vol.33, no.1, p.41-53 (June 1983).
The properties of holomorphic functions on the Cartesian product of countably infinite number of complex planes, which will be denoted by ΠC, have been discussed by many authors. Among others, Rickart (1969) proved that for any polynomially convex compact subset Ω of ΠC $H^k(\Omega,O)=0$ for $k\geq 1$ by using a theorem on sheaves represented as the inductive limit of some sheaves. On the other hand, Dineen (1976) proved that for any open set U in ΠC, $H^1(U,O)\neq 0$ by showing that the first Cousin problem is not solvable on U. The author introduces a fine subsheaf $\mathcal{E}_b$ of the sheaf of infinitely differentiable functions on ΠC. Then, it is shown that there is a fine resolution of the sheaf O on ΠC. (9 refs.)

116952 Standard Young tableaux and weight multiplicities of the classical Lie groups. R.C.King, N.G.I.El-Sharkaway (Faculty of Math. Studies, Univ. of Southampton, Southampton, England).
J. Phys. A (GB), vol.16, no.14, p.3153-77 (1 Oct. 1983).
By examining the branching rules for all irreducible representations of the classical groups U(k), SU(k), SO($2k+1$), Sp($2k$) and SO($2k$) on restriction to U(1)×U(1)×U(1), standard Young tableaux are specified for each of these groups. It is shown that these tableaux determine the corresponding characters of the irreducible representations. The rules for constructing these tableaux are derived and in this way the determination of weight multiplicities is reduced to a simple combinatorial exercise. General formula for such weight multiplicities are given encompassing the most difficult case: namely that of SO($2k$). Illustrative examples are provided, including some yielding the explicit k-dependence of weight multiplicities. (29 refs.)

116953 The Gel'fand basis and matrix elements of the graded unitary group U(m/n). J.-Q.Chen, X.-G.Chen (Dept. of Phys., Nanjing Univ., Nanjing, China).
J. Phys. A (GB), vol.16, no.15, p.3435-56 (21 Oct. 1983).
Projection operators with correct normalisation are constructed for obtaining the Gel'fand basis $|(^{[\nu]}{}_{(m)})\rangle$ of the graded unitary group U(m/n). Each U(m/n) Gel'fand basis vector $|(^{[\nu]}{}_{(m)})\rangle$ for an f-particle system uniquely corresponds to a non-standard basis vector $|[\nu](m)\rangle$ of the permutation group S(f). The matrix element of the generator $E^{i-1}{}_{i}$ of U(m/n) between the two Gel'fand basis vectors $|(^{[\nu]}{}_{(m)})\rangle$ and $|(^{[\nu]}{}_{(m)})\rangle$ is proportional to the overlap between the two non-standard basis vectors $|[\nu](m')\rangle$ and $|[\nu](m)\rangle$ of S(f). Explicit formulae are given for the normalisation constant in the projection operator as well as for the matrix elements of the generator $E^{i-1}{}_{i}$ of the graded unitary group U(m/n), which is the extension of the Gel'fand-Tsetlin formula for the ordinary unitary group U(m). (22 refs.)

116954 Supergroups have no extra topology. R.F.Picken (Inst. fur Theorie der Elementarteilchen, Freie Univ. Berlin, Berlin, Germany).
J. Phys. A (GB), vol.16, no.15, p.3457-62 (21 Oct. 1983).
The global topology of supergroups is studied and it is found that they are equivalent as far as homotopy is concerned to the product of the underlying ordinary Lie groups. (4 refs.)

116955 Kac-Dynkin diagrams and supertableaux. J.Bars (CERN, Geneva, Switzerland), B.More, H.Ruegg.
J. Math. Phys. (USA), vol.24, no.9, p.2253-62 (Sept. 1983).
Shows the relation between Kac-Dynkin diagrams and supertableaux. (14 refs.)

116956 The SO(7) polynomial basis for symmetric representations. P.De Wilde, H.De Meyer, G.Vanden Berghe (Seminarie voor Wiskundige Natuurkunde, Rijksuniv. Gent, Gent, Belgium).
J. Math. Phys. (USA), vol.24, no.9, p.2263-5 (Sept. 1983).
A polynomial basis is derived for the symmetric irreducible representations of the group SO(7). The reduction of SO(7) into $[SU(2)]^3$ is considered. The SO(7) generators not belonging to $[SU(2)]^3$ are grouped into a bispinor vector, of which matrix elements are calculated. An explicit expression for the state vector is given. (5 refs.)

116957 A new approach to permutation group representations. II. Cheng-Jiu Zhu (Phys. Dept., Jilin Univ., Changchun, China), Jin-Quan Chen.
J. Math. Phys. (USA), vol.24, no.9, p.2266-7 (Sept. 1983).
For pt.I see ibid., vol.23, p.928 (1982). The formula for the Yamanouchi matrix elements is rederived by the eigenfunction method in a simple fashion. (8 refs.)

116958 A deformation of the general zero-curvature equations associated to simple Lie algebras. B.Kupershmidt (Los Alamos Nat. Lab., Los Alamos, NM, USA), D.Peterson.
J. Math. Phys. (USA), vol.24, no.9, p.2296-300 (Sept. 1983).
Constructs deformations and rational reductions for all the general zero-curvature equations associated to simple complex Lie algebras [known as AKNS equations for sl(2,C)]. (7 refs.)

02.30 FUNCTION THEORY, ANALYSIS

116959 Justification of the averaging method for functional-differential equations with maximums. D.D.Bainov, S.D.Milusheva.
Hadronic J. (USA), vol.6, no.4, p.1034-9 (July 1983).
The averaging method is justified for a class of functional-differential equations with maximums. (3 refs.)

116960 Recurrence formula and conserved quantity of the Benjamin-Ono equation. Y.Matsuno (Mitsubishi Heavy Industries Ltd., Nagoya Aircraft Works, Nagoya, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.2955-8 (Sept. 1983).
It is shown, by using a recurrence formula derived from the Backlund transformation of the Benjamin-Ono (BO) equation, that the functional derivative of a conserved quantity of the BO equation is a conserved density.

116961 Single cell high order difference methods for the Helmholtz equation. R.P.Manohar, J.W.Stephenson (Dept. of Maths., Univ. of Saskatchewan, Saskatoon, Saskatchewan, Canada).
J. Comput. Phys. (USA), vol.51, no.3, p.444-53 (Sept. 1983).
A procedure for deriving certain high order difference formulas for the Helmholtz equation is given. Families of formulas of order 2, 4, and 6 are derived. The distinction between 'atomic' and 'nonatomic' formulas is made, and a nonatomic formula of order 4 is given for a similar equation with variable coefficients. Numerical results using these formulas are given. (8 refs.)

116962 Associated Legendre functions on the cut. F.W.Olver (Inst. for Phys. Sci. & Technol., Univ. of Maryland, College Park, MD, USA), J.M.Smith.
J. Comput. Phys. (USA), vol.51, no.3, p.502-18 (Sept. 1983).
Algorithms and a code are described for the computation of the associated Legendre functions, $P_\nu^\mu(\cos\theta)$, $P_\nu^{-\mu}(\cos\theta)$, $Q_\nu^\mu(\cos\theta)$ and the normalized Legendre polynomial $\bar{P}_\nu^\mu(\cos\theta)$ in the ranges $0<\theta\leq{}^1/_2\pi$, $\mu=0,1,2,\ldots$, $-{}^1/_2\leq\nu<\infty$. The algorithms are based on power-series expansions and recurrence relations. They are executed in extended-range arithmetic, thereby admitting very extensive ranges of μ and ν without causing overflow or underflow. (23 refs.)

116963 Periodic solutions of differential equations and one-parameter family of operators. T.Pomentale (European Organization for Nuclear Res., Geneva, Switzerland).
J. Comput. Phys. (USA), vol.51, no.3, p.527-35 (Sept. 1983).
A method for computing bounds to periodic solutions of the system $y'=f(t,y)$, $y,f\in R^n$, f periodic in t with period T, (1) is studied using an integral equation $y=G_\lambda y$ (2), depending on a parameter λ, and whose solutions for each λ are the periodic solutions of (1). λ is then given a value λ_0 so as to determine a set S for which $G_{\lambda 0}S\subset S$. Since $G_{\lambda 0}$ is proved to satisfy Schauder's conditions, then in S there is a solution of (2), i.e. a periodic solution of (1). The method, which evidently also constitutes an existence proof in S, has the peculiarity of being quite general since it can be used to bound other kinds of solutions of the system $y'=f(t,y)$, by simply setting up a different integral equation $y=G_\lambda y$ which possesses the solutions to be bounded. This method has then been used to bound periodic solutions of a system arising from the dynamics of two floating bodies, for which $G_\lambda S\subset S$ has the form of a system of inequalities. (3 refs.)

116964 Application of reciprocal Backlund transformations to a class of nonlinear boundary value problems. C.Rogers (Dept. of Appl. Math., Univ. of Waterloo, Waterloo, Ontario, Canada).
J. Phys. A (GB), vol.16, no.14, p.L493-5 (1 Oct. 1983).
It is shown that reciprocal Backlund transformations may be used to reduce an important class of nonlinear boundary value problems for higher-order nonlinear diffusion equations to linear canonical boundary value problems. (6 refs.)

116965 The geometric theory of deformation and linearization of Pfaffian systems and its applications to system theory and mathematical physics. I. R.Hermann (Assoc. for Phys. & Systems Math. Inc., Brookline, MA, USA).
J. Math. Phys. (USA), vol.24, no.9, p.2268-76 (Sept. 1983).
Many physical and engineering problems lead to the study of the qualitative and geometric properties of differential equations and their solutions as a function of exogeneous parameters. The theory of deformation of geometric structures and pseudogroups initiated by K. Kodaira and D.C. Spencer (1960, 1962) deals with the common mathematical structure underlying these problems. This series of papers will adapt the work in the pure mathematics literature to the needs of the applications, with the emphasis on the theory of deformations of Pfaffian systems. The applied area to be emphasized in this first part is the theory of nonlinear input-output systems. The author will also present the abstract algebraic structure which seems to underlie the theory of Pfaffian systems, which he calls Cartan-Vessiot filtrations of Lie algebras. (47 refs.)

116966 Painleve property and multicomponent isospectral deformation equations. D.V.Chudnovsky, G.V.Chudnovsky (Dept. of Maths., Columbia Univ., New York, NY, USA), M.Tabor.
Phys. Lett. A (Netherlands), vol.97A, no.7, p.268-74 (12 Sept. 1983).
The Painleve property for partial differential equations proposed by Weiss, Tabor and Carnevale (see J. Math. Phys., vol.24, p.522, 1982) is studied for two and three-dimensional multicomponent and matrix isospectral deformation systems. Applications to pole dynamics are presented. (23 refs.)

116967 A comment on Backlund transformations connected with the Sturm-Liouville operator. W.Strampp, K.-H.Briz (Fachbereich Math., Gesamthochschule Kassel, Kassel, Germany).
Prog. Theor. Phys. (Japan), vol.70, no.1, p.85-92 (July 1983).
There exists a well-known transformation associating different Sturm-Liouville equations. It is shown that this transformation as well applies to equations occuring in the Lax formulation of various nonlinear equations. This leads immediately to bilinear Backlund transformations. (18 refs.)

116968 **ω-complete A-spaces.** Yu.L.Ershov.
Cybernetics (USA), vol.18, no.6, p.701-5 (Nov.-Dec. 1982). Translation of: *Kibernetika (USSR)*, vol.18, no.6, p.6-9 (Nov.-Dec. 1982). [received: Sept. 1983]
This article shows that a weaker condition of ω-completeness is sufficient for most of the results obtained for complete A-spaces. (6 refs.)

116969 **New method for calculating stable and unstable periodic orbits of one-dimensional maps.** H.Kaplan (Dept. of Phys., Syracuse Univ., Syracuse, NY, USA).
Phys. Lett. A (Netherlands), vol.97A, no.9, p.365-7 (26 Sept. 1983).
A new iterative method of calculating periodic orbits of one-dimensional maps is presented, based on a lemma of Metropolis, Stein and Stein (1973) with accelerated convergence based on Feigenbaum's scaling hypothesis (1978). The author is able to calculate global bifurcation diagrams, including unstable branches. (4 refs.)

116971 **An analysis of two-step time discretizations in the solution of the linearized shallow water equations.** M.G.G.Foreman (Inst. of Ocean Sci., Sidney, British Columbia, Canada).
J. Comput. Phys. (USA), vol.51, no.3, p.454-83 (Sept. 1983).
A Fourier analysis for evaluating the accuracy of finite element methods which solve the linearized shallow water equations is extended to include group velocity. The technique is first applied to the selection of a spatial discretization and then, assuming a specific finite element discretization, to finding the most accurate two-step time stepping method. 03.00 CLASSICAL AND QUANTUM PHYSICS; MECHANICS AND FIELDS

03.20 CLASSICAL MECHANICS OF DISCRETE SYSTEMS: GENERAL MATHEMATICAL ASPECTS

(for applied classical mechanics of discrete systems, see 46.10; for celestial mechanics, see 95.10)

116972 Time integration of the equations of motion of a structural system including damping. G.R.Heppler, J.S.Hansen (Univ. of Toronto, Toronto, Canada).
AIAA J. (USA), vol.21, no.9, p.1301-9 (Sept. 1983).
The conditions required to achieve the unconditional spectral stability for damped linear elastic structural systems are determined in closed form for several linear single-step implicit temporal operators. The results obtained include the effect of system damping on algorithmic damping, on relative period errors, and on the spectral radius of each operator. It is found that inclusion of systen damping results in more algorithmic damping in the low-frequency modes than in the high-frequency modes and it also causes a tendency to overshoot the exact response as compared to the undamped case. Based on the above, recommendations are made with regard to the choice of integration parameters for each operator. (17 refs.)

116973 Nonlinear inverse perturbation method in dynamic analysis. K.-O.Kim, W.J.Anderson, R.E.Sandstrom (Univ. of Michigan, Ann Arbor, MI, USA).
AIAA J. (USA), vol.21, no.9, p.1310-16 (Sept. 1983).
An analytical method is presented for the automated redesign of the model characteristics of undamped mechanical systems. The method is based on a perturbation of the eigensystem, and all nonlinear terms are carried so that large exchanges can be considered. The user requests frequency and mode shape changes. The structural changes are expressed through design parameters α_i representing conventional thicknesses, moments of intertia, etc. A penalty function method is used in which the original objective function is a minimum weight condition and the penalty term is a properly normalized set of residual nodal force errors. Solutions converge well for typical example problems using five cycles of the conjugate gradient method. The method is superior to linear methods, which have shown error when significant mode shape changes are required. It is believed to be computationally superior to series solutions, such as Taylor's series when only one or two frequencies and mode shapes are of interest. In addition, the method is not subject to a limited radius of convergence in the design variables as is encountered in series solutions. (15 refs.)

116974 Logicoalgebraic approach to Lagrangian systems. F.Barone, R.Grassini (Inst. of Math., Naples Univ., Naples, Italy).
Int. J. Theor. Phys. (USA), vol.22, no.9, p.829-36 (Sept. 1983).
A logicoalgebraic approach to the geometry of Lagrangian systems is pursued by starting axiomatically with a classical mechanical system whose logic is a separable and atomic Boolean σ algebra. (6 refs.)

116975 Monotonicity of energy eigenvalues for Coulomb systems. R.Eiglisch (Sektion Phys., Karl-Marx-Univ. Leipzig, Leipzig, Germany).
J. Phys. A (GB), vol.16, no.14, p.3179-91 (1 Oct. 1983).
Generalising results by Reed/Simon and Thirring, the author proves for a large class of Hamiltonians (among others, Hamiltonians of Coulomb systems) which can be written in the form $H(\alpha)=H_0+\alpha H'$ that their eigenvalues decrease with increasing α. The author applies this result to Coulomb systems in which the distances between the infinitely heavy particles are varying and also use it to obtain a completion and simplification of Adamowski et al.'s proof for the stability of the biexciton. (20 refs.)

116976 A new class of integrable systems. B.Dorizzi, B.Grammaticos (Dept. de Math., CNET, Issy les Moulineaux, France), A.Ramani.
J. Math. Phys. (USA), vol.24, no.9, p.2282-8 (Sept. 1983).
The authors present a family of dynamical systems associated with the motion of a particle in two space dimensions. These systems possess a second integral of motion quadratic in velocities (apart from the Hamiltonian) and are thus completely integrable. They were found through the derivation and subsequent resolution of the integrability condition in the form of a partial differential equation (PDE) for the potential. A most important point is that the same PDE was derived through considerations on the analytic structure of the singularities of the solutions ('weak-Painleve property'). (11 refs.)

116977 Integrability of Hamiltonians with third- and fourth-degree polynomial potentials. B.Grammaticos, B.Dorizzi (Dept. de Math., CNET, Issy les Moulineaux, France), A.Ramani.
J. Math. Phys. (USA), vol.24, no.9, p.2289-95 (Sept. 1983).
The weak-Painleve property, as a criterion of integrability, is applied to the case of simple Hamiltonians describing the motion of a particle in two-dimensional polynomial potentials of degree three and four. This allows a complete identification of all the integrable cases of cubic potentials. In the case of quartic potentials, although the results are not exhaustive, some new integrable cases are discovered. In both cases the integrability is explicited by a direct calculation of the second integral of motion of the system. (12 refs.)

116978 On the principle of virtual displacements. G.D.Blyumin.
Mech. Solids (USA), vol.17, no.6, p.19-24 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.6, p.22-8 (1982). [received: Oct. 1983]
The formulation of proof of the principle of virtual displacements is generalised to the case of nonstationary and nonholonomic constraints. The author gives examples of problems involving equilibrium of systems with such constraints. (7 refs.)

116979 On the theory of vibrational displacement with nonharmonic excitation. L.V.Bespalova, V.S.Metrikin.
Mech. Solids (USA), vol.17, no.6, p.30-4 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.6, p.34-9 (1982). [received: Oct. 1983]
Considers one problem in the theory of vibrational displacement, namely vibrational insertion (or extraction) of elements under the action of a periodic piecewise-continuous external force. Using the point-transformation method and the solution of the equations describing the dynamics of the process, the authors determine in general form the boundaries of the region of existence of the principal stable periodic motions. The general results obtained can be employed to investigate the dynamics of a system with an impulsive external force with arbitrary relative duration σ. All elementary periodic motions are investigated and exact analytic formulas given for their existence limits. This makes it possible to evaluate the effect of the parameters of the impulsive force on the dynamic characteristics of the process, in particular the effect of the relative duration σ on the optimal amount of insertion. (5 refs.)

116980 Opitmal control of periodic vibrations of a vibration-impact system. A.S.Kovaleva.
Mech. Solids (USA), vol.17, no.6, p.35-42 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.6, p.40-7 (1982). [received: Oct. 1983]
In dealing with problems of periodic optimization, the usual procedure is to write the differential equations of motion of the system, and to consider the periodicity conditions as additional constraints that relate the values of the generalized coordinates at the beginning and end of a period. Solution of these problems becomes much more complicated as the order of the system increases, and effective results have been obtained primarily for systems with one degree of freedom. The motion of a vibration-impact system can be described by one integral equation. To optimize periodic motions of vibration-impact systems the author employs methods used for systems described by integral equations. Some examples are also considered. (9 refs.)

116981 Discrete problem of synthesis of a system of strings. M.D.Dolberg, I.Yu.Chudinovich.
Mech. Solids (USA), vol.17, no.6, p.43-8 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.6, p.48-54 (1982). [received: Oct. 1983]
Deals with the problem of synthesizing a system of interconnected strings with concentrated masses, for which the squares of the vibrational frequencies coincide with the eigenvalues of a specified positive-definite matrix. The authors offer a parametrization of these systems that makes it possible to calculate the spans and masses in explicit form. The parametrization is convenient for solving a number of inverse problems, in particular the problem of reconstructing a system of connected strings on the basis of several spectra of vibrational frequencies, corresponding to different types of attachment of the string ends. (3 refs.)

116982 Many-body forces in directly interacting systems. T.Biswas, F.Rohrlich (Dept. of Phys., Syracuse Univ., Syracuse, NY, USA), M.King.
Nuovo Cimento B (Italy), vol.77B, ser.2, no.1, p.49-61 (11 Sept. 1983).
The conventional formulation of classical relativistic Hamiltonian constraint dynamics of N interacting particles assumes N constraints which are required to satisfy an Abelian Poisson-bracket algebra. This requirement imposes restrictions on the permitted interactions, resulting in many-body forces. These are difficult to compute for given two-body forces. The authors propose a perturbative method for this purpose, which is symmetric in the particles. It requires Poincare-invariant integration, which is discussed in detail. An example is solved explicitly. (14 refs.)

116983 Lagrangian mechanics of massless particles with spin. T.Shirafuji (Dept. of Phys., Saitama Univ., Saitama, Japan).
Prog. Theor. Phys. (Japan), vol.70, no.1, p.18-35 (July 1983).
Lagrangian mechanics of massless particles with spin is studied, based on the interpretation that spin corresponds to displacement in complex directions. Starting with the action integral which ensures the masslessness of particles, two possibilities to introduce spin are investigated. In both cases, the equations of motions cannot fix the world line of massless spinning particles uniquely, due to a 'gauge' invariance property of the action integral. The space-time coordinates are not the most suitable for describing massless spinning particles, but it is convenient to take a pair of spinor variables, i.e. a twistor, as the basic dynamical variables to which the canoical quantization procedure can be applied. In one of the two cases, where massless particles are considered to move in superspace with N spinor coordinates it is found that massless particles form a spin (or helicity) multiplet with the helicity running from $-N/4$ to $+N/4$. (15 refs.)

116984 Necessary and sufficient conditions of reducibility of gauge degrees of freedom without using gauge conditions. R.Sugano (Dept. of Phys., Osaka City Univ., Osaka, Japan).
Prog. Theor. Phys. (Japan), vol.70, no.1, p.36-50 (July 1983).
For dynamical systems described by singular Lagrangian, the conditions under which gauge degrees of freedom can be eliminated by transformations of variables are obtained within the framework of classical dynamics. All the systems whose gauge degrees of freedom are reducible without using gauge conditions may be classified into the following two cases. (i) A weakly reducible case; there exists a canonical transformation by which some of the gauge dependent variables in a Hamiltonian can be separated from other dynamical variables. Hence their gauge degrees of freedom can be completely isolated. (ii) A strongly reducible case; there is a point transformation by which the number of dynamical variables describing a Lagrangian (also a Hamiltonian) of a system can be reducible. Hence the corresponding gauge degrees of freedom are eliminated from the formula. Necessary and sufficient conditions for the reducibility are presented for each case. (9 refs.)

116985 Deliberations on the improvement of the computational model with measured eigenmagnitudes. H.G.Natke (Curt-Risch-Inst. of Vibration & Measurement Technol., Univ. of Hanover, Hanover, Germany).
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.2, p.159-73 (March-April 1983). [received: Sept. 1983]
Up to now it has been usual to measure (identify) eigenmagnitudes of the associated undamped system and a damping ration of each degree of freedom of the system under test. In general these results are erroneous and incomplete. The question arises: what is to be done with these results besides a comparison with the corresponding magnitudes of the computational model? The answer will be discussed in the paper by means of three adjustment methods based on different measured data sets using the weighted least squares method as the estimation procedure. The adjustment is carried out with global factorial parameters of submatrices corresponding to subsystems. Indications are given with regard to applications. (12 refs.)

116986 The confinement of eigenvalues in the case of circular arc vibrations. J.Albrecht (Tech. Univ., Clausthal, Germany).
Z. Angew. Math. & Mech. (Germany), vol.63, no.8, p.387-9 (1983). In German.
The mathematical treatment is carried out on the basis of the Ritz method and Lehmann-Maehly method for the upper and lower limits respectively. Different classes of symmetry are considered and the calculated dependence of minimum eigenvalue on the variable parameter is shown. (9 refs.) *I.G.*

03.30 SPECIAL RELATIVITY

116987 'Optical appearance' of a rolling ring. O.Gron (Inst. of Phys., Univ. of Oslo, Oslo, Norway).
Int. J. Theor. Phys. (USA), vol.22, no.9, p.821-7 (Sept. 1983).
The positions of the points on a rolling ring are calculated at retarded points of time, giving the 'optical appearance' of a rolling ring. (30 refs.)

116988 Extension of relativistic kinematics. T.Aaberge (Dept. de Phys. Theorique, Univ. de Geneve, Geneve, Switzerland).
Int. J. Theor. Phys. (USA), vol.22, no.9, p.851-65 (Sept. 1983).
The author gives an interpretation of the standard coordinates on Minkowski space-time that permits him to introduce an additional invariant time concept. He then considers an alternative set of coordinates and kinematical conservation laws on the resulting 'space-time'. Two conservation laws in addition to those of relativistic kinematics are obtained. The new conservation laws concern the quantities kinematical mass and mass defect, which have been introduced in order to have a more complete description of composite systems. (4 refs.)

116989 Special relativity in observer's time. S.Drobot (Dept. of Math., Ohio State Univ., Columbus, OH, USA).
J. Math. Anal. & Appl. (USA), vol.95, no.2, p.575-96 (Sept. 1983).
The special theory of relativity is reformulated in terms of the observer's time rather than of the proper time. This will make it possible not only to regain (even in a more general form) all known results of relativistic dynamics for a single particle interacting with an electro-magnetic field, but also to formulate the equations of motion for a system of particles interacting with each other and with their electromagnetic fields. This allows to prove conservation laws as first integrals of those equations. Moreover, the initial-value problem for those equations is well defined, although rather difficult to solve in view of the nonlinearity of the equations. (9 refs.)

116990 Fundamental equation of two body problem in relativistic analytical mechanics. N.Ionescu-Pallas (Nat. Center of Phys., Bucharest, Rumania), L.Sofonea.
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.2, p.103-22 (March-April 1983). [received: Sept. 1983]
A rigorous formulation of Invariantive Mechanics in the Hamiltonian version is given. the conditions concerning the inertial motion of the mass center and the mass-energy relationship are expressed by two equations with partial derivatives. An explicit form of the Hamiltonian function for a two body mechanical system is, finally, worked out in the first relativistic approximation. (4 refs.)

03.40 CLASSICAL MECHANICS OF CONTINUOUS MEDIA: GENERAL MATHEMATICAL ASPECTS

116991 Solvability of the Riquier problem for a biharmonic equation in a half-space and boundary conditions for the solutions. V.I.Gorbaichuk.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.7, p.9-13 (1983). In Ukrainian.
Theorems are established on solvability and solution uniqueness for the Riquier problem for a biharmonic equation in a half-plane. Inverse approximation theorems and estimates of solution derivatives are obtained for a tangential direction near the boundary. (9 refs.)

116992 The stability of biparametric damped oscillations. I.Misicu (Polytech. Inst., Bucharest, Rumania).
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.3, p.261-9 (May-June 1983). [received: Sept. 1983]
The author analyses the vibrations corresponding to the biparametric equation of Hill type $d^2x/d\tau^2+(a+2b \cos 2\tau+2c \cos 4\tau)x=0$. The solutions are determined by means of trigonometric expansions. The neutral regions as well as the stability regions in the parametric space are plotted into diagrams using special programming and computerized calculus. The damping effects are also investigated. (12 refs.)

(see also 46.20 Continuum mechanics, and 46.30 Mechanics of solids)

116993 Local energy decay for scattering of elastic waves. G.Dassios (Dept. of Math., Univ. of Patras, Patras, Greece).
J. Differ. Equations (USA), vol.49, no.1, p.124-41 (July 1983).
Shows that if $\mathcal{B}$ is a star-shaped body in R^3 and $\mathbf{u}$ is a solution of the equation of linearized homogeneous isotropic elasticity in the exterior of $\mathcal{B}$ which vanishes on $\partial\mathcal{B}$ and has initially compact support, then the rate of decay of the total elastic energy in any sphere of finite radius is bounded by t^{-1} for large values of the time t. (18 refs.)

116994 A note on the solutions of Boussinesq, Love, and Marguerre in axisymmetric elasticity. D.E.Carlson (Dept. of Theoretical & Appl. Mech, Univ. of Illinois, Urbana, IL, USA).
J. Elasticity (Netherlands), vol.13, no.3, p.345-9 (1983).
The author observes that by writing the displacement equation of equilibrium for homogeneous, isotropic, linear elasticity with zero body force in terms of the dilatation and rotation in the axisymmetric case, one is lead naturally to a complete solution in terms of two displacement potentials. This solution was noted previously by K. Marguerre (1955), but his derivation left its completeness in doubt. While the relationships between the displacement potentials and the displacement components in Marguerre's solution are especially simple, the partial differential equations satisfied by the potentials are coupled. Consequently, it is not surprising that this solution has attracted little attention. The present author uses it to provide economical completeness proofs for the well-known solutions of M. Boussinesq (1885) and A.E.H. Love (1927). (6 refs.)

116995 Rate forms of tensor field defined in nonlinear continuum mechanics. A.Makinouchi.
Rep. Inst. Phys. & Chem. Res. (Japan), vol.59, no.4, p.117-26 (1983). In Japanese.
In order to formulate the elastic-plastic constitutive relation at finite deformation, it is necessary to take a time derivative of the elastic part of constitutive relation which is referred to the plastically deformed configuration. Somewhat complicated kinematics of such a deformation make it difficult to choose a correct rate form of a tensor used in that constitutive relation. Geometrical significance of rate forms of vector field and tensor field including the corotational rate and the convected rate is discussed under a choice of orthonormal base vectors as the basis for three dimensional euclidian point space to give kinematical basis for the elastic-plastic constitutive relation. (12 refs.)

03.40K Waves and wave propagation: general mathematical aspects

(see also 46.30M Mechanical and elastic waves, 43.20 General linear acoustics)

116996 Head-on collisions between solitary surface waves on shallow water: theory and experiment. A.Mo, P.C.Hemmer.
Ark. Fys. Semin. Trondheim (Norway), no.9, p.1-15 (1983).
The interaction of two nonlinear solitary waves on shallow water, propagating in opposite directions, is studied by numerical integration of first-order shallow water equations. The nonlinear increment $n=s_{max}/(s_1+s_2)-1$, which compares the maximum amplitude s_{max} during the interaction, with the amplitudes s_1, s_2 of the separate pulses, is shown to be positive. The two-soliton solution of the Boussinesq equation, for which n is negative, thus gives an unsatisfactory account of head-on collisions of solitary waves on shallow water. The authors have also performed a water-tank experiment to compare laboratory data with the corresponding theoretical prediction. The agreement is satisfactory. (9 refs.)

116997 Diffraction of a planar wave by a structure consisting of an ideally rigid disc and a spherical mirror. S.S.Vinogradov.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.7, p.53-7 (1983). In Ukrainian.
A rigorous solution is obtained for a problem on scalar wave diffraction by a perfectly rigid disc and spherical cap. The solution is expressed as the second type integro-summatory equation in $l_2\times L_2(0, \infty)$. The suggested approach is based on the Abelian integral transform. (8 refs.)

116998 Wave propagation near curvilinear boundaries of viscous piecewise homogeneous media. L.P.Shvets'.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.9, p.40-3 (1983). In Ukrainian.
A problem is formulated and studies are made on the influence of a viscous fluid and an elastic thin shell on the wave propagation near a cylindrical boundary in a peicewise homogeneous viscoelastic space. (7 refs.)

116999 Higher-order parabolic approximations to time-independent wave equations. J.P.Corones, R.J.Krueger (Dept. of Math., Iowa State Univ., Ames, IA, USA).
J. Math. Phys. (USA), vol.24, no.9, p.2301-4 (Sept. 1983).
A sequence of numerically tractable higher-order parabolic approximations is derived for the reduced wave equation in an inhomogeneous medium. The derivation is motivated by a definition of waves propagating in a distinguished direction. For a homogeneous medium these definitions are exact and yield uncoupled, infinite-order parabolic equations which are equivalent to the wave equation. The difficulty of obtaining higher-order parabolic approximations for the elastic wave equation in an inhomogeneous medium is also discussed. (6 refs.)

117000 Simple waves in quasilinear hyperbolic systems. I. Theory of simple waves and simple states. Examples of applications. A.M.Grundland (Dept. of Phys., Inst. of Geophys., Warsaw Univ., Warsaw, Poland), R.Zelazny.
J. Math. Phys. (USA), vol.24, no.9, p.2305-14 (Sept. 1983).
This paper presents a new method of construction of solutions to nonlinear, nonelliptic systems of partial differential equations and especially nonhomogeneous ones. These equations have been considered from the point of view of integral elements. In particular the connections between the structure of the set of integral elements and the possibility of a construction of special classes of solutions have been studied. These classes consist of what is called simple waves and k waves (for homogeneous systems) and simple states (in the case of nonhomogeneous systems). They provide the authors with a possibility for a selection of simple integral elements from the set of all integral elements. Analyses have been performed using differential forms and Cartan theory of system in involution. The problem has been reduced to examining Pfaff forms. The Cauchy problem for Pfaff systems has been formulated and solved using the Riemann function. Some remarks concerning the notion of Backlund transformations for the case of k waves have been formulated. It is shown that, in contrast to simple wave, the simple state has no gradient catastrophy. The technique presented of constructing the solutions in the form of simple states has been illustrated by the examples of Korteweg and de Vries and four-dimensional Klein-Gordon, sine-Gordon and Liouville equations. It has been shown that the known soliton equations are closely connected with the elliptical functions and especially with the P-Weierstrass functions. (36 refs.)

117001 Simple waves in quasilinear hyperbolic systems. II. Riemann invariants for the problem of simple wave interactions. A.M.Grundland (Dept. of Phys., Inst. of Geophys., Warsaw Univ., Warsaw, Poland), R.Zelazny.
J. Math. Phys. (USA), vol.24, no.9, p.2315-28 (Sept. 1983).
For pt.I see ibid., vol.24, p.2305 (1983). In this paper a generalization of the Riemann invariant method to the case of a nonhomogeneous system of equations has been formulated. The authors have discussed in detail the necessary and sufficient conditions for the existence of Riemann invariants. They perform the analysis using the apparatus of differential forms and Cartan theory of systems in involution. The problem has been reduced to examining Pfaff forms. They have considered the connections between the structure of the set of integral elements and the possibility of a construction of special classes of solutions depending on k arbitrary functions of one variable. These solutions can be interpreted physically as the interactions between k simple

waves on a simple state. They have proven that, in the case of interaction of many simple waves described by Riemann invariants, a conservation law for the type and quantity of waves holds. It has been also shown that such a solution, resulting from the interaction of many simple waves propagating on the simple state, decay for a large time in an exact way into simple waves (of the same kind as those entering the interaction) on the state. The Cauchy problem for the nonlinear superposition of k-sample waves has been formulated. A couple of theorems useful for this problem have been given in the Sec. III. The functional properties of the system of equations determining Riemann invariants have been described. The last part of the work contains an analysis of some examples of the solutions of nonhomogeneous magnetohydrodynamic equations from the point of view of the method described above. (27 refs.)

117002 Soliton solutions of the Korteweg de Vries and the Kadomtsev-Petviashvili equations: the Wronskian technique. N.C.Freeman, J.J.C.Nimmo (Dept. of Appl. Maths., Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England).

Proc. R. Soc. London Ser. A (GB), vol.389, no.1797, p.319-29 (8 Oct. 1983).

The well known soliton solutions of the Kadomtsev-Petviashvili equations, (1970), are written in terms of determinants of Wronskian form. by using this compact representation together with the Horota bilinear form (1980) of the equations, it is demonstrated by elementary algebraic methods that the N-soliton solution satisfies the evolution equation and the N and N+1-soliton solutions satisfy the associated Backlund transformation. The relation of these results to the eigensolutions of the inverse scattering method and to the more usual representation of the N-soliton solution is also given. (7 refs.)

117003 Regular solutions of wave equations containing nonlinearities of the type $L\Phi L$. J.Weyer (Dept. Matematica, Univ. de Santiago de Chile, Santiago, Chile).

Proc. R. Soc. Edinburgh Sect. A (GB), vol.95, pt.1-2, p.147-52 (1983).

Regular solutions of the forced nonlinear wave equation $u_{tt}+L^4u+L\Phi Lu=r$ are studied in Hilbert spaces. L is a linear, positive, selfadjoint operator and the nonlinear nucleus $\Phi(u)=f(|u|^2)u$ is generated by a C^1-function f, such that $L\Phi(Lu)=f(|Lu|^2)L^2u$. If the initial value data $u(0)=\phi$ and $u_t(0)=\psi$ belong to the domain $D(L^{k+4})$ and $D(L^{k+2})$, respectively, and if $r\in D(L^k)$, then there is a (global) solution $u(t)$ such that $u\in D(L^{k+4})$, $u_t\in D(L^{k+2})$ and $u_{tt}\in D(L^k)$ for all times t. The abstract result is applied to examples in nonlinear elasticity theory. (15 refs.)

117004 Physical dynamics of solitons. M.J.Rice (Xerox Webster Res. Center, Webster, NY, USA).

Phys. Rev. B (USA), vol.28, no.6, p.3587-9 (15 Sept. 1983).

A collective-coordinate Hamiltonian is derived for a sine-Gordon or ϕ^4 soliton. It describes a material particle whose translational motion is coupled to an internal degree of freedom. The Hamiltonian equations of motion are solved for exactly and show that the 'soliton' may exist in a dynamical state of constant translational momentum and constant total energy with an internal vibration which imparts an oscillatory component to the soliton's translational velocity. (6 refs.)

03.50 CLASSICAL FIELD THEORY

117005 Finite-parameter solution classes for the two-body problem with delay. V.I.Zhdanov.

Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.7, p.13-15 (1983). In Ukrainian.

Solutions of motion equations with delay are studied. They form a family of solutions of a certain system of ordinary differential equations. The results are applied to a two-body problem in classical electrodynamics. (6 refs.)

117006 Dynamical properties of many-dimensional solitons studied by numerical experiments. A.B.Shvachka.

In *Collection of scientific papers in collaboration with joint Institute for Nuclear Research, Dubna, USSR and Central Research Institute for Physics, Budapest, Hungary. Algorithms and programs for solution of some problems in physics. Vol.IV*, p.71-84. Report KFKI-1983-21, Hungarian Acad. Sci., Budapest (1983), 191 pp.

The brief review of the dynamical properties of many-dimensional quasi-solitons studied by means of the computer simulation in the framework of the nonlinear classical field theory models is presented. It is shown that the types of soliton interactions are model independent for studied models. (16 refs.)

03.65 QUANTUM THEORY; QUANTUM MECHANICS

(see also 05.30 Quantum statistical mechanics; for relativistic wave equations, see 11.10)

117007 Quantum tunnelling in a dissipative system. A.O.Caldeira (Univ. Estadual de Campinas, Sao Paulo, Brazil), A.J.Leggett.

Ann. Phys. (USA), vol.149, no.2, p.374-456 (Sept. 1983).

The authors consider the effect of dissipation on quantum tunnelling. It is found that the presence of dissipation causes suppression, and the suppression factor is studied for linear dissipation. The results are applied to the tunnelling of a macroscopic variable, such as the trapped flux in a SQUID. (66 refs.)

117008 Quantum mechanics and macroscopic separability: a critical review. J.L.Sanchez-Gomez, J.M.Sanchez-Ron (Dept. de Fisica Teorica, Univ. Autonoma de Madrid, Madrid, Spain).

An. Fis. Ser. A (Spain), vol.79, no.2, p.85-94 (May-Aug. 1983). [received: Oct. 1983]

The authors discuss the consequences of the Einstein-Podolsky-Rosen theorem concerning the non-separable nature of reality as implied by quantum mechanics. A critical review of several experiments and theoretical ideas dealing with said subject is presented. (62 refs.)

117009 Discrete quantum mechanics. R.Friedberg, T.D.Lee (Columbia Univ., New York, NY, USA).

Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands), vol.B225(FS9), no.1, p.1-52 (3 Oct. 1983).

Recently the possibility was raised that time can be regarded as a dynamical variable. This leads to the formulation of discrete mechanics, with the usual continuum mechanics appearing as an approximation. The difference between these two is examined in this paper. (8 refs.)

117010 Examples of Schrodinger's equation with singular potentials. II. A.M.Eishinskii (Vecernjaja Skola, Dnjepropetrovsk, SSSR).

Fizika (Yugoslavia), vol.15, no.3, p.311-20 (July-Sept. 1983). In Russian.

For pt.I see ibid., vol.13, p.163 (1981). Two examples of one-dimensional Schrodinger equation with strongly singular potentials are considered and solutions vanishing at the origin are constructed using the well-known transcendental functions. (11 refs.)

117011 Reformulating classical and quantum mechanics in terms of a unified set of consistency conditions. R.F.Bordley (Univ. of Michigan, Dearborn, MI, USA).

Int. J. Theor. Phys. (USA), vol.22, no.9, p.803-20 (Sept. 1983).

The author imposes consistency conditions on the path of a particle and shows that they imply Hamilton's principle in classical contexts and Schrodinger's equation in quantum mechanical contexts. The author provides a common, intuitive foundation for classical and quantum mechanics. It also provides a very new perspective on quantum mechanics. (13 refs.)

117012 Coupling of quantum logics. S.Pulmannova (Math. Inst., Acad. of Sci., Bratislava, Czechoslovakia).

Int. J. Theor. Phys. (USA), vol.22, no.9, p.837-50 (Sept. 1983).

A quantum logic is a couple (L, M), where L is a logic and M is a quite full set of states on L. A tensor product in the category of quantum logics is defined and a comparison with the definition of free orthodistributive product of orthomodular σ lattices is given. Several physically important cases are treated. (10 refs.)

117013 The multigrid method for accelerated solution of the discretized Schrodinger equation. F.F.Grinstein, H.Rabitz, A.Askar (Dept. of Chem., Princeton Univ., Princeton, NJ, USA).

J. Comput. Phys. (USA), vol.51, no.3, p.423-43 (Sept. 1983).

The use of the new multigrid method for the numerical solution of the discretized Schrodinger equation is discussed. A simple approach is chosen to circumvent the difficulties associated with the fact that the Schrodinger differential operator is not positive definite. The scheme is applied to a two-dimensional model problem which includes the essential features present in actual scattering problems. The results show that significant savings can be achieved both in computational work and core memory requirements. The multigrid method should greatly increase the utility of meshing procedures for solving the partial differential equations of quantum mechanics. (19 refs.)

117014 Accurate calculation of the eigenvalues of the $x^2+\lambda x^2/(1+gx^2)$ potential. F.M.Fernandez, A.M.Meson, E.A.Castro (INIFTA, La Plata, Argentina).

J. Comput. Phys. (USA), vol.51, no.3, p.519-26 (Sept. 1983).

The authors present an alternative procedure for calculating the eigenvalues of the Schrodinger equation with potential $V(x)$ where $V(x)=x^2+\lambda x^2/(1+gx^2)$. (15 refs.)

117015 The eigenvalues of the bounded λx^{2m} oscillators. R.N.Chaudhuri (Phys. Dept., Visva-Bharati Univ., Santiniketan, India).

J. Phys. A (GB), vol.16, no.14, p.3193-6 (1 Oct. 1983).

The even- and odd-parity eigenvalues of the bounded pure λX^{2m} oscillators are obtained as the roots of two equations derived explicitly. (24 refs.)

117016 Collective rotations of asymmetrically deformed many-body systems. II. Intrinsic symmetry effects. L.F.Lathouwers (Univ. of Antwerp, Antwerp, Belgium).

J. Phys. A (GB), vol.16, no.14, p.3197-205 (1 Oct. 1983).

For pt.I see ibid., vol.15, no.9, p.2785-79 (1982). The implications of intrinsic symmetries on the structure of rotational secular equations in the angular momentum projection formalism are studied for both the exact and approximate versions. The symmetry group of the rigid rotor, D_2, is used to illustrate formal results. (11 refs.)

117017 Separation of centre-of-mass motion for a charged two-body system in a homogeneous magnetic field. D.Baye (Phys. Theorique et Math., Univ. Libre de Bruxelles, Brussels, Belgium).

J. Phys. A (GB), vol.16, no.14, p.3207-18 (1 Oct. 1983).

Exact centre-of-mass separation is performed for the problem of a charged two-body system in a homogeneous magnetic field. Common eigenstates of three exact and approximate constants of motion are constructed in the creation and annihilation operator formalism. Their expression as an infinite series in coordinate representation is obtained using two real linear canonical transformations. An expansion of the wavefunction in this eigenstate basis provides an infinite system of differential equations for the relative motion. This system of equations differs from the infinite nucleus mass approximation by the existence of small terms which couple states with different values of the magnetic quantum number. The usual limitation of the number of electron Landau states leads to a finite number of coupled equations. (19 refs.)

117018 Oscillatory structure of the harmonic oscillator Wigner function. N.Rowley (Niels Bohr Inst., Copenhagen, Denmark).

J. Phys. A (GB), vol.16, no.14, p.3219-36 (1 Oct. 1983).

Some simple closed-form approximations are derived for the oscillatory part of the Wigner function F for a system of degenerate fermions completely filling the first M shells of an oscillator potential in N dimensions. The formalism for a general dimensionality is retained since various properties of the physical case ($N=3$) may be related to similar systems in one dimension higher or lower. In particular the magnitude of the oscillations increases with N, but it is shown that if the last shell is only half filled the structure is decreased to that obtained for a closed-shell system in one dimension lower. The structure is shown to decrease slowly in the 'classical' or 'macroscopic' limit of large particle number, when the density is shown to tend to its Thomas-Fermi value. The formula for the full-shell case is sufficiently simple to generalise to the problem of almost degenerate fermions at a finite temperature T, where it is seen that substantial damping of the oscillations may be obtained for any particle number. An explicit expression for the damping is derived and this implies that for deep-inelastic nuclear reactions at a temperature of around 2 to 3 MeV, considerable structure may still be present in *F*. A simple expression relating the Fermi energy and the particle number of the system at finite temperature is given. (19 refs.)

117019 Harmonic oscillator with variable mass. P.G.L.Leach (Dept. of Appl. Math., La Trobe Univ., Bundoora, Australia).
J. Phys. A (GB), vol.16, no.14, p.3261-9 (1 Oct. 1983).
A general treatment of the quantal harmonic oscillator with variable mass is given. Various examples additional to those obtained by Colegrave and Abdalla for which a closed form solution is possible are given. (11 refs.)

117020 Algebraic quantisation with indefinite metric. P.Broadbridge (Dept. of Math. Phys., Univ. of Adelaide, Adelaide, Australia).
J. Phys. A (GB), vol.16, no.14, p.3271-90 (1 Oct. 1983).
A real symplectic flow may be viewed as being pseudo-unitary, provided there exists a symplectic complex structure *J* which commutes with it. The author determines the class of dynamical systems for which *J* exists. Such systems may be quantised algebraically but the state space may have indefinite metric. This procedure admits a larger class of classical systems than does Segal's algebraic quantisation but there are problems in interpreting the indefinite metric and these are listed and discussed. (34 refs.)

117021 A class of exact solutions for anharmonically coupled oscillators. J.Makarewicz (Inst. of Chem., A Michiewicz Univ., Poznan, Poland).
J. Phys. A (GB), vol.16, no.15, p.L553-7 (21 Oct. 1983).
The author studies the solutions of the two-dimensional Schrodinger equation for anharmonically coupled oscillators. The author obtains a finite set of exact solutions of the form $\psi(x,y)=$polynomial (x,y) exp(polynomial (x,y)) provided that certain constraints on the potential parameters are satisfied. (28 refs.)

117022 On the dynamic symmetry of the stationary Schrodinger equation. L.V.Poluyanov, A.I.Voronin (Inst. of Chem. Phys., Acad. of Sci., Moscow, USSR).
J. Phys. A (GB), vol.16, no.15, p.3409-20 (21 Oct. 1983).
The symmetry of the two- and three-dimensional Schrodinger equation is analysed in terms of second-order differential operators which commute with the Hamiltonian of the solutions of the stationary Schrodinger equation. A set of equations for the coefficients of the symmetry operators is formulated and a general form for the structure of the symmetry operators is obtained. Symmetry operators have been found for the cases of some potentials. The effect of the symmetry raising at zero energy is described. (9 refs.)

117023 Sum rules for harmonic-oscillator brackets. S.Shlomo (Dept. of Phys., Texas A&M Univ., College Station, TX, USA).
J. Phys. A (GB), vol.16, no.15, p.3463-9 (21 Oct. 1983).
A new class of sum rules is derived for the coefficients of the Talmi transformation of the harmonic-oscillator wavefunctions from the single particle coordinates to the relative and the centre-of-mass coordinates. (11 refs.)

117024 Extension of the perturbational-variational Rayleigh-Ritz formalism to large order. J.N.Silverman (Max-Planck-Inst. fur Strahlenchem., Mulheim, Germany).
J. Phys. A (GB), vol.16, no.15, p.3471-83 (21 Oct. 1983).
The previously derived peturbational-variational Rayleigh-Ritz (PVRR) matrix formalism for calculating the Rayleigh-Schrodinger (RS) perturbation series of the normal modes of astrophysical and other classical systems is greatly strengthened so as to make it a powerful tool for applying large-order perturbation theory to the study of both classical and quantum mechanical eigenvalue problems; the underlying generalised Sturm-Liouville type perturbed eigenvalue equation is encountered in many branches of physics. The original formalism is first modified by introducing a number of auxiliary matrixes which render it amenable to the recursive calculation of the RS series of eigenvalues, eigenvectors, and related expectation values. It is then extended to large perturbational order by deriving and incorporating the generalised PVRR remainder and Hellmann-Feynman theorems: these PVRR matrix theorems include the corresponding RS quantum mechanical theorems as special cases. The resultant modified and extended formalism is applicable to an arbitrary Rayleigh-Ritz (linear variational) Ansatz and enables, in a single computer run, the accurate recursive calculation to extremely high perturbational order of the PVRR series of all eigenstates. (43 refs.)

117025 Non-associative properties of a deformed Poisson product and the quantisation problem. C.N.Ktorides, L.C.Papaloucas (Univ. of Athens, Athens, Greece).
J. Phys. A (GB), vol.16, no.15, p.3485-92 (21 Oct. 1983).
The authors discuss the associativity properties of a deformed algebra of phase-space functions, the deformation taken to finite order. They assess the findings in view of a recently proposed quantisation scheme which admits non-associative algebras of operators. They draw a number of conclusions pertaining to the applicability of the deformed algebra for quantum mechanical descriptions. (8 refs.)

117026 The isospectral property for a family of non-self-adjoint operators. H.M.A.de Castro (Inst. de Matematica, Univ. de Sao Paulo, Sao Paulo, Brazil), W.F.Wreszinski.
J. Math. Phys. (USA), vol.24, no.9, p.22787-81 (Sept. 1983).
Proves the isospectral property for certain families of linear non-self-adjoint operators which play a role in inverse scattering theory for a class of nonlinear evolution equations of interest in physics. These include the sine-Gordon and nonlinear Schrodinger equations. (20 refs.)

117027 Generalized stochastic processes and continual observations in quantum mechanics. G.Lupieri (Istituto di Fisica, Univ. di Milano, Milano, Italy).
J. Math. Phys. (USA), vol.24, no.9, p.2329-39 (Sept. 1983).
Gives here a mathematically rigorous form to an earlier work by Barchielli, Lanz, and Prosperi (1982), in which it was found that a generalized stochastic process describes the results of continual observations of the position of a quantum particle. With the help of Albeverio and Hoegh-Krohn's theory (1976) of Feynman path integrals, the author defines the characteristic functional of this process and demonstrates that it possesses the necessary properties of normalization, continuity, and positive definiteness. An explicit calculation of the Feynman path integral which defines the functional allows an analysis of the process to be made. (11 refs.)

117028 Operators for the two-dimensional harmonic oscillator in an angular momentum basis. O.Odundun (Phys. Dept., Univ. of Ife, Ile-Ife, Nigeria).
J. Math. Phys. (USA), vol.24, no.9, p.2340-4 (Sept. 1983).
The forms of the operators $\nu^\dagger,\nu,\lambda^\dagger,\lambda$, which enable one to write the Hamiltonian of the two-dimensional isotropic harmonic oscillator in the form $H=\hbar\omega(2\nu^\dagger\nu+\lambda^\dagger.\lambda+1)$, are presented. Here $\nu^\dagger$ and ν are respectively, the raising and lowering operators for $\nu^\dagger\nu$, the 'radial' quantum number operator, while $\lambda^\dagger$ and λ are, respectively, the raising and lowering operators for *M*, the magnitude of the angular momentum operator. Corresponding to this decomposition of *H* in the angular momentum basis are the energy eigenvalues $E_{km}=\hbar\omega(2k+|\mathrm{m}|+1)$ with $k=0,1,2,\ldots$ and $m=0,\pm1,\pm2,\ldots$. Here *k* is a 'radial' quantum number and *m* is a 'magnetic' quantum number. The commutation relations satisfied by the operators $\nu^\dagger,\nu,\lambda^\dagger$, and λ are also presented. (3 refs.)

117029 A time-dependent Schrodinger equation. H.U.Kranold (Nuclear Dev. Corp. of SA Ltd., Pretoria, S Africa).
J. Math. Phys. (USA), vol.24, no.9, p.2345-7 (Sept. 1983).
Reduces the solution of the Schrodinger equation with the potential $U(r,t)=\alpha_1(t)\mathrm{r}^2+\alpha_2(t)x+\alpha_3(t)y+\alpha_4(t)z+\alpha_5(t)$ to the solution of the Schrodinger equation for a free particle. The $\alpha_i(t)$ are arbitrary functions of time. A generalization of this is also considered. (3 refs.)

117030 *N*-body quantum scattering theory in two Hilbert spaces. III. Theory of approximations. C.Chandler, A.G.Gibson (Univ. of New Mexico, Albuquerque, NM, USA).
J. Funct. Anal. (USA), vol.52, no.1, p.80-105 (1 June 1983).
For pt.II see J. Math. Phys., vol.19, p.1610-16 (1978). A rigorous mathematical theory of approximations is developed for abstract nonrelativistic quantum scattering systems within the two-Hilbert-space framework. An approximate space of asymptotic states and an approximate asymptotic Hamiltonian must be specified initially. An approximate *N*-particle Hamiltonian is then constructed and proved to be self-adjoint. Approximate wave operators are shown to exist and, in certain intereresting cases, to be asymptotically complete. Certain sequences of the approximate wave operations are proved to converge to the exact wave operators in an approximate limit. Thus approximate scattering operators are unitary and converge to the exact scattering operator. (23 refs.)

117031 Propagation properties of quantum scattering states. V.Enss (Inst. for Math., Ruhr-Univ., Bochum, Germany).
J. Funct. Anal. (USA), vol.52, no.2, p.219-51 (15 June 1983).
The change of localization of a scattering state under free and interacting time evolutions for quantum mechanical potential scattering is derived. If a particle of mass *m* is localized in a ball of radius *R* and has energy below $mv^2/2$, then at time *t* the component of the state in the 'forbidden region' $|x|>R+vt$ decays integrably in time. Various sharper estimates for the free time evolution are also derived. The momentum support of a state in terms of its full energy support in regions where the potential is weak is controlled. The potential may be fairly general and of short or long range. (11 refs.)

117032 Krein's formula and one-dimensional multiple-well. J.M.Combes, P.Duclos (Univ. de Toulon et du Var, Marseille, France), R.Seiler.
J. Funct. Anal. (USA), vol.52, no.2, p.257-301 (15 June 1983).
It is shown that all the discrete eigenvalues of a one-dimensional Schrodinger operator with a multiple well potential possess an asymptotic expansion in power of $\hbar^{1/2}$ when $\hbar\rightarrow0$. A formula for all the coefficients of these expansions is given. The method uses two main tools: Perturbation by boundary conditions and exponential decay of eigenfunctions which are developed in this article. As a byproduct of this work, the exponential localization of eigenvectors when ħ goes to zero can be proved. (21 refs.)

117033 Borel summability of divergent Born series. L.Lovitch (Istituto di Fisica, Univ. di Ferrara, Ferrara, Italy), M.F.Marziani.
Nuovo Cimento A (Italy), vol.76A, ser.2, no.4, p.615-26 (21 Aug. 1983).
The Borel summability method is applied to summing diverging Born series obtained from the Lippmann-Schwinger equation for the two-body *T*-matrix with the $^1S_0$ Reid potential. It is found, in practice, that appreciable numerical difficulties prevent its direct application. However, a combination of the first confluent form of the ϵ-algorithm of Wynn with the Borel method is shown to yield a rapidly converging solution of the scattering equations of comparable accuracy to other standard methods. (20 refs.)

117034 Solution of two paradoxes in the quantum theory of unstable systems. M.Bunge (McGill Univ., Montreal, Quebec, Canada), A.J.Kalnay.
Nuovo Cimento B (Italy), vol.77B, ser.2, no.1, p.1-9 (11 Sept. 1983).
Two apparent paradoxes in the quantum theory of unstable systems are discussed and solved. According to one of them all decay processes, regardless of their mechanism, would be exponential under certain very general assumptions. According to the other an unstable system will never decay, provided it is kept under constant observation. The paradoxes are shown to derive from the tacit classical assumption that every unstable thing is always either in the undecayed or in the decayed state. They do not occur as long as the superposition principle is taken seriously and the system is conceived as being normally in a superposition of sharp states. Moreover, the decay is shown to be a continuous process that unfolds regardless of the observations to which the decay products may be subjected. (19 refs.)

117035 Real successive measurements on unstable quantum systems take nonvanishing time intervals and do not prevent them from decaying. M.Bunge (McGill Univ., Montreal, Quebec, Canada), A.J.Kalnay.
Nuovo Cimento B (Italy), vol.77B, ser.2, no.1, p.10-18 (11 Sept. 1983).
An alarming result has been derived in the theory of unstable systems by considering a sequence of instantaneous observations. According to it, continued observation prevents decay. The authors show that this paradox is avoided if the fiction of the instantaneous observation is replaced with the realistic hypothesis that a measurement (hence the corresponding reduction of the wave packet) takes a nonvanishing time interval. They derive the corresponding formulae, first for a single measurement on a single unstable system, then for a sequence of measurements. Actually the results hold not only for measurements but for interactions of all kinds. The upshot is that the lifetime of an unstable system, while depending on its interactions with a second system, cannot be prolonged arbitrarily by mere continued observation. And in any event such a life span is an objective property of the system under investigation. (11 refs.)

117036 Role of certain gradient vector fields in quantum mechanics. M.Nishioka (Dept. of Phys., Faculty of Liberal Arts, Yamaguchi Univ., Yamaguchi, Japan).
Nuovo Cimento B (Italy), vol.77B, ser.2, no.1, p.19-30 (11 Sept. 1983).
Using the complex wave function satisfying the Schrodinger equation the author defines gradient vector fields which will be used to rewrite the quantum-mechanical formulae such as the Schrodinger equation, the continuity equation and the canonical communication relations. With these formulae rewritten by the gradient vector fields, the author obtains correspondence among the quantum-mechanical formulae and the current and the stochastic velocities, the Fokker-Planck equations, the left and right derivatives which Nelson (1967) used for the stochastic quantization. The author makes some comments on the Schrodinger equation in case that a force proportional to the current or to the stochastic velocity is exerted. Next the relativistic case is treated in which, by making use of the complex wave function satisfying the Klein-Gordon equation, gradient vector fields are defined. They play a central role in expressing several important formulae which have close analogy with some formulae appeared in the relativistic Brownian motion. Finally the author studies the Lagrangian density of a massive real scalar field minimally coupled to the gradient vector fields. (7 refs.)

117037 Yes-no experiments and ordered structures in quantum physics. C.Garola, L.Solombrino (Dipartimento di Fisica, Univ. di Lecce, Lecce, Italy).
Nuovo Cimento B (Italy), vol.77B, ser.2, no.1, p.87-110 (11 Sept. 1983).
The authors consider the set E of all the yes-no experiments that can be performed on a given physical system and the related posets $(\mathcal{E},\leq)$ and the 'effects' and $(\mathcal{L},<)$ of the 'propositions', illustrate by means of examples the relations $\leq$ and $<$ and give counterexamples for properties that one might suspect to hold in $(\mathcal{E},<)$; in particular, they show that Mackey's axiom V (1963) does not usually hold either in $(\mathcal{E},\leq)$ or in its greatest subposet $(\mathcal{E}_0,\leq)$ which can be orthocomplemented with standard methods in quantum logic. Following on the suggestions arising from the examples, they associate with every observable T, by means of the concept of 'efficiency', a family E_T of yes-no experiments, hence a family $\mathcal{E}_T$ of effects parametrized by the Borel fuzzy sets on the real line, and show that the description of the effects by means of operators, which is usual in some axiomatic approaches, can be recovered in standard Hilbert-space quantum theory as an immediate consequence of simple, 'intuitive' assumptions on E. This description is used in order to explicitly display (possibly in the presence of superselection rules) some properties of the representations of $(\mathcal{E},\leq)$ and $(\mathcal{L},<)$, and the links between some different axiomatic approaches (in particular, Makey and Piron, 1976). Finally, they point out some mathematical properties of the lattice of the operators that describe $\mathcal{E}_T$. (22 refs.)

117038 Non-perturbative solution of the Bloch-Mathieu Hamiltonian system. Ming-De Dong (Inst. of Theoretical Phys., Acad. Sinica, Beijing, China).
Phys. Lett. A (Netherlands), vol.97A, no.7, p.275-9 (12 Sept. 1983).
A non-perturbative wavefunctions is obtained for the Bloch-Mathieu Hamiltonian system. The explicit expression of the Floquet exponent indicates that the wavefunction depends non-analytically on E and quadratically on V_1, both demonstrating the illegitimacy of the perturbation expansion. The energy band is also given by an analytic expression instead of Kramers' indirect construction. (3 refs.)

117039 On the joint measurement of incompatible observables in quantum mechanics. W.M.De Muynck, J.M.V.A.Koelman (Dept. of Theoretical Phys., Eindhoven Univ. of Technol., Eindhoven, Netherlands).
Phys. Lett. A (Netherlands), vol.98A, no.1-2, p.1-4 (3 Oct. 1983).
Starting from a representation of a quantum-mechanical observable by a positive-operator-valued measure it is derived that if two incompatible observables $\mathcal{A}$ and $\mathcal{B}$ are measured jointly then both the $\mathcal{A}$- and the $\mathcal{B}$-measurement are disturbed. More specific: if the expectation values $\langle\mathcal{A}\rangle$ and $\langle\mathcal{B}\rangle$ are undisturbed then there is a broadening in the probability distributions of both the $\mathcal{A}$- and the $\mathcal{B}$-measurement results. (4 refs.)

117040 Local realism has not been refuted by atomic cascade experiments. T.W.Marshall (Dept. of Math., Manchester Univ., Manchester, England), E.Santos, F.Selleri.
Phys. Lett. A (Netherlands), vol.98A, no.1-2, p.5-9 (3 Oct. 1983).
The authors obtain a local realistic model, involving just one angular hidden variable, giving predictions, for the coincidence counts in atomic cascade experiments, which come extremely close to those of the quantum-mechanical model, and which fit the experimental data as closely as do the predictions of that model. (19 refs.)

117041 Vortex, spin and triad for quantum mechanics of spinning particle. I. General theory. T.Takabayasi (Dept. of Phys., Nagoya Univ., Nagoya, Japan).
Prog. Theor. Phys. (Japan), vol.70, no.1, p.1-17 (July 1983).
It is shown that a natural extension of the hydrodynamical formalism of quantum mechanics for a Schrodinger particle to include vortical flows leads to the hydrodynamical formalism of quantum mechanics for a spinning particle. This latter formalism is then analysed in regard to its characteristic features, especially the subsidiary condition connecting the vorticity of flow with the inhomogeneity of spin field and the existence of spin stress. Also the formalism is brought to completion by establishing the global condition that quantizes circulation around a singular vortex line. The geometro-hydrodynamical formalism which is equivalent to the above hydrodynamical formalism but introduces a triad structure underlying the classical spin is reconstructed on its own footing. The geometrical property of the triad implies the invariance of theory with respect to the rotation of each triad around its symmetry axis by an arbitrary angle, and this necessitates the introduction of the electromagnetic potential, providing the geometrical interpretation of local gauge invariance. Applications of theory to various special cases and typical examples are deferred to Part II. (15 refs.)

117042 Density dynamics: a generalization of Hartree-Fock theory. D.J.Rowe, M.Vassanji (Dept. of Phys., Univ. of Toronto, Toronto, Ontario, Canada), G.Rosensteel.
Phys. Rev. A (USA), vol.28, no.4, p.1951-6 (Oct. 1983).
The authors show that to any Lie algebra of observables in quantum mechanics there corresponds a system of densities, of which the one-body densities are just one example. These densities may correspond to a single pure state or to an ensemble of states. Like the one-body densities, they support a Hamiltonian dynamics of the time-dependent Hartree-Fock type, which can be applied, for example, to collective motions where the collective states of interest may be either more or less general than single Slater determinants. The dynamics can also be applied to the average dynamics of an ensemble of states. (6 refs.)

117043 Quantum states of two particles on concentric spheres. G.S.Ezra, R.S.Berry (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA).
Phys. Rev. A (USA), vol.28, no.4, p.1989-2000 (Oct. 1983).
The model of two particles on a sphere is extended to two particles on concentric spheres (POCS). The quantum states are found for two electrons, one on a sphere of radius 10 a.u. (simulating the shell $n=3$ in He) and the other, on spheres of 10, 15, 25, 50, and 100 a.u. The eigenvalues and densities $\rho(\theta_{12})$ exhibit a transition from collective, moleculelike behavior to independent-particle-like behavior with Russell-Saunders coupling. The parallel problem of two particles with electron masses interacting via a repulsive Gaussian potential is also treated and a similar transition from collective to independent-particle behavior found. The principal difference between the two cases is only the region of radius of the larger sphere where the transition occurs. (18 refs.)

117044 Quantum nondemolition measurements via quadratic coupling. G.J.Milburn, D.F.Walls (Phys. Dept., Univ. of Waikato, Hamilton, New Zealand).
Phys. Rev. A (USA), vol.28, no.4, p.2065-70 (Oct. 1983).
The authors consider making quantum nondemolition measurements on a harmonic oscillator by coupling it to an oscillator readout system using a four-wave-mixing interaction. The quantum nondemolition variable of interest appears as a nonlinear function of the number operator. It has the form $D_1(t)=\cos(\chi a^{\dagger}at)$. A sequence of measurements of this operator may be made with completely predictable results. The possible use of this system to detect gravitational radiation is suggested. (10 refs.)

117045 L^2-lower bounds to solutions of one-body Schrodinger equations. R.Froese, I.Herbst (Inst. Mittag-Leffler, Djursholm, Sweden), M.Hoffmann-Ostenhof, T.Hoffmann-Ostenhof.
Proc. R. Soc. Edinburgh Sect. A (GB), vol.95, pt.1-2, p.25-38 (1983).
The asymptotic behaviour of L^2-solutions of one-body Schrodinger equations $(-\Delta+V-E)\psi=0$ in $\Omega_R=\{x\in R^n \mid |x|>R\}$ is investigated. The authors show, for example, that if V tends to zero in a certain sense for $|x|\rightarrow\infty$, then either $|x|^{\gamma}\exp\left(\sqrt{(\max(0,-E))}|x|\right)\psi\notin L^2(\Omega_R)$ for some $\gamma>0$ or ψ has compact support. Related results are given for potentials tending to infinity for $|x|\rightarrow\infty$. (18 refs.)

117046 Bloch waves and multiparameter spectral theory. B.P.Rynne, B.D.Sleeman (Dept. of Math. Sci., Univ. of Dundee, Dundee, Scotland).
Proc. R. Soc. Edinburgh Sect. A (GB), vol.95, pt.1-2, p.73-93 (1983).
The authors study the spectral theory of a multiparameter system of periodic Schrodinger operators. Bloch waves are generalized eigenfunctions of these operators and are used to give eigenfunction expansion theorems and to derive some properties of the spectrum of the system. (15 refs.)

117047 Polarization of a bound particle having a large angular moment. A.M.Dmitriev.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.74-8 (Aug. 1983). In Russian.
Splitting of the l-level of a particle bound by an arbitrary central potential is shown to coincide with character of splitting of the three dimensional rotator level with radii r_l of the order of the pit dimension. Dependence of r_l on l and the binding energy of the particle is discussed. (3 refs.)

117048 Quantum particle energy levels asymptotics in electrical and strong magnetic fields. S.N.Solnyshkin.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.78-80 (Aug. 1983). In Russian.
Quantum particle motion is considered in electrical and homogeneous magnetic fields. The asymptotics of energy levels in high magnetic fields is obtained. These results are applied to the hydrogen molecular ion. (9 refs.)

117049 Quantum scattering and scattering of electromagnetic waves by unbounded obstacles. E.M.Il'yin.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.80-2 (Aug. 1983). In Russian.
The problem of asymptotic completeness in scattering by unbounded obstacles is studied. Two cases of electromagnetic wave scattering are investigated as well as quantum scattering of three particles in the hard core model. (3 refs.)

03.80 GENERAL THEORY OF SCATTERING

(see also 11.20 S-matrix theory, and 11.80 Relativistic scattering)

117050 The inverse scattering problem for perturbed wave equations. P.L.Trudinger (Dept. of Pure Maths., Univ. of Sydney, Sydney, Australia).
Arch. Ration. Mech. & Anal. (Germany), vol.81, no.3, p.245-77 (1983).
The inverse problem in scattering theory is the problem of characterising the scatterer from knowledge of the scattering operator. The author shows how the convex hull of the support of the scatterer may be recovered for two systems characterized by the equations $u_{tt}=\Delta u-qu$ and $u_{tt}=a\nabla.b\nabla u$ in $\mathbf{R}^3$. Here a and b are taken to be smooth positive functions, and q is square integrable. (11 refs.)

117051 Analytical expression for the double-frequency Coulomb Green's function with explicitly separated singularities. S.O.Shadchin, V.F.Kharchenko.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.9, p.59-62 (1983). In Ukrainian.
A problem is considered on the off-shell Coulomb scattering of two particles. A new analytical expression for the two-particle Coulomb Green's function with explicitly separated singularities in variables of the transferred momentum and energy is obtained in the case of negative energy. (12 refs.)

117052 L^2 discretization and complex coordinates in the calculation of bound-free amplitudes in the presence of long-range forces. B.R.Johnson (Dept. of Chem., Univ. of Colorado, Boulder, CO, USA), W.P.Reinhardt.
Phys. Rev. A (USA), vol.28, no.4, p.1930-44 (Oct. 1983).
The formalism of Moller wave operators is shown to provide a stable basis for computation of bound-free transition amplitudes for both short- and long-range potentials without the direct calculation of scattering wave functions. This method, which relies on the techniques of expansion in finite L^2 bases and rotation of the coordinates into the complex plane, is applied to both an exponential potential and one that behaves asymptotically as $-1/r^4$. It is demonstrated that one obtains not only accurate magnitudes of the matrix elements, but accurate phases (i.e. the scattering phase shift) as well. Some relevant theoretical results with regard to the application of wave operators are also presented. Although couched in terms of potential scattering, the procedures are readily extendible to multichannel problems. (58 refs.)

117053 Application of the theory of generalized rays to diffractions of transient waves by a cylinder. Y.H.Pao, G.C.C.Ku (Dept. of Theoretical & Appl. Mech., Cornell Univ., Ithaca, NY, USA), F.Ziegler.
Wave Motion (Netherlands), vol.5, no.4, p.385-98 (Aug. 1983).
The theory of generalized rays was developed to analyze transient waves in layered media where incident circular or spherical waves are reflected and

refracted by plane boundaries. The theory has been recently extended to analyze the diffraction of transient waves by a spherical or a cylindrical boundary. The generalized ray integrals, which represent the Fourier transformed diffracted waves, are formulated for the diffraction of an incident spherical pulse by a circular cylinder. The ray integral involves a double integration with respect to two variables of wave slowness. Through a simultaneous transformation of variables, the inverse Fourier transform of these double integrals are completed by applying the Cagniard method. (12 refs.)

117054 Space-time integral equation solution for hard or soft targets in the presence of a hard or soft half space. C.L.Bennett, H.Mieras (Systems Applications, Sperry Res. Center, Sudbury, MA, USA).
Wave Motion (Netherlands), vol.5, no.4, p.399-411 (Aug. 1983).
The responses of a hard or soft target in the presence of a hard or soft half space are computed using space-time integral equations formulated in the time domain. The incident pressure wave is a 'smoothed impulse' with a Gaussian-shaped time dependence, whose width is of the order of a target dimension. A space-time integral equation; for the pressure field and the gradient pressure field on the outside of the target surface is solved for the pressure and the pressure gradient by stepping on in time. The scattered field is then computed from these source fields. The technique is applicable to targets of arbitrary contour and is demonstrated for a sphere and right-circular cylinder at various locations relative to the half space. (7 refs.)

117055 The optical scalars in Kerr-Schild-type spacetimes. B.C.Xanthopoulos (Dept. of Phys., Univ. of Crete, Iraklion, Greece).
Ann. Phys. (USA), vol.149, no.2, p.286-95 (Sept. 1983).
The optical scalars are defined and the optical equations are derived for a null, geodesic, but not necessarily affinely parametrized, vector field. The optical scalars are left invariant under the action of a Kerr-Schild transformation $\hat{g}_{ab}=g_{Ab}+l_a l_b$. The optical equations are integrated explicitly in Kerr-Schild spacetimes. As an application, the search for Kerr-Schild-type N spacetimes with twisting rays is formulated. (14 refs.)

117056 On the exterior solutions of a charged mass point in gauge theories of gravitation. Y.Z.Zhang (Inst. of Theoretical Phys., Acad. Sinica, Peking, China).
Commun. Theor. Phys. (China), vol.2, no.3, p.1161-3 (1983).
In a case of spherically symmetric and static fields, exterior solutions of a charged mass point for the nine-parameter $R+R^2$ gravitational theories are investigated. The author finds that in the case of the coupling constant $(2p-2r+s)=0$, the solution without torsion is the Reissner-Nordstrom metric, but otherwise there is no solution with vanishing torsion. (4 refs.)

117057 A new interior solution of Einstein's field equations for a spherically symmetric perfect fluid in shear-free motion. H.Stephani (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).
J. Phys. A (GB), vol.16, no.15, p.3529-32 (21 Oct. 1983).
Although spherically symmetric expanding (or contracting) stars are a very important class of objects for the application of general relativity theory, only very few perfect fluid solutions of Einstein's equations have been found so far. A new class of exact solutions is presented which contains two arbitrary functions of time and one additional parameter. (4 refs.)

117058 On rotating charged dust in general relativity. V. J.N.Islam (Dept. of Maths., City Univ., London, England).
Proc. R. Soc. London Ser. A (GB), vol.389, no.1797, p.291-8 (8 Oct. 1983).
For pt. IV see ibid vol.385, p.189, (1983). Finds an exact cylindrically symmetric stationary exterior solution of the Einstein-Maxwell equations. The author then matches this solution smoothly onto an interior solution for rotating charged dust found earlier by the author. The solution thus obtained is regular and well behaved inside the matter. Such matched solutions are rare either for the Einstein or Einstein-Maxwell equations. Some properties of the solution are discussed. (9 refs.)

117059 Fluctuations in the general relativistic theory of fluids and solids. N.Salie, R.Wulfert, W.Zimdahl (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).
J. Phys. A (GB), vol.16, no.15, p.3533-43 (21 Oct. 1983).
A formalism to describe small random fluctuations in general relativistic continuous media is presented. It is based on the scheme of general relativistic irreversible thermodynamics and follows the lines of the non-relativistic theory of hydrodynamic fluctuations by Landau and Lifshitz (1957, 1966). In a natural way Einstein's field equations and the equation of motion take a form which in principle allows one to calculate the mean behaviour and the correlation functions of any physical quantity of the theory. As an example fluctuations of a long thin bar under the influence of weak gravitational fields are treated. (19 refs.)

04.50 UNIFIED FIELD THEORIES AND OTHER THEORIES OF GRAVITATION

117060 Comments on the Rainich-Misner-Wheeler theory in Euclidean gravity. M.Przanowski (Inst. of Phys., Tech. Univ. Lodz, Poland).
Acta Phys. Pol. B (Poland), vol.B14, no.9, p.663-9 (Sept. 1983).
The 'already unified field theory' of the electromagnetic and gravitational fields with a cosmological term on a four-dimensional Riemannian manifold with a positive definite metric is proposed. (9 refs.)

117061 'What God hath put asunder, let no man join together'. The grand unification problem. H.-J.Treder (Einstein Lab., Potsdam-Babelsberg, Germany).
Astron. Nachr. (Germany), vol.304, no.4, p.145-51 (1983). In German.
Reviews attempts which have been made to combine the gravitational and electromagnetic fields into a single physical theory. Mentions the ideas of Lorentz, Einstein, Eddington, Weyl, Heisenberg and Pauli, and includes a comment by Lenin. The unification problem in this form remains unsolved. (29 refs.) *G.F.F.*

117062 Instantons in Kaluza-Klein theories. S.M.Barr (Dept. of Phys., Univ. of Washington, Seattle, WA, USA).
Phys. Lett. B (Netherlands), vol.129B, no.5, p.303-6 (29 Sept. 1983).
In a six-dimensional theory of gravity the author finds an instanton solution to Einstein's equations. The extra two dimensions are compactified into a sphere, S^2. Within a Kaluza-Klein ansatz the theory thus reduces at long distance to an SO(3) gauge theory in four dimensions. These solutions are the analogues of the BPST instantons. The existence of such solutions in six-dimensional gravity is a consequence of the conformal properties of the BPST instanton. (7 refs.)

117063 Obtaining charged particles as singularities in a topologically nontrivial Kaluza-Klein world. Hong-Mo.Chan, A.J.Murphy, SheungTsun.Tsou.
Report RL-83-070, Rutherford Appleton Lab., Chilton, Oxon., England (Aug. 1983), 10 pp.
By relaxing the Kaluza-Klein ansatz of a compactified fifth dimension from a global to a local requirement, one is led to a world where space-time automatically admits topological singularities characterised by a conserved and quantised charge. By virtue merely of their topological nature, these singularities acquire an interaction with the Einstein-Maxwell field which is to all appearances identical to that of a classical charged particle. (7 refs.)

04.60 QUANTUM THEORY OF GRAVITATION

117064 Locally Kahler gravitational instantons. M.Przanowski (Inst. of Phys., Tech. Univ., Lodz, Poland), B.Broda.
Acta Phys. Pol. B (Poland), vol.B14, no.9, p.637-61 (Sept. 1983).
The authors discuss certain properties of locally Hermitian and locally Kahlerian manifolds. It is shown that a manifold is locally Hermitian iff some of its spinorial connection coefficients vanish. Conditions of a similar type are obtained for locally Kahlerian manifolds. Subsequently, locally Kahler-Einstein gravitational instantons are investigated. Their vacuum Einstein equations with the cosmological term have been reduced locally to a single nonlinear equation of the second order for one real function. This, in turn, has enabled the authors to show that any locally Kahler gravitational instanton with $R=-4\Lambda=$const. admits locally a real, source-free Maxwell field which for a Kahler gravitational instanton appears to be global. In the latter case, the Einstein-Maxwell equations have been reduced locally to a single differential equation of the fourth order for one real function. (41 refs.)

117065 Dynamical implementation of the gravitons as Nambu-Goldstone bosons. H.Saller (Max-Planck-Inst. fur Phys. und Astrophys., Munchen, Germany).
Nuovo Cimento A (Italy), vol.76A, ser.2, no.4, p.663-84 (21 Aug. 1983).
General relativity can be considered as a theory with a nonlinear realization of the symmetry $GL_{4,R}$. In analogy to the Nambu-Jona-Lasinio (1961) chiral model, it is shown how the massless gravitons arise in the pair approximation. The ultraviolet divergences of the canonical approaches can be avoided by using fields with anomalous dimensions. Such an approach is suggested by the fact that the tetrads contain also the dilatation Goldstone field which affects the dimensions of the fields involved. The characteristic mass for the $GL_{4,R}$ condensation proves to be the Planck mass, which in turn is also related to the most dangerous consequence of the subcanonical structure, the indefinite metric in state space. The dynamical incorporation of gravity shows a way to determine, by finite gap equations, the ratios of the characteristic masses for the internal breakdowns (e.g. chirality of SU_2) to the Planck mass. (19 refs.)

04.65 SUPERGRAVITY

117066 Supersymmetry and non-compact groups in supergravity. J.Ellis (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA), M.K.Gaillard, M.Gunaydin, B.Zumino.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B224, no.3, p.427-50 (19 Sept. 1983).
The authors study the interplay of supersymmetry and certain non-compact invariance groups in extended supergravity theories (ESGTs). They use the

$N=4$ ESGT to demonstrate that these symmetries do not commute and exhibit the infinite-dimension superinvariance algebra generated by them in the global limit. Using this result, they look for unitary representations of the full algebra. They discuss the implications of the results of the context of attempts to derive a relativistic effective gauge theory of elementary particles interpreted as bound states of the $N=8$ ESGT. (50 refs.)

117067 Seven-spheres from octonions and geometric torsion. J.Lukierski, P.Minnaert (Lab. de Phys. Theorique, Univ. de Bordeaux I, Gradignan, France).

Phys. Lett. B (Netherlands), vol.129B, no.6, p.392-6 (6 Oct. 1983).

The groups SO(7), Spin 7 and three inequivalent representations of the O(8) algebra [two spinorial Spin^R 8, Spin^L 8 and vectorial SO(8) related by a triality relation]. The authors are realized as transforations on the octonionic sphere S^7. The authors consider the coset Spin $7/G_2$ describing S^7 with geometric torsion and three Riemannian S^7: one vectorial [SO(8)/SO(7)] and two spinorial ($\mathrm{Spin}^L 8$/Spin 7, $\mathrm{Spin}^R 8$/Spin 7). Using two non-canonical choices of the connections on Spin $7/G^2$ one obtains either the torsionless $S^7=SO(8)/SO(7)$ or the parallelizable curvatureless seven-sphere. (30 refs.)

(see also 02.50 Probability theory, stochastic processes, and statistics)

05.20 STATISTICAL MECHANICS

117070 Relation between the kinetic method and the correlation-function method for the self-diffusion coefficient. J.L.Cruz (Facultad de Ciencias, Cordoba, Spain), F.Romero, J.Cotrino.

An. Fis. Ser. A (Spain), vol.79, no.2, p.100-5 (May-Aug. 1983). [received: Oct. 1983]

The authors develop a kinetic method to obtain formal expressions, for transport coefficients within the Brussel's group formalism and more specifically within the matrix representation of Liouville's equation introduced by Balescu (1971) which is sufficiently well developed and whose utility has been repeatedly proved. (8 refs.)

117071 Influence of box shape on the hard-disk pressure at high fluid density. W.Schreiner, K.W.Kratky (Inst. fur Experimentalphys., Univ. Wien, Wien, Austria).

Chem. Phys. (Netherlands), vol.80, no.3, p.245-51 (15 Oct. 1983).

The finiteness effects induced by periodic boundary conditions are examined for a hard-disk fluid. Besides the relatively simple N dependence there is a more complicated V dependence. Three different approaches are displayed and contrasted: (i) A rough estimate for the V dependence of the pressure, based on a theoretical equation of state. (ii) a more detailed and expensive treatment of the V dependence by a method due to Pratt and Haan (1981). (iii) MC simulations, intending to evoke V dependence deliberately. The influence of varying box shape and particle number ($N=71$, 72 and 73) is investigated. All simulations have been carried out for high fluid density (packing fraction$=0.648$). Finally, the consistency of these approaches is discussed. (14 refs.)

117072 Generating functional for large-kernel distribution functions in nonequilibrium statistical systems in the region of intense thermal fluctuations. O.A.Grechanii.

Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.9, p.44-8 (1983). In Ukrainian.

A statistical approach is developed to describe a kinetic stage of evolution of nonequilibrium statistical systems with intensive large-scale thermal fluctuations. The approach is based on a construction of the Bogolyubov equation solution with respect to a generating functional that uses a boundary condition of partial correlation weakening. (9 refs.)

Kinetic mean field theories: Results of energy constraint in maximizing entropy ....See Entry 117131

05.30 QUANTUM STATISTICAL MECHANICS

(see also 67. Quantum fluids, and 71. Electron states in condensed matter)

117073 The Fermi-hypernetted-chain method for many-body systems. B.Arntsen, E.Ostgaard.

Ark. Fys. Semin. Trondheim (Norway), no.10, p.1-79 (1983).

The great interest in many-body systems and their physical properties has lead to a strong development of new theories and calculation methods for such problems. A well-known perturbation theory is the Brueckner theory where one starts from the linked Rayleigh-Schrodinger perturbation expansion. The Brueckner theory, however, does not work properly for large densities, and it is developed mainly for Fermi system. Pandharipande (1971, 1973) has, therefore, suggested a method of lowest-order constrained variation (LOCV) which should work for large densities and for Bose systems. The LOCV method is a variational method for the energy. In the LOCV method a 'power-series' expansion for the energy is terminated after the first (two-body cluster) term, which is not well founded on theoretical grounds. To include higher-order terms, the authors consider the Fermi-hypernetted-chain (FHNC) method, which is developed analogously to the hypernetted-chain (HNC) method for classical gases. (21 refs.)

117074 The simulation of quantum systems with random walks: a new algorithm for charged systems. D.Ceperley (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).

J. Comput. Phys. (USA), vol.51, no.3, p.404-22 (Sept. 1983).

Random walks with branching have been used to calculate exact properties of the ground state of quantum many-body systems. A more general Green's function identity is derived which relates the potential energy, a trial wavefunction, and a trial density matrix to the rules of a branched random walk. It is shown that an efficient algorithm requires a good trial wavefunction, a good trial density matrix, and a good sampling of this density matrix. An accurate density matrix is constructed for Coulomb systems using the path integral formula. The random walks from this new algorithm diffuse through phase space an order of magnitude faster than the previous Green's Function Monte Carlo method. In contrast to the simple diffusion Monte Carlo algorithm, it is an exact method. Representative results are presented for several molecules. (19 refs.)

117075 Derivation of the Boltzmann equation for a Fermi gas. N.M.Hugenholtz (Inst. for Theoretical Phys., Univ. of Groningen, Groningen, Netherlands).

J. Stat. Phys. (USA), vol.32, no.2, p.231-54 (Aug. 1983).

The author considers the time evolution of a Fermi gas with two-body interaction. For an initial state ρ which is translation invariant and sufficiently clustering the author puts $H=H_0+\lambda V$, takes the limit $\lambda \rightarrow 0$, $t \rightarrow \infty$ such that $\lambda^2 t=\tau$ and shows that (a) the limiting state ρ_τ does not depend on the p-point correlations of ρ for $p>2$, (b) ρ_τ has vanishing p-point correlations for $p>2$, and (c) the two-point function that determines ρ_τ satisfies the Boltzmann equation. To avoid nonessential technical difficulties, the author considers the case of a Fermi gas on a lattice. (6 refs.)

117076 Nonlinear quantum dynamical semigroups for many-body open systems. R.Alicki, J.Messer (Sektion Phys., Univ. Munchen, Munchen, Germany).

J. Stat. Phys. (USA), vol.32, no.2, p.299-312 (Aug. 1983).

The notion of a nonlinear quantum dynamical semigroup is introduced, and the existence and uniqueness of solutions of the corresponding nonlinear evolution equations are studied in a more abstract framework. The construction of nonlinear quantum dynamical semigroups is carried out for two different mean-field models. First a mean-field coupling between a system of noninteracting subsystems and the bath is investigated. As examples, a nonlinear frictional Schrodinger equation and a model for a quantum Boltzmann equation are discussed. Second, a many-body system with mean-field interaction coupled to a bath is considered. Here, again, the form of the generator is derived; however, it cannot be obtained rigorously, except for some particular examples. Finally, the quantum Ising-Weiss model is briefly studied. (26 refs.)

117077 A Schwinger variational method for the Bloch equation. P.A.Whitlock, M.H.Kalos (Courant Inst. of Math. Sci., New York Univ., New York, NY, USA), G.V.Chester.

J. Stat. Phys. (USA), vol.32, no.2, p.389-405 (Aug. 1983).

A Schwinger variational principle has been derived for use in quantum many-body systems at finite temperatures. The variational principle is a stationary expression for the density matrix which may be iterated to improve an approximate density matrix. It also can be used to find stationary expressions for observables. If an approximate, parametrized density matrix is used, the parameters are varied to find the regions where the variational principle is stationary. The variational density matrix obtained with the optimal parameters can be regarded as optimal for that observable. The method has been applied to two model problems, a particle in a box and two hard spheres at finite temperature. The advantages and shortcomings of the method are discussed. (9 refs.)

117078 Can the velocity autocorrelation function decay exponentially?. M.H.Lee (Dept. of Phys., Univ. of Georgia, Athens, GA, USA).

Phys. Rev. Lett. (USA), vol.51, no.14, p.1227-30 (3 Oct. 1983).

For Hermitian many-body systems, admissable functions for the velocity autocorrelation function form a certain invariant of time. This property originates from a basic recurrence relation. The exponentially decaying function cannot form an invariant and therefore cannot be admissible. (23 refs.)

05.40 FLUCTUATION PHENOMENA, RANDOM PROCESSES, AND BROWNIAN MOTION

117079 Oblique sequential plans for finite-state Markov processes. V.T.Stefanov (Inst. of Maths., Bulgarian Acad. of Sci., Sofia, Bulgaria).

C.R. Acad. Bulg. Sci. (Bulgaria), vol.36, no.6, p.759-60 (1983).

Investigates an M-state Markov process with an unknown intensity matrix. The oblique sequential plans for the process are discussed. For every reasonable subset of the whole natural parametric space. (3 refs.)

117080 Fractal dimensionality and the number of visited sites of the ant in the labyrinth. R.B.Pandey, D.Stauffer (Inst. of Theoretical Phys., Cologne Univ., Koln, Germany).

J. Phys. A (GB), vol.16, no.14, p.L511-13 (1 Oct. 1983).

Monte Carlo studies in three dimensions confirm the hypothesis of Toulouse and Rammal that the number of distinct sites visited by a random walk on a random network at its percolation threshold varies as $(\mathrm{time})^{2/3}$. (13 refs.)

117081 The self-avoiding walk on the honeycomb lattice. J.Adler (Phys. Dept. & Solid State Inst., Technion-Israel Inst. of Technol., Haifa, Israel).

J. Phys. A (GB), vol.16, no.14, p.L515-17 (1 Oct. 1983).

The author analyses the chain generating function for the self-avoiding walk problem on the honeycomb lattice. She uses the exact critical point value of Nienhuis and finds exponent values of $\gamma \sim 1.344$ and $\Delta_1 \sim 0.93$ for the dominant and first confluent exponents. The former value is in agreement with Nienhuis' exact result. Second and third confluent exponents, $\Delta_2 \sim 1.2$ and $\Delta_3 \sim 1.5$, are also identified, these exponents being consistent with Monte Carlo results and Nienhuis' exact irrelevant eigenvalue, respectively. (12 refs.)

117082 Stochastic aspects in the theory of spectral-line broadening. I. Collision time statistics and *N*-perturber limit. G.C.Hegerfeldt, R.Reibold (Inst. fur Theoretische Phys., Univ. Gottingen, Gottingen, Germany).
J. Stat. Phys. (USA), vol.32, no.2, p.313-35 (Aug. 1983).
An atom in a gas or plasma experiences a random potential which gives rise to the so-called pressure broadening. The corresponding line shape is obtained in the usual two-level model by a trace operation from the Fourier transform of $\langle T(t,0)\rangle$, the average of the time-development operator. Under certain technical assumptions it is rigorously shown by probabilistic techniques that $\langle T(t,0)\rangle$ falls off faster than $t^{-3+\epsilon}$ for any $\epsilon>0$, giving a continuous Fourier transform and line shape. An alternative expression is derived for the latter which explicitly displays its positivity and which is a limit over increasing perturber numbers. The latter generalized results of von Waldenfels (1973). (16 refs.)

117083 Stochastic aspects in the theory of spectral-line broadening. II. Noncommutative cluster expansions. G.C.Hegerfeldt, R.Reibold (Inst. fur Theoretische Phys., Univ. Gottingen, Gottingen, Germany).
J. Stat. Phys. (USA), vol.32, no.2, p.337-60 (Aug. 1983).
For pt.I see ibid., vol.2, no.2, p.313-35 (1983). Generalizing ideas of von Waldenfels (1973), the authors develop a systematic procedure to define truncated *n*-point operators which are reminiscent of Ursell functions of statistical mechanics. The truncation procedure is adapted to factorization relations obeyed by the operators in question. The results are applied to spectral-line broadening in plasmas. They derive cluster expansions for the line-shape function in terms of these truncated operators, where the ions are treated quasistatistically. The first order approximation for the line-shape function is discussed. The results are carried over to several moving perturber species, in particular to nonquasistatic ions. (5 refs.)

117084 Shape dependence of correlation times in chaos-induced diffusion. S.Grossmann (Fachbereich Phys., Philipps-Univ., Marburg, Germany), S.Thomae.
Phys. Lett. A (Netherlands), vol.97A, no.7, p.263-7 (12 Sept. 1983).
A one-dimensional discrete-time chaotic system generating a diffusive process with strong correlations between successive steps is considered, as realized in brownian motion with directional persistence (observed e.g. for the motion of infusoriae). The resulting intermittency-like behavior without $1/f$ spectrum may be found in many nonlinear systems with two metastable states. (16 refs.)

117085 Relaxation of systems under the effect of a Gaussian white noise. Kolmogorov backward equation method. K.Kitahara (Inst. fur Festkorperforschung, KFA Julich GmbH, Julich, Germany), K.Ishii.
Prog. Theor. Phys. (Japan), vol.70, no.1, p.312-14 (July 1983).
Exact and explicit results are obtained for the relaxation of a class of nonlinear systems under the effect of a Gaussian white noise with the method of the Kolmogorov backward equation. (15 refs.)

117086 Resistance of random walks. J.R.Banavar, A.Brooks-Harris, J.Koplik (Schlumberger-Doll Res., Ridgefield, CT, USA).
Phys. Rev. Lett. (USA), vol.51, no.13, p.1115-18 (26 Sept. 1983).
Unrestricted lattice random walks in which a unit conductor is placed along each bond traversed are considered. The mean end-to-end resistance is studied as a function of the number of steps in the walk and the spatial dimension. A critical scaling law is found whose exponent is consistently given by four different calculational schemes. (14 refs.)

117087 Formation of fractal clusters and networks by irreversible diffusion-limited aggregation. P.Meakin (Central Res. & Dev. Dept., E.I. du Pont de Nemours & Co., Wilmington, DE, USA).
Phys. Rev. Lett. (USA), vol.51, no.13, p.1119-22 (26 Sept. 1983).
A model for diffusion-controlled aggregation in which growing clusters as well as individual particles are mobile has been investigated. Two versions of the model in which the cluster diffusion coefficient is either size independent or inversely proportional to number of particles (mass) give very similar results. In the limit of low concentration and large system size both models lead to the structures with a fractal (Hausdorff) dimensionality of about 1.45-1.5 in two-dimensional lattice-based simulations. (19 refs.)

117088 Novel superuniversal behavior of a random-walk model. H.E.Stanley, K.Kang, S.Redner, R.L.Blumberg (Dept. of Phys., Boston Univ., Boston, MA, USA).
Phys. Rev. Lett. (USA), vol.51, no.14, p.1223-6 (3 Oct. 1983).
A model of interacting random walks is proposed in which each new site visited has a weight factor p. For $1\leq p\leq\infty$, the model interpolates between purely random walks and self-avoiding walks. When $0<p<1$, the model describes attracting random walks (and also noninteracting random walks on a lattice with static traps), and shares some of the intriguing features of random walks on percolation fractals—e.g. dimension-independent exponents. (11 refs.)

117089 Fractal dimension of strange attractors from radius versus size of arbitrary clusters. Y.Termonia, Z.Alexandrowicz (Polymer Dept., Weizmann Inst. of Sci., Rehovot, Israel).
Phys. Rev. Lett. (USA), vol.51, no.14, p.1265-8 (3 Oct. 1983).
A fractal dimension $D_{F'}$ of strange attractors is estimated as follows. Clusters of n nearest-neighbor points are sampled from a time series; $D_{F'}$ is found from $\bar{R}(D_{F'})\sim n$ where $\bar{R}$ is the average cluster's radius. The estimation of $D_{F'}$ is shown to be especially efficient for high dimensional systems. (17 refs.)

117090 Equivalence between random systems and continuous-time random walk: literal and associated waiting-time distributions. J.W.Haus (Fachbereich Phys., Univ. Essen-Gesamthochschule, Essen, Germany), K.W.Kehr.
Phys. Rev. B (USA), vol.28, no.6, p.3573-5 (15 Sept. 1983).
The authors derive the average waiting-time distribution of a particle that performs a random walk on a linear chain with random nearest-neighbour transition rates from a simple equilibrium consideration and the relation between the waiting-time distribution for the first and all other jumps. They estimate this waiting-time distribution by numerical simulations and find agreement with the analytical results. They further deduce an associated waiting-time distribution from recent results for the effective memory kernel of the disordered chain. The associated waiting-time distribution shows a power-law decay exponent $-^{5}/_{2}$ at long times which is not observed in the above-mentioned waiting-time distribution. They comment on the necessary distinction between the 'literal' and the 'associated' waiting-time distributions. (18 refs.)

117091 The application of Green's function to the investigation of the response of vehicle accelerating over random profile. W.Pekala (Centre of Res. & Dev. of Machines, Gliwice, Poland), J.Szopa.
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.3, p.295-310 (May-June 1983). [received: Sept. 1983]
Presents the application of Green's function to determine the probabilistic characteristics of solutions of stochastic linear equations with coefficients variable in time, random initial conditions and random excitations. The method is applied to calculate the variances of vertical vibrations of two-degree-of-freedom vehicle model (or suspension) accelerated over random profile. (27 refs.)

117092 Markovian fluctuation-dissipation theory of open radiophysical systems. R.L.Stratonovich (Moscow State Univ., Moscow, USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.7, p.559-69 (July 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.7, p.779-90 (July 1982). [received: Sept. 1983]
An equality expressing the time reversibility of processes in Markovian open systems is derived. The reciprocity relations for processes involving relaxation to a nonequilibrium stationary state are analyzed. An equation is derived that describes the nonequilibrium stationary distribution for mixed open systems. (7 refs.)

117093 Behavior of the derivative of a random process at the times of crossing a given level. V.I.Khimenko (Inst. of Aircraft Instrumentation, Leningrad, USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.7, p.575-81 (July 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.7, p.797-804 (July 1982). [received: Sept. 1983]
The distribution of the derivative of a continuous differentiable random process at the time when it crosses a certain given level is investigated. Simple analytical expressions are derived for the conditional probability density functions. The results are particularized for some of the most common non-Gaussian processes. All the distribution functions are represented as the ratios of the probabilities associated with the corresponding flows of events generated by the crossings, i.e. under conditions of the 'horizontal window' type. 05.50 LATTICE THEORY AND STATISTICS; ISING PROBLEMS

(see also 75.10H Ising models)

117094 On supermodular lattices. V.R.Chandran, V.Lakshmanan (Ramanujan Inst. of Math., Univ. of Madras, Madras, India).
Indian J. Pure & Appl. Math., vol.14, no.9, p.1128-30 (Sept. 1983).
For the equational class of supermodular lattices the authors prove that the defining regular identity can be replaced by a balanced identity. (2 refs.)

117095 Phase diagrams of random Ising models: simple and systematic successive approximations. A.Benyoussef, N.Boccara (SPSRM, CENS, Gif sur Yvette, France).
J. Phys. (France), vol.44, no.10, p.1143-7 (Oct. 1983).
The authors present a sample and systematic method to calculate phase diagrams of random Ising models. It applies to a wide class of systems in which, however, randomness has to be described by discrete random variables. They calculated, at different orders of approximation, various quantities like critical temperatures and percolation thresholds in good agreement with exact known results. (8 refs.)

117096 Ground state of one-dimensional systems and fixed points of 2*n*-dimensional map. E.Allroth (Inst. fur Festkorperforschung, Kernforschungsanlage Julich, Julich, Germany).
J. Phys. A (GB), vol.16, no.14, p.L497-501 (1 Oct. 1983).
The ground-state problem for discrete one-dimensional systems with interactions between *n*-nearest neighbours is connected with 2*n*-dimensional maps. Fixed points of these maps correspond to periodic system configurations. For a general class of systems it is explicitly shown for the first time that fixed points with some elliptic character cannot represent ground states. (4 refs.)

117097 Cumulant renormalisation group and its application to the incipient infinite cluster in percolation. D.C.Hong, H.E.Stanley (Dept. of Phys., Boston Univ., Boston, MA, USA).
J. Phys. A (GB), vol.16, no.14, p.L525-9 (1 Oct. 1983).
The authors introduce the cumulant method into the context of position-space renormalisation group. The advantage of this method over previous procedures is that one need not systematically evaluate all 2^N states of each Kadanoff cell, where N is the number of elements (sites or bonds) in the cell. They illustrate this method by calculating, for bond percolation with an eight-bond cell, the critical exponents characterizing the following quantities: (i) the mean number of backbone bonds, (ii) the mean number of bonds in the minimum and maximum paths along the backbone, (iii) the mean number of singly connected ('red') bonds, and (iv) the mean number of bonds in all the self-avoiding walks connecting the two extreme points. They derive previously obtained results of the conductivity and resistivity. (17 refs.)

117098 The exact solution of a nonplanar Ising model. R.G.Bowers (Dept. of Appl. Math., Univ. of Liverpool, Liverpool, England).
J. Phys. A (GB), vol.16, no.14, p.L531-4 (1 Oct. 1983).
A generalisation of the star-triangle transformation is used to establish a correspondence between a nonplanar Ising lattice with two interaction constants and the standard triangular Ising model. The critical point of the nonplanar lattice is obtained exactly for various values of the ratio of the interaction constants. The singularity in the zero-field free energy of the nonplanar lattice is investigated. It is shown to be of the same form as that displayed by the corresponding standard Ising model. (10 refs.)

117099 Droplet structure in Ising and Potts models. A.Coniglio (Istituto di Fisica Teorica, Napoli, Italy), R.Figari.
J. Phys. A (GB), vol.16, no.14, p.L535-40 (1 Oct. 1983).
The structure of a recently introduced droplet in the q-state Potts model is analysed. The authors derive exact relations from which it follows that the incipient infinite droplet at the critical temperature is a self-similar fractal made of links and blobs, just as recently found in random percolation. The number of links N_{links} between two points separated by a distance of the order b is given by $N_{\mathrm{links}} \propto b^{1/\nu_{\mathrm{B}}(q)}$ where $\nu_{\mathrm{B}}(q)$ is the connectedness length exponent when $T=T_c(q)$ and p_{B} is used as an independent variable. This result and the available calculations of $\nu_{\mathrm{B}}(q)$ indicate that the number of links decreases as q increases. An analysis of the structure of the usual clusters made of nearest-neighbour sites in a given Potts site configuration is also made. In particular, it shows that for $d=2$ the incipient infinite cluster is made only of blobs and no links. (31 refs.)

117100 Exact fractals with adjustable fractal and fracton dimensionalities. D.Ben-Avraham, S.Havlin (Dept. of Phys., Bar-Ilan Univ., Ramat-Gan, Israel).
J. Phys. A (GB), vol.16, no.15, p.L559-63 (21 Oct. 1983).
A family of exact fractals is presented. By adjusting two external parameters, a wide range of fractal and fracton dimensionalities can be achieved. This includes the case of fracton dimensionality of 2, which is critical for diffusion. (11 refs.)

117101 Diffusion on fractal lattices and the fractal Einstein relation. J.A.Given, B.B.Mandelbrot (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
J. Phys. A (GB), vol.16, no.15, p.L565-9 (21 Oct. 1983).
Finitely ramified fractal lattices show anomalous diffusion with $\langle \mathrm{r}^2 \rangle \propto \mathrm{t}^{2\mathrm{H}}$. There is a hierarchy of transit times which are shown by Monte Carlo simulation to satisfy $\langle \tau_{\mathrm{n}} \rangle \propto \alpha^{\mathrm{n}}$ for large n, where $\alpha=\mathrm{b}^{1/\mathrm{H}}$ and b is the base of the lattice. The lattice resistivity scales with size as $\rho \propto \mathrm{R}^{\mathrm{n}}$ where R is characteristic of the lattice. Exact renormalisation group methods yield α and R analytically and verify the Einstein relation for fractals $\alpha=\mathrm{RN}$. (12 refs.)

117102 Spiral self-avoiding walks. V.Privman (Baker Lab., Cornell Univ., Ithaca, NY, USA).
J. Phys. A (GB), vol.16, no.15, p.L571-3 (21 Oct. 1983).
Self-avoiding walks with a 'spiral' constraint, on the square lattice, are enumerated up to 40 steps. Numerical evidence suggests that they belong to a new universality class. (19 refs.)

117103 Multicritical behaviour in the q-state Potts lattice-gas. T.Temesvari (Inst. for Theoretical Phys., Eotvos Univ., Budapest, Hungary), L.Herenyi.
J. Phys. A (GB), vol.16, no.15, p.L575-82 (21 Oct. 1983).
The phase diagram of the q-state Potts lattice-gas is determined exactly on a Cayley tree for $\mathrm{q}<2$. The authors use this result to make some conjectures concerning the lower-dimensional cases. It is argued that there should be a tetracritical point, different from the transition point where Ising droplets diverge, in the case of three-dimensional correlated site-bond percolation ($\mathrm{q}=1$). In two dimensions, the critical exponent γ_{p} of the mean cluster size at the Ising critical point is derived from the extended den Nijs conjectures: $\gamma_{\mathrm{p}}={}^{91}/_{48}=1.896$. (28 refs.)

117104 On square lattice directed percolation and resistance models. J.C.Wierman (Dept. of Math. Sci., Johns Hopkins Univ., Baltimore, MD, USA).
J. Phys. A (GB), vol.16, no.15, p.3545-51 (21 Oct. 1983).
Recent papers by Dhar et al. (1981) and Dhar (1982) showed that the standard directed percolation model, with blocked or one-way bonds, is dual to a percolation model with one-way or two-way bonds. This duality is exploited to improve lower bounds for the critical probability of the directed bond percolation model on the square lattice by considering k-order backflows. Two intuitive claims made in the papers mentioned above are verified by the author. Wedge angles of the directed percolation model and the dual model exist almost surely and sum to π. As the order of backflows $\mathrm{k} \to \infty$, the limit of the Dhar-Barma-Phani bounds is the correct critical probability. The proofs use techniques from the theories of subadditive processes and first passage percolation. (7 refs.)

117105 Directd percolation: series expansion for some three-dimensional lattices. K.De'Bell (Dept. of Phys., Dalhousie Univ., Halifax, Nova Scotia, Canada), J.W.Essam.
J. Phys. A (GB), vol.16, no.15, p.3553-60 (21 Oct. 1983).
Low density series expansions have been obtained for the directed cubic lattice bond problem and the directed cubic and body centred cubic lattice site problems. Estimates of the critical probabilities and critical exponents γ, γ_0, $\nu\|$, $\nu_\perp$ for these problems are obtained. The exponent values are found to be consistent with the universality of directed percolation and Reggeon field theory and the hyperscaling relation $\beta=(\mathrm{D}\nu_\perp+\nu\|\text{-}\gamma)/2$. (12 refs.)

117106 Renormalisation group for percolation using correlation parameters. G.F.Tuthill (Dept. of Phys., Montana State Univ., Bozeman, MT, USA), W.Klein.
J. Phys. A (GB), vol.16, no.15, p.3561-70 (21 Oct. 1983).
The authors have applied position-space RG methods to the problem of percolation of correlated sites on the square and simple cubic lattices. The approach uses a cell-to-site transformation and superposition approximation to renormalise the site probabilities and a set of correlation parameters. In two dimensions they find two non-trivial fixed points, for random percolation and Ising-correlated percolation respectively. In three dimensions only a single non-trivial physically accessible fixed point is found, controlling the percolation of random sites. In contrast to the two-dimensional case a fixed point for positive values of correlation is found to have complex eigenvalues, and does not correspond to a physical percolation point. The finding of a single universality class for correlated percolation in three dimensions is in agreement with the known behaviour of Ising-correlated percolation. (19 refs.)

117107 2D pure and dilute quantum transverse Ising model. G.Kamieniarz (Inst. of Phys., A Mickiewicz Univ., Poznan, Poland).
J. Phys. C (GB), vol.16, no.28, p.L1021-24 (10 Oct. 1983).
The quantum critical behaviour of the transverse Ising model on a planar lattice at zero temperature is shown, within approximate block renormalisation-group transformations, to be unaffected by the bond dilution. The critical exponents and the critical fields are calculated for both pure and dilute systems. (25 refs.)

117108 Critical behavior of a three-dimensional dimer model. S.M.Bhattacharjee, J.F.Nagle (Dept. of Phys., Carnegie-Mellon Univ., Pittsburgh, PA, USA), D.A.Huse, M.E.Fisher.
J. Stat. Phys. (USA), vol.32, no.2, p.361-74 (Aug. 1983).
The phase transition behavior of a dimer model on a three-dimensional lattice is studied. This model is of biological interest because of its relevance to the lipid bilayer main phase transition. The model has the same kind of inactive low-temperature behavior as the exactly solvable Kasteleyn dimer model on a two-dimensional honeycomb lattice. Because of low-temperature inactivity, determination of the lowest-lying excited states allows one to locate the critical temperature. The second-lowest-lying excited states are studied and exact asymptotic results are obtained in the limit of large lattices. These results together with a finite-size scaling ansatz suggest a logarithmic divergence of the specific heat above T_c for the three-dimensional model. Use of the same ansatz recovers the exact divergence ($\alpha=1/2$) for the two-dimensional model. (15 refs.)

117109 Phase diagram of a spin-1 quantum Ising model with dipole and quadrupole interactions. C.Buzano (Dipartimento di Fisica del Politecnico, Torino, Italy), M.Rasetti, P.T.Valabrega.
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.257-74 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
A quantum Ising-like spin-1 system with both dipole and quadrupole interactions is analyzed. Such model is a generalized quantum version of the Blume-Emery-Griffiths model (1971) in an external anisotropic field. Models of this type are interesting candidates to describe phase transitions in liquid crystals. The phase diagram as well as the thermodynamic potentials of the model are constructed by a recently formulated improved version of mean field theory. The latter, which has the usual mean field theory as its zero-th order approximation, takes into account fluctuations up to the fourth-order. The phase diagram is found to exhibit phase transition manifolds of both the first and the second order, as well as multicritical lines. Four phases can be recognised: one ferromagnetic and three paramagnetic. The phases are identified by the requirements of minimum free energy constrained by the condition of self consistency of the order parameters ρ and q. (10 refs.)

117110 Scaling of kinetically growing clusters. M.Kolb, R.Botet, R.Jullien (Lab. de Phys. des Solides, Univ. Paris-Sud, Orsay, France).
Phys. Rev. Lett. (USA), vol.51, no.13, p.1123-6 (26 Sept. 1983).
A model describing the process of cluster growth by aggregation of clusters is introduced and investigated with the Monte Carlo method. It is found that the clusters are scale invariant. The fractal dimension of this new class of kinetic critical behavior is $D=\nu^{-1}=1.38\pm0.06$ in $d=2$ dimensions as determined by the radii of gyration and the density correlations of the aggregates. The process is compared with other types of kinetic and equilibrium critical phenomena. (23 refs.)

117111 Competing criticality of short- and infinite-range interactions on the Cayley tree. M.Kardar, M.Kaufman (Dept. of Phys., MIT, Cambridge, MA, USA).
Phys. Rev. Lett. (USA), vol.51, no.13, p.1210-13 (26 Sept. 1983).
The Ising model, with equivalent-neighbor and nearest-neighbor interactions of Cayley-tree connectivity, is solved exactly. Breaking translational symmetry by turning on the Cayley interactions is analogous to lowering spatial dimensionality in Bravais lattices. A range of classical criticality, a point of logarithmic corrections, a range of continuously varying power-law singularities, and a point of exponential singularity are successively encountered. (21 refs.)

117112 Monte Carlo study of scale-covariant field theories. A.T.Ogielski (Bell Labs., Murray Hill, NJ, USA).
Phys. Rev. D (USA), vol.28, no.6, p.1461-72 (15 Sept. 1983).
The author investigates the continuum limit of Klauder's field-theory models defined on a hypercubic lattice in four dimensions by mapping this problem onto a statistical-mechanical problem of an analog spin system, with partition function $Z=\int_{-\infty}^{\infty}\Pi_{\mathrm{x}}(dS_{\mathrm{x}}/|S|^{\mathrm{B}})\exp(-A\Sigma_{\mathrm{x}}S_{\mathrm{x}}{}^2-u_0\Sigma_{\mathrm{x}}S_{\mathrm{x}}{}^4+K\times\Sigma_{\mathrm{x},\mu}S_{\mathrm{x}}S_{\mathrm{x}+\mu}\quad)$ and A a given function of u_0 and B determined from an appropriate normalization of transitions in the regime $0\leq B<1$, and in particular the behavior of the renormalized coupling constant g_{R}. For $B>0$ the authors find a line of first-order transitions for small u_0, while for larger values of u_0 there is a line of second-order transitions very similar to the Ising-type transitions of the usual ($B=0$) theory, and characterized by vanishing of the renormalized coupling g_{R}. Only in the latter case can the continuum field theory be defined, and it appears to be trivial free field theory for any choice of the parameter B. (17 refs.)

117113 Elementary excitations of the quantum sine-Gordon model in the massless regime $\beta^2>8\pi$: derivation from the *XXZ* model. F.D.M.Haldane (Dept. of Phys., Univ. of Southern California, Los Angeles, CA, USA).
Phys. Rev. B (USA), vol.28, no.5, p.2505-8 (1 Sept. 1983).
From the identification of the easy-plane *XXZ* spin chain as a $\beta^2>8\pi$ quantum sine-Gordon system, the nonlinear elementary excitations of the latter are identified as massless 'twists' carrying the topological charge $\pm\beta^2/8\pi$, and (depending on β^2) twist-antitwist bound states. (16 refs.)

117114 Field-theoretic approach to biconnectedness in percolating systems. A.B.Harris (Schlumberger-Doll Res., Ridgefield, CT, USA).
Phys. Rev. B (USA), vol.28, no.5, p.2614-29 (1 Sept. 1983).
A general method is given whereby m-connectedness correlation functions can be studied in the percolation problem. The method for $m=1$ involves calculating the kth power of the correlation function $\langle\sigma(x)\sigma(x')\rangle$ for a randomly dilute Ising model at nonzero temperature and subsequently averaging over configurations. The final step is to take the limit $k \to 0$. This method is tested by reproducing the standard results for the percolation problem from an extension of the calculation of Stephen and Crest. For $m>1$ an additional 'color' index is introduced and a Hamiltonian is constructed in which different colors repel one another, thereby giving an exact prescription for m-connectedness. Order parameters for m-connectedness are identified. The $m=2$ order parameter couples through a trilinear term to the $m=1$ order parameter. The main result is that $\beta^{(\mathrm{m})}$ the exponent for m-connectedness is given by $\beta^{(\mathrm{m})}=m\beta+\nu\psi^{(\mathrm{m})}$, where β and ν are the usual exponents for percolation and $\psi^{(\mathrm{m})}$ is a new crossover exponent which, to lowest order in $\varepsilon=6-d$, is given by $\psi^{(\mathrm{m})}=m(m-1)\varepsilon^2/49$. This result implies that the fractal dimensionality of the biconnected part of the critically percolating cluster is given in terms of the percolation critical exponents as $\gamma/\nu-\psi^{(2)}$. If 'nodes' are defined as triconnected points, then $\beta^{(3)}$ is the critical exponent associated with their density in the infinite cluster. The author also discusses evidence that the 'node-link' model of Skal-Shklovskii-de Gennes breaks down for d less than some critical value $\hat{d}$. Numerically he adduces evidence that $\hat{d}$ may be larger than 3. (81 refs.)

117115 Finite-size-scaling study of a two-dimensional lattice-gas model with a tricritical point. P.A.Rikvold, W.Kinzel, J.D.Gunton, K.Kaski (Inst. fur Festkorperforschung, KFA Julich GmbH, Julich, Germany).
Phys. Rev. B (USA), vol.28, no.5, p.2686-92 (1 Sept. 1983).
The authors present a finite-size-scaling study of a two-dimensional square-lattice-gas model with nearest-neighbor repulsion and next-nearest-neighbor attraction. This system may be used as a simplified model of adsorbates on transition-metal (100) surfaces. An accurate determination of the tricritical temperature is obtained by the utilization of the degeneracy of the three largest eigenvalues of the transfer matrix at a critical point. They obtain the phase diagram and critical and tricritical exponents, all quite consistent with previously known results. They also find that a recent conjecture relating the

critical exponent η to the correlation-length amplitude seems to work well even at the tricritical point. (25 refs.)

117116 Renormaization-group study of the Hamiltonian version of the Potts model. II. Self-dual renormalization-group treatment. F.Igloi, M.Solyom (Central Res. Inst. for Phys., Budapest, Hungary).
Phys. Rev. B (USA), vol.28, no.5, p.2785-91 (1 Sept. 1983).
The one-dimensional Hamiltonian version of the two-dimensional Potts model is studied by the application of a self-dual renormalization-group transformation. Blocks containing up to 11 sites are considered and mapped into new, equivalent Potts spins by keeping the lowest-lying levels only. The higher-lying states are also taken into account in a perturbational wave for smaller cells. Unfortunately, this renormalization-group treatment cannot reproduce the first-order transition for large values of the number of states, and the critical exponents for the three-and four-state Potts model do not seem to converge to the conjectured results as larger and larger blocks are taken. (14 refs.)

117117 Solutions to the Schrodinger equation on some fractal lattices. E.Domany (Dept. of Electronics, Weizmann Inst. of Sci., Rehovot, Israel), S.Alexander, D.Bensimon, L.P.Kadanoff.
Phys. Rev. B (USA), vol.28, no.6, p.3110-23 (15 Sept. 1983).
The Schrodinger equation is solved on a variety of fractal lattices using a recursive technique. In this method, the energy levels and wave functions on a lattice with N_n sites are calculated in terms of the corresponding quantities on a smaller lattice with N_{n-1} sites, via a kind of decimation process. As $n \to \infty$ the resulting energy levels are discrete, very closely spaced, and highly degenerate. Smoothed densities of states have a wide variety of singularities. (9 refs.)

117118 Long-range correlations in Bethe lattices. F.Yndurain, R.Barrio (Dept. de Fisica Fundamental, Univ. Autonoma de Madrid, Madrid, Spain), R.J.Elliott, M.F.Thorpe.
Phys. Rev. B (USA), vol.28, no.6, p.3576-8 (15 Sept. 1983).
The authors show that the long-range correlations in Bethe lattices contain pathological features that cause great difficulties when calculating physical properties that depend on them. (11 refs.)

05.60 TRANSPORT PROCESSES: THEORY

117119 The differential equations for the processes of statistical kinematics in solids. A.Sobaszek (Inst. of Phys., Warsaw Tech. Univ., Warsaw, Poland).
Acta Phys. Pol. A (Poland), vol.A64, no.3, p.295-307 (Sept. 1983).
The differential equations for the processes of statistical kinematics are obtained for the case of discrete free paths and time statistical distributions. The results may be especially useful in the following cases: (1) when the distribution of concentration contains high-order harmonics (i.e. for short diffusion times or for thin layers), (2) when atoms migrate in a field of driving forces, (3) when central moments of statistical distributions of lengths of jumps and of their frequencies differ from zero. The possibility of generating waves of concentration is pointed out. Applications to neutron transport theory are also possible. (8 refs.)

117120 Derivative estimates for eigenfunctions with accessible boundaries and application to diffusions. M.V.Day (Dept. of Math., Virginia Polytech. Inst., Blacksburg, VA, USA).
Appl. Anal. (GB), vol.16, no.4, p.329-44 (1983).
The author considers an eigenvalue problem on a bounded interval and establishes some uniform bounds on the first derivatives of the L^2-normalized eigenfunctions in terms of the eigenvalues. Such bounds are established for singular boundaries of regular type and most cases of exit type, according to Feller's boundary classification. Implications of such bounds for diffusion semigroups are discussed and an application is made to a property of conditional diffusions. (8 refs.)

117121 Thermogenesis: inverse filters. E.Cesari, J.Vinals (Dept. de Termologia, Facultat de Fisica, Barcelona, Spain), J.Ortin, V.Torra.
An. Fis. Ser. B (Spain), vol.79, no.2, p.128-33 (May-Aug. 1983). [received: Oct. 1983]
The obtaining of the thermogenesis through inverse filtration ideally requires the correction of the whole transfer function (TF) of the system; that is, the elimination of the whole series of poles and zeros. Present methods of identifying the first poles and zeros of the calorimeter are briefly discussed, together with the limitations which arise as a consequence of experimental noise. Moreover, the comparison between the frequency representation of the filter and the experimental spectrum of the device obtained through harmonic analysis allows an estimate of the deconvolutive performance of the device obtained through harmonic analysis allows an estimate of the technique and an interpretation of the delays and overcorrections appearing in the thermogene is given by the filter. (6 refs.)

117122 Numerical-analytical algorithm for solving transfer equations for a plane layer. V.I.Bilenko.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.9, p.65-9 (1983). In Ukrainian.
A simple numerical-analytical algorithm is given to solve the boundary-value problem for the linear integro-differential equation of radiation transfer in a plane layer. Conditions of the approximate operator equation, solvability algorithm error estimations and computation results of the numerical example are available. (12 refs.)

117123 Time-reversal noninvariance of generalized quantum mechanical Boltzmann kinetic equation derived by Keldysh. Z.A.Nikolic-Mojse (Pedagogical-Tech. Faculty, Zrenjanin, Yugoslavia).
Fizika (Yugoslavia), vol.15, no.3, p.255-61 (July-Sept. 1983).
Considering the time-reversed system and using diagram techniques for anticausal Green function it was shown that the origin of time-reversal noninvariance (of generalized quantum-mechanical Boltzmann kinetic equation) derived by Keldysh (1965) stems from the selection of the boundary condition that the perturbed system was in the thermodynamical equilibrium at the moment $t = -\infty$. (5 refs.)

117124 Diffusion constant of a quantum particle moving in tight-binding media modulated by non-white noises. Y.Inaba (Dept. of Phys., Univ. of Tokyo, Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3144-53 (Sept. 1983).
Diffusion of a particle or an excitation in randomly fluctuating media is studied theoretically. The model is a tight-binding Hamiltonian whose diagonal or off-diagonal elements are modulated by mutually-independent random noises. The non-white modulation models are investigated precisely. The diffusion constant (D) depends on the noise-parameters such as the amplitude (Δ) and the correlation time (γ^{-1}) and also depends on the static band width (W). Explicit calculation of D has been performed by using the dynamical coherent potential approximation and by computer experiments. In the case that diagonal elements are modulated by discrete-jump noises, D as a function of γ has a minimum in the vicinity of $\hbar\gamma = \Delta \gg W$. On the contrary, $D(\gamma)$ is a monotonically-increasing function of γ if $\Delta \ll W$. In the off-diagonal fluctuation case, the diffusion constant exhibits a feature qualitatively different from the diagonal fluctuation model. (13 refs.)

117125 On the spherical harmonics and discrete ordinates methods for azimuth-dependent intensity calculations. A.H.Karp (IBM Sci. Center, Palo Alto, CA, USA), S.Petrack.
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.30, no.4, p.351-6 (Oct. 1983).
It is known that the azimuth-averaged component of the intensity computed from the spherical harmonics method for solving the equation of radiative transfer is 'exact' at the Gauss quadrature points. The authors show that a similar relation holds for higher terms in the Fourier expansion of the intensity but that the results are 'exact' at the zeros of the associated Legendre polynomials. The relationship between the discrete ordinates and spherical harmonics methods follows from this discussion. A discrete ordinates quadrature scheme, based on the zeros of the associated Legendre polynomials, is shown to maintain the correspondence of the methods for these problems, as well as providing a better set of points than other methods in use. (15 refs.)

117126 Tagged particle fluctuations in uniform shear flow. M.C.Marchetti, J.W.Dufty (Inst. for Phys. Sci. & Technol., Univ. of Maryland, College Park, MD, USA).
J. Stat. Phys. (USA), vol.32, no.2, p.255-77 (Aug. 1983).
The nonlinear Boltzmann and Boltzmann-Lorentz equations are used to describe the dynamics of a tagged particle in a nonequilibrium gas. For the special case of Maxwell molecules with uniform shear flow, an exact set of equations for the average position and velocity, and their fluctuations, is obtained. The results apply for arbitrary magnitude of the shear rate and include the effects of viscous heating. A generalization of Onsager's assumption of the regression of fluctuations is found to apply for the relationship between the equations for the average dynamics and those for the time correlation functions. The connection between fluctuations and dissipation is described by the equations for the equal-time correlation function. The source term in these equations indicates that the 'noise' in this nonequilibrium state is qualitatively different from that in equilibrium, or even local equilibrium. These equations are solved to determine the velocity autocorrelation function as a function of the shear rate. (17 refs.)

117127 Fokker-Planck and Langevin descriptions of fluctuations in uniform shear flow. R.F.Rodriguez (Thermophys. Div., NBS, Washington, DC, USA), E.Salinas-Rodriguez, J.W.Dufty.
J. Stat. Phys. (USA), vol.32, no.2, p.279-98 (Aug. 1983).
The Boltzmann description for tagged particle fluctuations in a nonequilibrium gas (Marchetti and Dufty, 1983) is further analyzed in the limit of small mass ratio between the gas and the tagged particles. For a large class of nonequilibrium states the Boltzmann-Lorentz collision operator for the tagged particle distribution is expanded to leading order in the mass ratio, resulting in a Fokker-Planck operator. The drift vector and diffusion tensor are calculated exactly for Maxwell molecules. The Fokker-Planck operator depends on the nonequilibrium state only through the hydrodynamic variables for the fluid. The diffusion tensor is a measure of the 'noise' amplitude and is not simply determined from the nonequilibrium temperature; instead, it depends on the fluid stress tensor components as well. For the special case of uniform shear flow, the Fokker-Planck equation is of the linear type and may be solved exactly. The associated set of Langevin equations is also identified and used to describe spatial diffusion in the Lagrangian coordinates of the fluid. The effect of viscous heating on diffusion is discussed and the dependence of the diffusion coefficient on the shear rate is calculated. (11 refs.)

117128 Material transport in hyperfiltration. H.Vink (Inst. of Phys. Chem., Univ. of Uppsala, Uppsala, Sweden).
J. Chem. Soc. Faraday Trans. I (GB), vol.79, pt.10, p.2359-65 (Oct. 1983).
Transport equations for hyperfiltration, based on the frictional formalism of non-equilibrium thermodynamics, are derived for a gel-type membrane. Taking the concentration distribution in the membrane into account and allowing for possible non-equilibrium partition effects at the membrane boundaries, the flow equations are integrated and equations for solute rejection in dilute solutions are derived. The main parameters determining solute rejection are the solute partition coefficient on the high-pressure side of the membrane and a frictional factor, involving the solute and solvent friction coefficients. Partition effects on the low-pressure side are unimportant for processes at high flow rates. (17 refs.)

117129 Theory of the passage of particles and waves through randomly inhomogeneous media. I.M.Lifshitz (S.I. Vavilov Inst. of Phys. Problems., Acad. of Sci., Moscow, USSR), S.A.Gredeskul, L.A.Pastur.
Sov. Phys.-JETP (USA), vol.56, no.6, p.1370-8 (Dec. 1982). Translation of: *Zh. Eksp. & Teor. Fiz. (USSR)*, vol.83, no.6, p.2362-76 (Dec. 1982). [received: Oct. 1983]
A study is made of the statistical properties of the transparency of a disordered layer. The asymptotic behavior of the transparency of a thick layer is investigated in quasi-one-dimensional and three-dimensional cases: in particular, a formula is obtained for the relationship between the self-averaging decrement of the transparency and the asymptotic value of the transparency probability density of separate filaments forming a quasi-one-dimensional layer. Expansions of the decrement are obtained in powers of the density of scatterers for different positions of the incident particle energy relative to the spectrum of an infinite disordered system. 05.70 THERMODYNAMICS

(see also 44.60 Thermodynamic processes, 64. Equations of state, phase equilibria and phase transitions, 65. Thermal properties of condensed matter; for chemical thermodynamics, see 82.60)

117130 Optimal control of thermodynamic processes. II. L.I.Rozonoer, A.M.Tsirlin.
Autom. & Remote Control (USA), vol.44, no.2, pt.2, p.209-20 (Feb. 1983). Translation of: *Avtom. & Telemekh. (USSR)*, vol.44, no.2, p.88-101 (Feb. 1983). [received: Oct. 1983]
For pt.I see Avtomatika i Telemekhanika, vol.44, no.1, p.70 (1983) or Automation and Remote Control, vol.44, no.1, p.55 (1983). Maximization of the work in a nonequilibrium system in fixed time is considered. The well-known thermodynamic results concerning the maximum work constitute a limiting case when the process time tends to infinity. (3 refs.)

117131 Kinetic mean field theories: Results of energy constraint in maximizing entropy. G.Stell (Depts. of Mech. Engng. & Chem., State Univ. of New York, Stony Brook, NY, USA), J.Karkheck, H.van Beijeren.
J. Chem. Phys. (USA), vol.79, no.6, p.3166-7 (15 Sept. 1983).
In a previous article (ibid., vol.75, p.1475, 1981), two of the authors defined and discussed a family of kinetic mean-field theories (KMFT) of transport relevant to simple dense fluids modeled by a system of particles interacting via a pair potential $\phi(r_{12})$ with hard-sphere core $\phi^{HS}(r_{12})$ and an arbitrary soft tail $\phi_t(r_{12})$. They quantitatively assessed a pair of these theories—a kinetic variational theory (KVT) derived from maximizing the entropy with certain simple constraints (a key constraint being core impenetrability), and an immediate extension, the kinetic reference theory (KRT) in which the velocity-correlated collisional effects ignored in the KVT are approximated by those of a hard-sphere reference system at the same local number density $n(r,t)$. The authors have continued their study in this area. (8 refs.)

117132 Continuum fluids with a discontinuity in the pressure. G.W.Milton, M.E.Fisher (Baker Lab., Cornell Univ., Ithaca, NY, USA).
J. Stat. Phys. (USA), vol.32, no.2, p.413-38 (Aug. 1983).
A class of one-dimensional continuum fluid models is defined in which classical particles interact through translationally-invariant strongly-tempered many-body potentials meeting conditions sufficient to ensure a proper thermodynamic limit. However, an exact analysis demonstrates that for certain ranges of parameter values the pressure versus density isotherms are discontinuous. The basic models also entail discontinuous temperature versus configurational entropy isobars but extended models are described which exhibit either type of anomaly alone and various unobserved but thermodynamically allowed, anomalous types of first-order transitions. (18 refs.)

117133 Viscous effects in the frictional formalism of non-equilibrium thermodynamics. H.Vink (Inst. of Phys. Chem., Univ. of Uppsala, Uppsala, Sweden).
J. Chem. Soc. Faraday Trans. I (GB), vol.79, pt.10, p.2355-8 (Oct. 1983).
A hydrodynamic interpretation of the frictional formalism of non-equilibrium thermodynamics indicates that viscous effects are inherent in the formalism, provided the component velocities are properly averaged. Under these circumstances transport processes in porous media can be treated without reference to the structure of the medium. The treatment can be applied to open pore structures as well as to dense gels, and takes into account both diffusive transport and viscous flow phenomena. (10 refs.)

117134 Generalized local balance concepts in non-equilibrium thermodynamic field theory. R.T.Balmer (Dept. of Mech. Engng., Univ. of Wisconsin, Milwaukee, WI, USA).
J. Non-Equilibrium Thermodyn. (Germany), vol.8, no.1, p.19-28 (1983).
A reorganized development of the local rate balance equation is shown to produce generalized expressions for the local fluxes and production rates of intensive thermodynamic properties. These expressions are composed of terms associated with each variable upon which the intensive property is assumed to depend. When these results are applied to entropy it is shown that the specific entropy production rate is composed of more than just the product of generalized forces and generalized fluxes. Terms originating from the generation (i.e. production or destruction) of the independent variables in the specific entropy function also appear in its production rate. (8 refs.)

117135 Balance equation of open multicomponent systems. I. Mass and momentum balance. W.H.Muller, W.Muschik (Tech. Univ. Berlin, Berlin, Germany).
J. Non-Equilibrium Thermodyn. (Germany), vol.8, no.1, p.29-45 (1983). In German.
Starting from the global balance equations of mass, momentum, energy and entropy for discrete open systems relations between quantities of the mixture and those of the components of the mixture are derived. All dynamical non-equilibrium quantities such as stress tensor, temperature, chemical potential and entropy are defined as contact quantities between discrete systems. The connexion between this approach and the usual local balance equations is discussed. (7 refs.)

117136 Balance equation of open multicomponent systems. II. Energy and entropy balance. W.Muschik, W.H.Muller (Tech. Univ. Berlin, Berlin, Germany).
J. Non-Equilibrium Thermodyn. (Germany), vol.8, no.1, p.47-66 (1983).
For pt.I see ibid., vol.8, p.29 (1983). Starting from the global balance equations of mass, momentum, energy and entropy for discrete open systems relations between quantities of the mixture and those of the components of the mixture are derived. All dynamical non-equilibrium quantities such as stress tensor, temperature, chemical potential and entropy are defined as contact quantities between discrete systems. The connexion between this approach and the usual local balance equations is discussed. (21 refs.)

117137 Quantum sine-Gordon thermodynamics. X.Zotos (Phys. Dept., Univ. of Southern California, Los Angeles, CA, USA).
J. Phys. Colloq. (France), vol.44, no.C-3, p.477-80 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Using the Bethe ansatz method the author analyzes the thermodynamics of the quantum sine-Gordon model. He presents a finite set of coupled nonlinear integral equations for the thermodynamic equilibrium densities of the various excitations, which he solves numerically. He calculates the specific heat and compares his results with recent experiments of CsNiF$_3$ and TMMC. The good accord obtained indicates the importance of quantum effects. (9 refs.)

117138 Geometrical approach to moving-interface dynamics. R.C.Brower (Lyman Lab. of Phys., Harvard Univ., Cambridge, MA, USA), D.A.Kessler, J.Koplik, H.Levine.
Phys. Rev. Lett. (USA), vol.51, no.13, p.1111-14 (26 Sept. 1983).
A general class of models is introduced which relate the motion of a phase boundary to properties of the local interfacial geometry. These systems can undergo successive destabilizations as they grow, possibly giving rise to nonequilibrium spatial patterns. This normalism has applications to a wide variety of physical problems, especially including dendritic solidification. (16 refs.)

117139 Thermodynamic length and dissipated availability. P.Salamon (Dept. of Math. Sci., San Diego State Univ., San Diego, CA, USA), R.S.Berry.
Phys. Rev. Lett. (USA), vol.51, no.13, p.1127-30 (26 Sept. 1983).
New expressions for the availability dissipated in a finite-time endoreversible process are found by use of Weinhold's (1976) metric on equilibrium states of a thermodynamic system. In particular, the dissipated availability is given by the square of the length of the corresponding curve, times a mean relaxation time, divided by the total time of the process. The results extend to local thermodynamic equilibrium if instead of length one uses distance (length of the shortest curve) between initial and final states. (13 refs.)

117140 Pinning transition of the discrete sine-Gordon equation. S.N.Coppersmith, D.S.Fischer (Bell Labs., Murray Hill, NJ, USA).
Phys. Rev. B (USA), vol.28, no.5, p.2566-81 (1 Sept. 1983).
The ground state of the discrete sine-Gordon equation, used to model a one-dimensional solid in a periodic potential is examined in the incommensurate region. The behaviour of the system near the transition from an unpinned to a pinned phase (first discussed by Aubry) is investigated. A disorder parameter and a correlation length are defined and shown numerically to obey scaling relations on both sides of the transition. The system studied is equivalent to the 'standard map' of dynamical systems theory, and this relationship is discussed. In particular, the authors' results extend the scaling behaviour found by Shenker and Kadanoff into the 'chaotic' regime. (25 refs.)

117141 Mechanism of symmetry breaking in the spherical limit: phase coherence in finite-size systems. F.de Pasquale, Z.Racz, P.Tartaglia (Istutito di Fisica, Univ. degli Studi di Roma, Roma, Italy).
Phys. Rev. B (USA), vol.28, no.5, p.2582-7 (1 Sept. 1983).
The appearance of symmetry breaking in the thermodynamic limit is studied from a dynamical point of view. The authors solved the time-dependent Landau-Ginzburg model in the spherical limit and show that the finite-size develops a phase-coherence phenomenon analogous to that appearing in lasers. Below the critical point of the infinite system the orientational diffusion of the magnetization becomes the slowest mode and its time scale is well separated from all the other relaxational mechanisms. As expected, this phase diffusion freezes in completely in the thermodynamic limit. (15 refs.)

06.00 MEASUREMENT SCIENCE, GENERAL LABORATORY TECHNIQUES, AND INSTRUMENTATION SYSTEMS

06.20 METROLOGY

06.20D Measurement and error theory

117142 Statistical errors for non-linear system measurements involving square-law operations. J.S.Bendat (J.S. Bendat Co., Los Angeles, CA, USA).
J. Sound & Vib. (GB), vol.90, no.2, p.275-82 (22 Sept. 1983).
Develops normalized random error formulas for special bispectra estimates and associated frequency response function estimates in finite memory square-law systems. Error formulas are also derived for output spectrum estimates from these non-linear systems and for associated non-linear coherence functions. These formulas are useful to evaluate such measured non-linear results as well as to design experimental programs. (3 refs.)

117143 Directions of building the structure of metrology. R.A.Krajewski (Politech. Gdanskiej, Gdansk, Poland).
Pomiary Autom. Kontrola (Poland), vol.29, no.4, p.115-16 (April 1983). In Polish. [received: Sept. 1983]
Laying emphasis on the significance of the need of a precise description of measuring procedures, the author presents a method for suitably arranging the empirical knowledge of measurements, based on a system theory method and using decomposition methods. (19 refs.)

117144 Signal optimization for space-time-variant measuring problems. M.Peschel, M.Zecha, A.Moltmann (Akad. der Wissenschaften, Berlin, Germany).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.125-34 vol.3
Describes an impulse method for the evaluation of system functions in space-time-variant measuring processes. On the base of the properties of this computed system functions a new method is developed for processing of impulse responses or parts of them. This processing principle, which is due to the homomorphic filtering theory, permits an adaptive procedure to optimize the output of measuring channels under real conditions. (4 refs.)

117145 Basis for application of the Campbell-method for stochastic signals. M.Kreiner, H.Weiss (Inst. of Electrical Measurement Technol., Tech. Univ. of Graz, Graz, Austria).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.207-16 vol.3
Describes the investigations to obtain knowledge about the applicability of the Campbell-method for stochastic signal measurements. Experiments are described, to prove the linearity of several relations stated by Ronald M. Lichtenstein (1959) for nuclear radiation measurements. It was found out that the linear relationship does not exist in all predicted cases. It is shown that the basis for application of the Campbell-method are special random processes like Poisson or Gaussian Process. (5 refs.)

117146 Effective utilization of analytical instrument on measurement system—transitional measurement of amplitude probability density distribution for random fluctuation by pulse height analyzer and its application. K.Kariya (Dept. of Electricity, Ritsumeikan Univ., Kyoto, Japan).
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.743-50
The system construction for transitional measurement of amplitude probability density distribution (TM of APDD) and its application to the electric contacts measurement and the meteorological measurement are dealt with. These studies were carried out as the effective utilization of analytical instruments in the problems of systematization measurement. The system construction of TM of APDD using pulse height analyzer (PHA) is shown as a system which contributes to the problem of the prediction, the estimation and the filtering on the time series analysis. 06.30C Spatial variables measurement

(inc. measurement of all variables extending in space e.g. diameter, height, thickness, displacement, surface topography, particle size, area of disperse systems)

117147 Electro-optic surface profiler. J.W.Buechele, N.B.Seebe (IBM Corp., Armonk, NY, USA).
IBM Tech. Disclosure Bull. (USA), vol.26, no.3B, p.1528-30 (Aug. 1983).
An electro-optic surface profiler for multilayer ceramic greensheet inspection is arranged to provide rapid, noncontact precision measurement of depth simultaneously with surface coordinate distances, including detecting contrasting detail or structure, its geographic location and extent. (no refs.)

117148 Characterization of backside roughness of silicon wafers by mid-IR spectrometry. K.H.Kelleher, M.V.Kulkarni (IBM Corp., Armonk, NY, USA).
IBM Tech. Disclosure Bull. (USA), vol.26, no.3B, p.1597-9 (Aug. 1983).
The roughness of silicon wafer surfaces can be accurately characterized from the mid-infrared spectrum by determining the slope of a baseline arbitrarily defined through points having nearly no absorption (1046 and 700 cm^{-1} in this case) and off-set of a similar point (1107 cm^{-1}) from its location in the spectrum of a sample with polished surfaces. (no refs.)

117149 Precision displacement measurement using a diffraction grating. S.Moriyama, T.Harada.
J. Jpn. Soc. Precis. Eng. (Japan), vol.49, no.6, p.784-8 (June 1983). In Japanese.
A new precision displacement measuring method using a diffraction grating was investigated. In this paper, the measuring principle and the experimental results are described. The measuring principle is based on an interference phenomenon. Interference fringes are produced by superposing of a pair of positive and negative order diffraction beams obtained by illuminating the grating perpendicularly with a monochromatic light beam. The displacement of the grating causes sinusoidal change in brightness of the fringes. The displacement measurement is carried out by counting the fringes photoelectronically. Experimental system was constructed by using a reflection grating with the period of 1.43 μm and a laser diode as the monochromatic light source. The measuring performance with the precision of 0.1 μm over the range of 20 mm was confirmed in the experiment. An application to two-dimensional displacement measurement is also proposed. (6 refs.)

117150 Differential thickness measurement using a polarization interferometer. V.T.Chitnis, Y.Uchida (Dept. of Electric Engng., Faculty of Engng., Nagoya Univ., Nagoya, Japan), K.Matsuura, S.Hattori.
Opt. & Laser Technol. (GB), vol.15, no.5, p.269-73 (Oct. 1983).
A method for measuring the differential thickness of a thin film using a polarization interferometer is described. Theoretical estimation shows that the measurement error is less than 0.1%. Experiments performed on a PZT sample indicate high sensitivity and excellent linearity of the system. PZT expansions ranging from 300 nm to less than 1 nm could be measured with a precision better than 0.1 nm. (8 refs.)

117151 Determination of the amplitude-frequency characteristics of a profilometer with the aid of a Michelson interferometer. C.Lukianowicz (Inst. Budowy Maszyn, Wyzszej Szkoly Inzynierskiej, Koszalin, Poland).
Pomiary Autom. Kontrola (Poland), vol.29, no.4, p.121-2 (April 1983). In Polish. [received: Sept. 1983]
The author describes a method of determining the amplitude-frequency characteristics by means of a Michelson interferometer. In the research work the stroboscopic interference method was employed. Results of examining the above mentioned characteristic of a profilometer ME-10 are detailed. (4 refs.)

117152 Spherical surface roughness measurement by means of a displacement-sensitive element. J.Siuta, H.Chojnacki, M.Rojszczak (Zaklady Mech. Gorzow, Gorzow, Poland).
Pomiary Autom. Kontrola (Poland), vol.29, no.6, p.204-5 (June 1983). In Polish.
Roughness measurements on spherical surfaces are difficult, especially when the curvature radius is small, because the profilographometers commonly used in Poland serve mainly for measurements on plane surfaces. This article presents a method of roughness measurements on spherical surfaces using a displacement-sensitive element. (6 refs.)

117153 Interlaboratory study on linewidth measurements for antireflective chromium photomasks. J.M.Jerke, M.C.Croarkin, R.N.Varner.
Report NBS-SP-400-74, Nat. Bur. Stand., Washington, DC, USA (Nov. 1982), vii+183 pp.
Optical microscopes fitted with a micrometer attachment are commonly used to measure small linewidths and other critical dimensions on integrated-circuit (IC) photomasks. The authors discuss the results of an interlaboratory study to evaluate a National Bureau of Standards (NBS) prototype calibration standard for linewidth measurements on IC photomasks and procedures for adjusting and calibrating optical-microscope systems in the 0.5- to 12-μm measurement range. Using procedures furnished by NBS, industrial participants measured line spacings and linewidths on NBS antireflective-chromium artifacts. A comparison of NBS linewidth values with participants' measurements showed that most differences were less than ±0.3 μm. A linewidth calibration significantly reduced systematic errors for most systems. (36 refs.)

06.30G Velocity, acceleration and rotation measurement

(for flow velocity measurement see 47.80)

117154 Theoretical foundations of a microprocessor based acceleration transducer. J.Bozicevic (Dept. of Measurement & Control, Univ. of Zagreb, Zagreb, Yugoslavia).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.115-24 vol.3
The theoretical foundations and mathematical model of a new acceleration transducer capable of sensing and measuring the acceleration in any direction are presented. One end of each of the six springs is attached to one of six less vertices of the octahedron frame, while their other ends are joined together in the centre of the octahedron frame. This joint is made as the free moving seismic mass. The springs are relative displacement sensors which give information into a microcomputer programmed to compute the vector of acceleration. (1 ref.)

117155 A special-purpose microcomputer in instrumentation. M.Franc.
Jemna Mech. & Opt. (Czechoslovakia), vol.28, no.8, p.221-2 (Aug. 1983). In Czech.
On the basis of the I 8080 A microprocessor, the CI-100 integrator has been developed whose main function is processing of analogue signals from chronotographic detectors. The integrator enables real-time sampling of the chromatographic signals, their analysis and processing and printout on a thermally sensitive alphanumerical printer. Both hardware and software of the system are briefly described. (no refs.) *E.D.*

117156 A high-speed, multi-input serial-interfacing system for a computer with simultaneous back-up recording on magnetic tape. A.H.Andeweg.
Report M52, Council for Miner. Technol., Randburg, S. Africa (21 March 1983), 41 pp.
A system has been developed that interfaces nuclear-instrument data modules and a multichannel analyser into a computer. The interface converts 4-bit binary-coded decimal data into 8-bit packed BCD data, and the parallel data into serial data. The data are transmitted up to a distance of 500 m at a transfer rate of 153.6 kbaud via an RS422 transmission link to a central computer system. One or more multichannel analyser systems can be connected to the system via a routeing device which serves these analysers on a first-come-first-served mode. The data transmitted to the computer system are recorded simultaneously on a digital magnetic-tape drive to provide a back-up facility. (2 refs.)

117157 Sample carousel transfer mechanism. D.H.Fearon, H.F.Helbig, S.A.Steward, F.S.Uribe (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1558-60 (1983).
Describes a carousel transfer system, designed and built for use in the authors' laboratory. The system consists of four modified commercial components, a load/process chamber, a horizontal long-travel linear manipulator (LM), a 12-sample carousel, and a vertically mounted high precision manipulator (HPM) in the analysis chamber. There are 100 cm (4 in.) and 150 cm (6 in.) diam. windows facing the experimenter in the load/process chamber and the analysis chamber, respectively. These windows allow the experimenter to observe and control the carousel transfer. The window of the load/process chamber is removed to change carousels. (2 refs.)

117158 Modification of platinum carrier for micro combustion flask (Thomas-Schoniger type). H.H.Whitaker, B.L.Goydish.
RCA Tech. Not. (USA), no.1331, p.1-2 (2 Sept. 1983).
For the analysis of carbon black samples using a Schoniger oxygen combustion flask, the authors have found that the platinum carrier equipment is not adequate in two respects: samples of carbon blacks having low impurity levels cannot be made large enough for accurate analysis; and inadequate combustion occurs. They have found that by using a larger platinum carrier of much finer mesh size, larger samples of carbon black can be used which nevertheless provide complete combustion of the samples for further analysis, without advance preparation of the samples or separation of residues after combustion. 06.70 GENERAL INSTRUMENTATION

117159 Basic study on foil strain gauges made of electrodeposited copper or nickel. M.Seika, Y.Nagase (Faculty of Engng., Nagoya Univ., Nagoya, Japan), K.Hosono, C.Kato.
Bull. JSME (Japan), vol.26, no.216, p.946-53 (June 1983).
In order to utilize plating foils made of acid copper and nickel as strain gauges, basic properties of the plating foils are examined under rotating bending loads. The results obtained are as follows: (1) When the final deposited surface of a nickel foil is used as the cementing surface, which is named 'the inside foil', applicable test temperatures are within the range of 100-300°C. (2) When the inside foil of nickel is preheated at a temperature slightly lower than the recrystallization temperature of the foil for a short while, it can be used even at room temperature just as the copper foil. (3) The acid copper or nickel foil consisting of one layer without a basal plating of alkaline copper can give values with sufficient accuracy. (8 refs.)

117160 GEC research—sensors. G.R.Jordan (Marconi Res. Centre, Chelmsford, England).
J. Phys. E (GB), vol.16, no.10, p.931-2 (Oct. 1983).
The commercial activities of GEC range from the consumer and industrial sectors to the advanced military, avionic and aerospace industries. In all these diverse areas there is an urgent need for new forms of sensors, sensors which have improved performance over available devices, are reliable, low cost and preferably have a digital output. The developments discussed encompass the widest possible range of sensors and include vibratory devices, optical, optomechanical, optoelectronic and optical fibre sensors, integrated semiconductor sensors, ultrasonic and materials-based devices. These programmes are supported by the extensive signal processing and microprocessor expertise within the GEC company. (no refs.)

117161 Sensors and their applications. P.A.Payne (Dept. of Instrumentation & Analytical Sci., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England).
J. Phys. E (GB), vol.16, no.10, p.947-51 (Oct. 1983).
A number of market surveys are used to provide guidance on the growth rates within various sectors of the sensor market. A number of economic factors are considered which will have a serious bearing on the develpment of the sensor market. The manner in which research and development organisations, and also educational institutions, will need to adapt in order to respond to these changes is discussed. (25 refs.)

117162 Sensors for mechanical properties. R.S.Medlock (Brown Boveri Kent plc, Luton, England).
J. Phys. E (GB), vol.16, no.10, p.964-72 (Oct. 1983).
The range of mechanical measurands considered include spatial variables, velocity, acceleration, mass, force and other physiomechanical qualities such as viscosity, hardness and phase concentration. Attention is drawn to the problem of terminology and classification. Transduction techniques used in a large number of sensors are described by numerous line diagrams each with a brief explanation. Some indications are given of trends in future development from which it is concluded that electronic and optoelectronic microchips could play an important role in sensor technology of the future. (6 refs.)

117163 Optical systems and sensors for measurement and control. B.Culshaw (Dept. of Electronic & Electrical Engng., Univ. of Strathclyde, Glasgow, Scotland).
J. Phys. E (GB), vol.16, no.10, p.978-86 (Oct. 1983).
The author discusses the future roles of optical fibre systems in instrumentation and draws attention to some of the potential areas in which current developments in opto-electronics may well considerably expand the applications arena. The major possibilities include the all optical sensor and actuator system, the incorporation of passive signal processing, analogue-to-digital conversion and passive delay line multiplexing, and the impact of advanced optical technology including single mode optics and integrated optic concepts. Some potential systems are described which illustrate the considerably increased role for optical techniques in instrumentation. (32 refs.)

117164 A membrane-type zero pressure-difference indicator. S.Glowka, A.Fiutkowski (Inst. Chem. Fizycznej Polskiej Akad. Nauk, Warsaw, Poland), A.Lazuchiewicz.
Pomiary Autom. Kontrola (Poland), vol.29, no.4, p.113-14 (April 1983). In Polish. [received: Sept. 1983]
The authors describe the design and operation of a zero pressure-difference indicator which permits to separate the liquid of gaseous phase from a neutral gas in pressure measurement and to indicate a pressure difference of 1.10^{-5} MPa within 0-60 MPa. (6 refs.)

117165 Radiation field of a plane waveguide into an elastic space. S.A.Fedorov, V.L.Tsvetyanskii (Rostov-on-Don State Univ., Rostov, USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.2, p.100-4 (Feb. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.2, p.26-32 (Feb. 1983). [received: Oct. 1983]
A study is made of the radiation field from a piezoelectric transducer plus a plane waveguide into an elastic half space, with due regard for the dispersion of the normal waves. The distortions of the radiation-field's characteristics are shown for monochromatic and pulse modes. (9 refs.)

117166 A review of mathematical modelling of instrument transducers. F.Abdullah, L.Finkelstein (Phys. Dept., City Univ. London, London, England).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.145-57 vol.3
The application of mathematical models to a range of common instruments is discussed. These include diaphragms, capsules and Bourdon tubes for pressure sensors; load cell billets for force measurement; inductive and capacitive displacement sensors; magnetic circuits for instruments; a common solenoid actuator; the orifice plate flow meter; a hydrodynamic oscillator flowmeter and a common industrial platinum resistance thermometer assembly. A computer package, MEDIEM, for modelling the dynamic response of instrument systems is also described. It is concluded that in future, mathematical models and particularly computer models will form a valuable tool to aid in instrument design and evaluation. (25 refs.)

117167 A study on some problems of the eddy-current probes and frequency modulated circuit. Fu Shang-xin, Feng Guan-ping, Lu Dao-jiang, Chen Li-ji (Dept. of Precision Instruments, TsingHua Univ., Beijing, China).
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.17-25
In noncontact measurement of displacement and vibration, the method of the L value measurement and the frequency modulated circuit are introduced. The equislope characteristics of the f-h curve, the correction for linearity and the compensation of thermal effect are studied both theoretically and experimentally. (3 refs.)

117168 Study on vibratory movers. Moving velocity and control of moving direction. S.Okabe, Y.Yokoyama.
J. Jpn. Soc. Precis. Eng. (Japan), vol.49, no.6, p.789-95 (June 1983). In Japanese.
Treats the method of moving a particle by means of vibratory actuator which is attached to the particle. These devices are named vibratory movers. When a particle is moved without jumping on a sliding surface, the motion of the particle is represented by the combinations of three basic motions, i.e. positive slip, negative slip and stick motion. Therefore the moving velocity of the particle is not uniform throughout one period of vibration due to intermittent sticking and slipping motions, and the mean moving velocity must be calculated. The vibratory movers are classified into three types according to the structure. They are direct actuated type, multidegrees-of-freedom type and electromagnet type. In this paper, the direct actuated type and two-degrees-of-freedom type are discussed analytically. In the direct actuated type, the equations of motion of the particle are similar to those of vibratory conveying. The relations between moving conditions and moving velocity are shown by various diagrams, and the optimum moving conditions are considered. The control methods of moving direction are discussed also. It has been confirmed that the above theoretical results agree well with experimental ones. (4 refs.)

117169 A wireless extensometric torquemeter for use on rotary objects. T.Sidor (Akad. Gorniczo-Hutniczej, Krakow, Poland).
Pomiary Autom. Kontrola (Poland), vol.29, no.4, p.125-6 (April 1983). In Polish. [received: Sept. 1983]
The author describes an extensometric torquemeter with a wireless power supply to the system. The measurement signal converted into frequency by a miniature electronic converter which rotated together with the strain-gauges, modulates through a change of loading the voltage across the stationary winding of the transformer which also serves as a power supply to the converter circuit. The signal obtained after a double demodulation (amplitude and frequency) is converted into a voltage proportional to the torque being measured. (4 refs.)

07.20 THERMAL INSTRUMENTS AND TECHNIQUES

(see also 44.50 Thermal properties of matter, 44.60 Thermodynamic processes; for radiometry and detection of thermal radiation see 07.60D and 07.62)

117170 Thermal microscopes. M.Luukkala.
Acta Polytech. Scand. Appl. Phys. Ser. (Finland), no.Ph138, p.103-7 (1983).
The authors describe the principles behind a so called thermal microscope, where thermal waves of a short wavelength are used to probe the surface of various materials. Surface and subsurface cracks, delaminations and various coatings and surface layers can be detected with the thermal microscope. In particular, the surface thermal waves are a quite sensitive to surface flaws. The author has measured the depth of surface hardened steel with the present instrument. (2 refs.)

117171 Thermal wave piezoelectric and microphone detection for nondestructive evaluation: a comparison. G.Busse (ZWE Phys., Hochschule der Bundeswehr Munchen, Munchen, Germany), A.Rosencwaig.
J. Photoacoust. (USA), vol.1, no.3, p.365-9 (1982-1983). [received: Oct. 1983]
Results are presented for thermal wave imaging based on piezoelectric and microphone detection. It is found that both for signal phase and magnitude imaging the depth range is larger with piezoelectric detection. (12 refs.)

117172 A method for analysing the heat conductivity of ceramic porous materials. Z.Ignaszak (Politech. Poznanskiej, Poznan, Poland).
Pomiary Autom. Kontrola (Poland), vol.29, no.6, p.190-2 (June 1983). In Polish.
The significance of investigating the thermal and physical properties of ceramic porous materials, especially their heat conductivity VS temperature is discussed. The author describes the instruments and a station for investigating heat conductivity, presents the results of tests and an original way of interpretation of the curves of isothermic surfaces, included in calculations of the heat conductivity coefficient. (7 refs.)

117173 Elements of thermography for nondestructive testing. J.Cohen.
Report NBS-TN-1177, Nat. Bur. Stand., Washington, DC, USA (May 1983), vi+28 pp.
Presents an elementary review of thermal imaging systems, with emphasis on the application of thermography to nondestructive testing. Topics discussed include heat radiation theory; early and contemporary thermal imaging systems; performance characteristics; effects of emissivity, background temperature, atmosphere, and field of view. Examples of various applications of thermography to nondestructive testing are given. A bibliography is included. (22 refs.)

07.20D Thermometry

117174 Thick film resistors in low-temperature resistance thermometry in high magnetic fields. N.Koppetzki (Zentralinst. fur Festkorperphys. und Werkstofforschung, Akad. der Wissenschaften, Dresden, Germany).
Cryogenics (GB), vol.23, no.10, p.559-61 (Oct. 1983).
Thick film resistors exhibit a strong dependence on temperature in the cryogenic range below 20K. In this range the temperature coefficient of resistance is estimated to be comparable to that of commonly used resistance thermometers. The resistance change by the action of the magnetic field is observed to be only small and independent of magnetic field direction. By using these resistors in cryogenic resistance thermometry in intense magnetic field the temperature error due to the magnetoresistance is shown to be only small in comparison with frequently used sensors. According to these results thick film resistors are reported to offer an interesting alternative in cryogenic resistance thermometry within intense magnetic fields. (8 refs.)

117175 Nanokelvin thermometry at temperatures near 2K. V.Steinberg, G.Ahlers (Dept. of Phys., Univ. of California, Santa Barbara, CA, USA).
J. Low Temp. Phys. (USA), vol.53, no.1-2, p.255-83 (Oct. 1983).
Presents a method of temperature measurement based on a liquid ^{3}He vapor pressure thermometer with a resolution of one part in 10^9 of the absolute temperature over the range from 1.6 to 2.2K. The thermometer, as well as apparatus suitable for the assessment of the resolution and stability of the device, are described in detail. A method for the determination of a fixed point on the temperature scale with a resolution of 2×10^{-9} is presented. Two different procedures for monitoring the long-term stability of the thermometer are discussed. The present resolution and stability of the thermometer are an improvement by two orders of magnitude over conventional germanium resistance thermometry. Although this performance level is adequate for presently planned phase transition experiments using liquid ^{4}He, future improvements by yet another order of magnitude seem feasible and will bring the device within an order of magnitude of the thermal noise limit. (34 refs.)

117176 Digital temperature gauge for your car. F.L.Young,Sr., F.L.Young,Jr..
Radio-Electron. (USA), vol.54, no.8, p.92-5 (Aug. 1983).
Describes the design of a digital thermometer that can be used to monitor the car's engine temperature. The design is based on the CA3161E and the CA3162E ICs. A schematic of the thermometer is shown. CA3162E, a dual-slope, dual-rate ADC translates an incoming analog signal into a digital BCD number, then CA3161E (a BCD-7-segment decoder/driver) converts that number into signals which lights up the display. The power for the entire circuit is derived from a 340T-5 five-volt regulator. The temperature probe is a diode attached to the end of a coaxial cable. (no refs.)

117177 Determination of detector dependent radiation factors in an infrared image creating system. N.Bacso (Service of Heat Process Control, Hungarian Electricity Board, Budapest, Hungary).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.483-92 vol.1
The physical relationships of temperature measurement based on infrared radiation are outlined. Measuring uncertainties from wavelength dependence of radiation coefficients and of detector sensitivity are pointed out. A new measuring method is presented, along which the image creating temperature

measuring instrument itself can be used in industrial practice for measuring the radiation coefficients with sufficient accuracy, and for determining the well-defined tolerances thereof. (5 refs.)

117178 Instrument for the measurement of transient temperature (IMTT)—an apparatus for automatic correction of transient and radiative errors of the thermocouple. Zhu Dezhong, Cui Xiaomin (Dept. of Engng. Mech., Tsinghua Univ., Beijing, China).
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.27-33
When the fluctuating temperature of a hot gas stream is measured by means of a thermocouple, it is necessary to correct the transient and radiative errors. The IMTT is based on the thermal equilibrium equation for the hot junction of the thermocouple, and can be used to correct the above mentioned errors according to the measured values of the hot junction temperature and the gas stream velocity. The error-corrected temperature value is displayed on a digital voltmeter and is plotted out by a recorder. The IMTT can be used to measure the temperature field by the fast sweep method, the fluctuating temperature by the fixed position method and temperatures that exceed the melting point of the thermocouple materials with an injection thermocouple. (3 refs.)

117179 Update on the versatility of infrared thermometry. M.M.Everest (Everest Intersci., Tustin, CA, USA).
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.431-40
Discusses advances in the state-of-the-art of infrared thermometry which have expanded the versatility of non-contact infrared thermometry. The breakthrough of the capability of reading temperatures with 0.1°C precision and ±0.5°C accuracy instantly, coupled with intra-optical light sighting and microscopic capabilities, have opened the doors of infrared thermometry to many additional markets. The ability of infrared thermometers to read the temperature differential between the ambient air temperature and the absolute temperature of the intended target automatically, has further expanded their capabilities. The areas where infrared thermometry can be used are indicated. (23 refs.)

117180 Measurement methods of emission factors between 200 and 1500°C. F.Millet (Dept. Materiaux et Procedes, SNECMA, Suresnes, France).
Rev. Gen. Therm. (France), vol.21, no.251, p.879-91 (Nov. 1982). In French. [received: Oct. 1983]
SNECMA has developed methods for measuring the radiative properties of materials for their application to industrial problems (temperature determination and heat balances). The author describes the measurement of the normal monochromatic emission factor of a material from 200 to 1500°C, for a mean pyrometer wavelength centered around 0.65 μm or 2.2 μm (equipment with built-in black body); the measurement of the directional monochromatic emission factor from 250 to 750°C for a mean pyrometer wavelength centered around 2.2 μm (equipment with reference coating); measurement of the total hemispheric emission factor from 200 to 1500°C. The author points out the basic assumptions made (opaque material; emissivity independent of wavelength and direction in the pyrometer wavelength band; equal monochromatic emissivity and absorptivity at a certain temperature) and discusses the principle of the method, the measurement system, the field of application and the limitations, as well as accuracy. He also describes the calibration of the pyrometers employed. (no refs.)

117181 Optical pyrometry in steel industry. G.Heitz, J.Philippe (Inst. de Recherches de la Siderurgie Francaise, IRSID, Saint-Germain-en-Laye, France).
Rev. Gen. Therm. (France), vol.21, no.251, p.893-9 (Nov. 1982). In French. [received: Oct. 1983]
The authors show the importance of this temperature measurement technique which is utilised in nearly all the sectors of steelmaking and most particularly in the following fields: reheating furnaces, rolling mills and blast furnaces. The text mentions problems generally encountered by the operators like partial misreading of the emissivities or very hard environment. The solutions proposed by the twenty-six optical pyrometer, tradesmen present on the French market are briefly introduced. Finally the text describes the IRSID contribution to the optical pyrometry evolution by its active collaboration with ministerial or private organisms, the development of its own work like the creation of reference laboratories, evaluation of pyrometer performance, adaptation of new products, formation of technicians and engineers to this technique. (no refs.)

117182 Microcomputer-controlled cooled optical pyrometer with 15 sensors for adverse operating conditions. J.Weber, A.Fabiunke (AEG-Telefunken, Berlin, Germany).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.455-62 vol.1
Describes a microcomputer-controlled optical pyrometer which was developed for the measurement of high temperatures within a range of 700 up to 1500°C, and which is to be installed in the field of continuous costing plants with rough environmental conditions. Special features, i.e. functional, mechanical and electronic design of the measuring device as well as program flow and technical details in realisation are emphasized. (no refs.)

07.20M Cryogenics

117183 Large-scale applications of dilution refrigerators. T.O.Niinikoski.
Acta Polytech. Scand. Appl. Phys. Ser. (Finland), no.Ph138, p.144-51 (1983).
The author discusses the optimum design of dilution refrigerators and their large-scale applications in cryopumping, gravitational radiation antennas, polarized targets, neutrino telescopes, and in the production of stable atomic hydrogen or deuterium for intense polarized atom and ion beams. These beams might be useful in polarized plasma fusion reactors. (13 refs.)

117184 Thermal impedance of pressed contacts at temperatures below 4K. K.-H.Yoo, A.C.Anderson (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).
Cryogenics (GB), vol.23, no.10, p.531-2 (Oct. 1983).
Enhancement of thermal resistance at mechanical contacts between cryogenic components by using a thin plate of sapphire is described. (13 refs.)

117185 Cryostat for testing luminescence and radiation absorption in ionic crystals. T.Halaczek (Polish Acad. of Sci., Wroclaw, Poland), W.Jelenski, A.Niklas, R.Wiechula.
Cryogenics (GB), vol.23, no.10, p.533-4 (Oct. 1983).
A cryostat is described whose construction makes optical and X-ray examination of cryostals possible within the temperature range 70-500K. The cryostat is equipped with two quartz glass windows, one metallized mylar window, and a sorption pump which allows an integral vacuum of the order of 10^{-3} Pa to be maintained during measurements. A handle allows specimens to be turned by 180° so that an optimum position is obtained in relation to the window. (1 ref.)

117186 On the factors affecting the performance of a continuous flow cryostat. B.R.Madhu, P.S.Narayanan (Dept. of Phys., Indian Inst. of Sci., Bangalore, India).
Indian J. Cryog., vol.8, no.2, p.91-4 (1983).
A continuous flow cryostat is known to have several advantages over a dewar cryostat. It is better suited where temperature adjustment over a wide range is necessary. A continuous flow cryostat was therefore designed for the temperature range 80K to 300K for the study of dielectric and thermal expansion behaviour of solid samples, which has to be done at high vacuum (about 10^{-5} torr). In the cryostat fabricated for such studies, temperatures up to 150K could be reached by increasing the opening of a control valve near the suction pump. Further opening of the valve for obtaining temperatures lower than 150K revealed a slow oscillation of temperature in the range between 150K and 125K. A possible reason for the same is given and the three methods tried out for avoiding the temperature oscillations are explained. With suitable modification, the cryostat was found to be capable of operation in the desired range satisfactorily. (6 refs.)

117187 Unsteady state heat transfer in superinsulated liquid nitrogen dewars. S.Arunachalam, S.Jacob, S.K.Rengan, R.Srinivasan (Dept. of Phys., Indian Inst. of Sci., Bangalore, India).
Indian J. Cryog., vol.8, no.2, p.99-102 (1983).
The unsteady state heat transfer and temperature distribution of a superinsulated liquid nitrogen storage dewar has been studied and the results are analysed based on the simple conduction model of heat transfer. The short time behaviour of the evaporation rate is estimated and compared with experimental data. The contribution of radiation heat transfer is evaluated from the steady state temperature distribution of multilayer insulation. Preliminary experimental results on the in-situ treatment of adsorber material for improving its adsorption capacity is discussed. (3 refs.)

117188 Heat transfer and temperature profile studies in cylindrical cryogenic glass dewars. S.Arunachalam, S.Jacob, S.K.Rengan, R.Srinivasan (Dept. of Phys., Indian Inst. of Sci., Bangalore, India).
Indian J. Cryog., vol.8, no.2, p.103-7 (1983).
The heat transfer components and inner wall temperature profiles of a cylindrical, cryogenic glass dewar have been studied as a function of the level of liquid nitrogen in the dewar. The study shows that the gas conduction heat transfer is further enhanced with fall of liquid level in the dewar, due to the increase in interspace gas pressure. A simple analysis based on Corruccini's gas conduction equation is presented for the explanation of the observed gas conduction heat transfer. The inner wall temperatures are found to be nearly linear, except in the regions close to the liquid surface. (4 refs.)

07.25 HYGROMETRY

117189 Moisture measurement simplified by electronics. A.Girschweiler (Microtecnic, Lausanne, Switzerland).
Microtecnic (Switzerland), no.3, p.45 (1983).
Easy-to-operate electronic hygrometers which can be calibrated by unskilled assistants and need little or no maintenance can now tackle virtually any problem involving measurement of the moisture content of dry gases. Instruments and sensors can take single- or multi-channel measurements and provide alarms or permanent records. They can operate under normal conditions, at high pressures or in hazardous areas and may also be portable, in-line and/or weatherproof. High-capacitance moisture-sensors provide continuous output readings at mains frequency without the use of amplifiers. The author describes four basic interchangeable sensors for dewpoints between −80°C and +20 °C and a chart for the calculation of moisture equivalents. (no refs.)

117190 Bifilar helix hygrometer. A new fast response sensor for sampling application. W.Leisenberg, T.Gast (Inst. fur Mess- und Regelungstech., Tech. Univ. Berlin, Berlin, Germany).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.87-94 vol.3
The incentive for the development and the field of application for the presented sensor are explained. After representation of the basic process of measurement the mechanical and electronic components of a prototype with their respective function are described. The influences on the attainable accuracy are discussed. (2 refs.)

07.30 VACUUM PRODUCTION AND TECHNIQUES

(inc. pressures below 1 atmosphere; see also 47.45 Rarefied gas dynamics; 81.15G Vacuum deposition)

117191 A simple, controllable source for dosing molecular halogens in UHV. N.D.Spencer, P.J.Goddard, P.W.Davies, M.Kitson, R.M.Lambert (Dept. of Phys. Chem., Univ. of Cambridge, Cambridge, England).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1554-5 (1983).
An electrochemical source for the reproducible generation and dosing of halogens in UHV systems is described. This approach minimizes corrosion damage to vacuum hardware and lends itself to the study of both submonolayer and multilayer halogen adsorption. The corrosive action of halogens on ultrahigh vacuum components has necessitated the development of molecular halogen beam sources, which allow in situ generation and dosing of fluorine, chlorine, bromine, and iodine, with a negligible increase in vacuum chamber background pressure. This communication describes the chlorine and bromine sources developed and routinely used in the authors' laboratory. Iodine dosing may be accomplished using a source of similar design. Fluorine, however, because of its highly reactive nature, requires a somewhat different design of source, such as that recently described in detail by Bechtold (1981). (13 refs.)

117192 A simple and efficient internal heater for baking vacuum systems. A.D.LeGrand, E.F.Greene (Metcalf Chem. Labs., Brown Univ., Providence, RI, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1556-7 (1983).
A simple and convenient method for baking a vacuum system is described which requires less power and shorter bakeout time as compared to conventional baking methods. (3 refs.)

117193 World-wide directory of manufacturers of vacuum plant, components and associated equipment—1983. B.Halliday.
Vacuum (GB), vol.33, no.8, p.457-96 (Aug. 1983).
This Directory has been compiled from the answers to questionnaires sent to nearly 500 companies world-wide. There are 20 countries represented with more than 200 entries. The Directory is divided into countries and where applicable an index by component is available. All companies have their full name, address, telephone and telex numbers (where provided by the company). The three major sections for Australia, United Kingdom and United States have the company products tabulated, but the other countries with a less extensive number of entries have been set out with the products listed under the manufacturers' name. Where a large international company is mentioned, the products are shown under that company's home country only to which reference can then be made. A full index to companies' addresses is included at the end. (no refs.)

07.30C Vacuum pumps

117194 VAROVAC rotary-vane vacuum pumps for multiple use. H.-P.Berges, G.Knorr, H.Litterscheid, G.Oswald (Leybold-Heraeus GmbH, Koln, Germany).
Vak.-Tech. (Germany), vol.32, no.6, p.174-9 (Sept. 1983). In German.
Modern process technology requires versatile vacuum pumps suitable for industrial applications and meeting the ever increasing demands with respect to high reliability in operation, low operating cost, easy maintenance, low environmental pollution, low noise level, low ultimate pressure, high pumping speed and compact construction. At the example of the VAROVAC S 630 F it is shown how these requirements were met by the development of a comprehensive pump series of new engineering concept based on the well-proved design of directly driven, oil-sealed rotary vane vacuum pumps. The essential constructional features are explained, such as forced lubrication, airing/isolation valve, integrated exhaust (oil mist) filter, isolated, greased bearings, low noise level and integrated operation controls. (no refs.)

07.30D Vacuum meters

117195 A new axial-emission self-modulating UHV ion gauge. J.Z.Chen (Shanghai Electronic Vacuum Device Inst., Shanghai, China), C.D.Suen, Y.H.Kuo.
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.245-9
An axial-emission self-modulating ultra-high vacuum ion gauge (AESMG) based on the developments of the axial-emission ion gauge (AEG) is described. The self-modulation technique used in the AESMG operates by means of changing the potential of the collector. The AESMG has some advantages such as high sensitivity, simplicity of structure and the fact that the modulating coefficient of soft X-ray photocurrent is almost equal to unity. The limiting measurable pressure of the AESMG is about 2×10^{-12} torr. (4 refs.)

07.35 HIGH PRESSURE PRODUCTION AND TECHNIQUES

(inc. pressures above 1 atmosphere)

117196 Testing of strain-gauge pressure transducers up to 3.5 MPa at cryogenic temperatures and in magnetic fields up to 6 T. G.Cerutti, R.Maghenzani, G.F.Molinar (Istituto di Metrologia, Nat. Res. Council of Italy, Torino, Italy).
Cryogenics (GB), vol.23, no.10, p.539-45 (Oct. 1983).
The characteristics of four commercial strain-gauge pressure transducers suitable for measurements in a temperature range from 4.2 to 293K were determined in the presence of magnetic fields up to 6 T. The highest pressure measured was 3.5 MPa. Tests showed that if the transducers are used in these conditions and no corrections are made, uncertainties up to 19% of the transducer full scale may be inherent in measurements. When such high error levels are unacceptable, the transducers must be individually calibrated under the working conditions: in this way the uncertainties in pressure measurements can usually be kept below 1% of the transducer full scale. (6 refs.)

07.50 ELECTRICAL INSTRUMENTS AND TECHNIQUES

117197 Oscillometric flow cell for measurement of conductivity and permittivity. E.Pungor, F.Pal, K.Toth (Inst. for General & Analytical Chem., Tech. Univ., Budapest, Hungary).
Anal. Chem. (USA), vol.55, no.11, p.1728-31 (Sept. 1983).
Reports on a new flow-through oscillometric high-frequency conductance microcell which is suitable for the measurement of conductivity or permittivity of streaming solutions or solvents. The electrodes of other cell are not contacting galvanically the measuring solution; thus a good stability of the electrode surface layer and consequently good reproducibility of the measurements can be ensured. The volume of the concentric flow cell can vary between 10 and 50 μL. (24 refs.)

117198 Contribution to the application of microwave radiometry in the field of remote sensing. K.Gruner, W.Keydel, H.Suss (Inst. fur Hochfrequenztech., DFVLR, Oberpfaffenhofen, Germany).
NTZ Arch. (Germany), vol.5, no.8, p.223-31 (Aug. 1983). In German.
The principal objective of microwave radiometry is the detection of natural, incoherent microwave radiation emitted from different objects. The advantages of microwave radiometry over infrared systems are mainly the all-weather capability, the possible subsurface penetration capability of microwaves and the large contrast range available. These advantages open a wide spectrum of possible applications of microwave radiometry in remote sensing. Therefore, several application areas are shown and measurement results are given as examples for various applications. (13 refs.)

117199 Electric and magnetic field sensor for simultaneous electromagnetic near-field measurements - Theory. M.Kanda.
Report NBS-TN-1062, Nat. Bur. Stand., Washington, DC, USA (April 1983), 30 pp.
Describes the theory of a single sensor to perform simultaneous electric and magnetic near-field measurements. The theory indicates that it is possible to obtain the magnetic-loop and electric-dipole currents using a loop terminated with identical loads at diametrically opposite points. The theory also indicates that it is possible to obtain an ideal load impedance for achieving equal electric and magnetic field responses of the loop. Preliminary experiments have been performed using plane waves to verify these results. (3 refs.)

117200 The development of the reference standard cells and its prediction method. Hu Yanrui (Nat. Inst. of Metrology, China).
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.101-7
The author presents a prediction method and a technical procedure with which 274 standard cells were produced after a long-term (5-10 years) examination and performance tests of the standard cells. The mean year drift for most of these cells is less than 0.4 μV (4×10^{-7}), which means that the performance of these cells is better than that of conventional reference standard cells. (18 refs.)

07.55 MAGNETIC INSTRUMENTS AND TECHNIQUES

117201 Eddy current-induced stray magnetic field cancellation technique for B-H loop applications. R.W.Hamaker, P.J.Kobiela, F.P.Laming (IBM Corp., Armonk, NY, USA).
IBM Tech. Disclosure Bull. (USA), vol.26, no.3A, p.1285-7 (Aug. 1983).
The use of hysteresigraphic techniques to characterize the magnetic properties of both thick and thin film samples provides both a rapid and a reasonably accurate method for determining the B-H loop characteristics. (4 refs.)

117202 A clock-gaussmeter. S.Kaluza, J.Pszczola (Politech. Swietokrzyska, Kielce, Poland).
Pomiary Autom. Kontrola (Poland), vol.29, no.3, p.84-6 (March 1983). In Polish. [received: Sept. 1983]
The authors describe a new method of measuring magnetization or magnetic susceptibility of magnetic substances. This method is based on determination of the oscillation period of a pendulum with a sample having a magnetic moment in a heterogeneous magnetic field. A measuring system, which has been constructed and proved to be efficient, is presented. Operation of this system is similar to that of a clockwork one. The measuring facility of the clock-gaussmeter, with its pendulum placed in a cryostat, may be used for measurements in low temperatures. (6 refs.)

117203 On the possibility of automating a compensated permeammeter. J.R.Przygodzki (Politech. Swietokrzyskiej, Kielce, Poland).
Pomiary Autom. Kontrola (Poland), vol.29, no.4, p.110-11 (April 1983). In Polish. [received: Sept. 1983]
Operation principle of an automated compensated permeammeter is discussed. This instrument is a modification of a known permeammeter Picou-Illiovici, developed in order to eliminate the drawbacks; it can be used for testing materials in the form of straight samples of any value of the permeability. (4 refs.)

117204 Weak coupling devices in magnetometry. T.D.Clark, R.J.France.
Rev. Polytech. (Switzerland), no.8bis, p.897-903, 1015 (Aug. 1983). In French.
The theory and application of weak coupling devices in magnetometry are explained. The basic element of these magnetometers is usually called 'Quantum Interference Superconductor Device, abbreviated to SQUID. A further development is an extremely fast digital computer based on such 'Josephson' logic elements, which will also be of enormous capacity. (6 refs.) *J.S.*

117205 Inspection of the magnetic properties of carriers of magnetic recording. A.F.Reiderman (Inst. of Metal Phys., Acad. of Sci., USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.2, p.129-36 (Feb. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.2, p.57-66 (Feb. 1983). [received: Oct. 1983]
Explains the results of elaboration of methods and of a measuring device for inspecting the magnetic properties of carriers of magnetic recording, in particular for checking inhomogeneities of magnetic parameters. It examines gene-

ral problems of measuring weak magnetic fluxes in pulsed fields, the sources of errors, ways of improving the accuracy and sensitivity of the respective means of measurement. (11 refs.)

117206 Microprocessor magnetic measuring system. B.Matrakov, L.Baeva (Dept. of Electrical Measurements, Higher Inst. for Mech. & Electrical Engng., Sofia, Bulgaria).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.479-87 vol.3
Deals with the synthesis of the structure and the development of algorithms for the microprocessor measuring system. The system is based on the Ferrometer 03 and makes use of the MC 6800 microprocessor unit. The algorithms are elaborated at a program level. (4 refs.)

117207 Optical sensing and engineering metrology. S.Bennett (Div. of Mech. & Optical Metrology, NPL, Teddington, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.376, p.2-7 (1983). (Optical Sensing Techniques, Benefits, Costs, Teddington, Middx., England, 7-8 Dec. 1982).
Techniques of optical sensing are not new to engineering metrology and optical instruments have a long history of successful application in this field. Recent advances in the application of lasers, the development of detectors and the use of computers have produced many new optical techniques for making fast, accurate measurements of engineering parameters. The benefits of improved metrology accrue from assured compliance with specifications, lower failure rates and better performance. The application of new optical techniques reduces measurement time and shortens the calibration chain. (17 refs.)

117208 A new integrating raster microdensitometer.
Acta Medicotech. (Germany), vol.30, no.6, p.221-2 (Dec. 1982). In German.
The Vickers M85A, developed from the M85, is a flying spot scanning microdensitometer fitted with the optics of a Vickers M17 research microscope. The spot size is variable, the smallest diameter (0.25 μm for an objective of 100× magnification) approaching the limit of resolution of the microscope. The wavelength can be selected within the range 400-700 nm. The scanning time, fixed at 5 secs in the earlier unit, can now be varied between 1 and 16 secs. The high power microscope permits sharper focusing, and a TV camera or a photographic camera can be readily attached. Adjustments and routine measurements are simplified, the new unit having been designed to facilitate work in clinical laboratories, e.g. hormone bioassays and enzyme analysis. (no refs.) *D.J.B.*

117209 Multidimensional mapping of 178 Munsell colors. T.Indow, N.Aoki (Dept. of Psychology, Keio Univ., Tokyo, Japan).
Color Res. & Appl. (USA), vol.8, no.3, p.145-52 (Fall 1983).
In the right half of the Munsell color space from 2.5 R to 7.5 BG, 90 colors were selected, most of which were at the lightness level $V=7$, and in the left half from 2.5 BG to 7.5 R, 88 colors were selected most of which were at the level $V=4$. Of these 178 colors, 176 pairs in the right half and 185 pairs in the left half were subjected to the following color-difference judgement. Subjects, five in number, selected two grays for which the lightness difference matches a given color difference in size. Two matrices (incomplete) of color differences given in terms of V were processed by MDSCAL, and finally one configuration of 178 points was synthesized in a three-dimensional Euclidean space. Implications of the results are discussed in connection with results of previous similar studies which were based upon much smaller numbers of colors. (14 refs.)

117210 Parametric variations in a threshold color-difference ellipsoid for green painted samples. K.Witt, G.Doring (Bundesanstalt fur Materialprufung, Berlin, Germany).
Color Res. & Appl. (USA), vol.8, no.3, p.153-63 (Fall 1983).
Following the CIE guidelines for coordinated research on color-difference evaluation, a set of painted color samples was produced near the green reference color. Visual experiments were carried out by two different methods, absolute threshold and pair comparison. Perceptibility ellipsoids at and near threshold were determined for different mathematical models and for different groupings of observers. The main findings are: insensitivity to the method of optimization, inhomogeneity of the total set of answers but homogeneity within ranked observer groups, and change of volume but similarity of shape of the ellipsoids for extreme groups. Comparisons with other visual studies are discussed. (16 refs.)

117211 Influence of experimental parameters on the evaluation of color-difference ellipsoids. D.Strocka, A.Brockes, W.Paffhausen (Bayer AG, Leverkusen, Germany).
Color Res. & Appl. (USA), vol.8, no.3, p.169-75 (Fall 1983).
Using a set of red samples, the authors investigated the influence of the number of observers and samples on the accuracy of experimentally evaluated color-difference ellipsoids. The results show that an ellipsoid can be calculated with an accuracy corresponding to a mean error of calculated color differences below 10% if a set of about 50 samples is assessed 30 times by pair comparison, e.g. 15 observers twice each. (13 refs.)

117212 A national standardization program for spectrophotometry. F.W.Billmeyer,Jr. (Dept. of Chem., Rensselaer Polytech. Inst., Troy, NY, USA).
Color Res. & Appl. (USA), vol.8, no.3, p.182-6 (Fall 1983).
The Council for Optical Radiation Measurements proposes, with the collaboration of the National Bureau of Standards, to create and put into operation a national standardization program for ultraviolet, visible, and near-infrared wavelength-range spectrophotometers used for colorimetric and analytical measurements. The purpose of the program is to improve the shockingly poor performance exhibited by a large group of spectrophotometers in a collaborative reference program, shown elsewhere to correspond to about ten times poorer group accuracy than the inherent precision of the instruments. The central concept of the proposed national standardization program is to provide consistency with the NBS of a laboratory's capability for making accurate spectrophotometric measurements, in contrast to the traditional concept of the 'traceability' to the NBS of the calibration of a material standard. (17 refs.)

117213 Proposed indices of metamerism with constant chromatic adaptation. R.S.Berns, F.W.Billmeyer,Jr. (Dept. of Chem., Rensselaer Polytech. Inst., Troy, NY, USA).
Color Res. & Appl. (USA), vol.8, no.3, p.186-9 (Fall 1983).
It is proposed that when color differences or special metamerism indices calculated for several illuminants are to be correlated to appearance criteria, chromatic-adaptation transformations such as that of Nayatani et al. (1981, 1982) should be used to transform colorimetric data based on several illuminants to colorimetric data based on a single reference illuminant with a corresponding appearance space that is approximately uniform. The authors suggest that color differences, metamerism indices, and color constancy indices, calculated at constant chromatic adaptation by their proposed method, will give greater utility than indices calculated in the usual manner. A numerical example is appended showing the computations that are required. (7 refs.)

117214 Critical review of definitions of metamerism. A.R.Robertson (Div. of Phys., Nat. Res. Council, Ottawa, Ontario, Canada).
Color Res. & Appl. (USA), vol.8, no.3, p.189-91 (Fall 1983).
Some terminology in common use to describe metamerism and related phenomena is vague and confusing. This can and does lead to a lack of clarity of thought and to difficulty in understanding the phenomena. Such poor terminology cannot be supported. On the other hand, some 'textbook' definitions, although developed over many years and with much thought, have only a narrow application. Often they are theoretical rather than practical. This does not mean that they are wrong but that they are a base from which extended concepts and definitions can be developed. A clarification and expansion of terminology will enable problems to be defined in terms understandable to both color scientists and industrial colorists (see A.B.J. Rodrigues and R. Besnoy, ibid., vol.5, p.220-1, 1980). The present author's purpose is to suggest that this can be done in a modest but logical way without introducing a proliferation of new, and potentially confusing, terminology. (6 refs.)

117215 Scanning radiometer for calibrating thermal imager test targets. T.L.Williams (Sira Ltd., South Hill, Chislehurst, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.51-5 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Describes the design and performance of a radiometer working in the 8-12 μm wavelength range. The radiometer has a spatial resolution of 1 m radian and a noise equivalent resolution of 0.01°C. The main function of the radiometer is for calibrating thermal imager test facilities and in particular those used for measuring MRTD. It can be used to assess target temperature-uniformity, the effective emissivity of the targets and the zero temperature-difference errors. The radiometer operates in conjunction with a microcomputer which processes signals from the detector and from temperature sensors on a reference source to give absolute readings of the effective blackbody temperature of the target. (no refs.)

117216 Determination of the KTTs-5.048 colorimeter error when measuring the picture tube screen chromaticities. I.G.Alexandrova.
Tekh. Kino & Telev. (USSR), no.7, p.46-8 (July 1983). In Russian.
Considers some of the problems of using the C2000 colorimeter as a measurement reference means as well as the results of collating readings of several serial samples of the KTTs-5.048 colorimeter with C2000 colorimeter readings when measuring color picture tube screen chromaticities are given. (3 refs.)

117217 Distribution of external radiant fields of blackbody cavities. Chen Shouren, Chu Zaixiang, Chen Hongpan, Li Tieqiao (Precise Instruments Dept., Harbin Inst. of Technol., Harbin, China).
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.125-36
A new precise calculation of the external radiant field of cylindrical and conical cavities has been proposed. The outstanding advantage of this method is its flexibility for precise calculation of the integrated cavity emissivity for a detector in any geometrical configurations, especially for uncoaxial detectors. The distributions of the external radiant fields of some typical cavities have been solved by numerical integration techniques with the computer. Typical results are given. (9 refs.)

117219 On virtual fringe analysis method in focused double-exposure speckle photography. V.V.K.Karppinen (Dept. of Math. & Phys., Univ. of Joensuu, Joensuu, Finland).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.604-8 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
A virtual fringe analysis method can be applied to determine displacement vectors from speckle photographs. A diminishing of the visibility shifts dark and bright fringes from minima and maxima of the cosine. Then not only the bright fringes but the dark ones do give erroneous results. The analysing geometry can increase a reduction of the visibility. The author deals with the fringe visibility of virtual fringes and its effect on the fringe shifts. (5 refs.)

117220 Surface form measurement by heterodyne moire contouring. G.T.Reid (Dept. of Industry, Nat. Engng. Lab., Glasgow, Scotland).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.376, p.8-14 (1983). (Optical Sensing Techniques, Benefits, Costs, Teddington, Middx., England, 7-8 Dec. 1982).
Limitations in the densitometric analysis of moire contour patterns have been considered. A fringe analysis method based on heterodyne detection is described. The heterodyne method is shown to be comparatively insensitive to variations in the light-scattering properties of the surface and to allow automatic differentiation between concavity and convexity. (13 refs.)

117221 Role for automatic fringe analysis in optical metrology. D.W.Robinson (Div. of Mech. & Optical Metrology, NPL, Teddington, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.376, p.20-5 (1983). (Optical Sensing Techniques, Benefits, Costs, Teddington, Middx., England, 7-8 Dec. 1982).
The role of automatic fringe analysis in optical metrology is demonstrated by reference to a number of applications. The techniques of analysis range from binary to gray-level processing, for accurate dimensional metrology and accept-reject thresholdings. Applications include speckle interferometry, position location in three axes, holographic nondestructive testing and moire interferometry. (4 refs.)

117222 Application of Moire-stripes to automatic measurement of wear of pantograph sliders. K.Wada, A.Shioya, T.Sekine (Control Engng. Lab., Railway Tech. Res. Inst., Tokyo, Japan).
Q. Rep. Railw. Tech. Res. Inst. (Japan), vol.24, no.1, p.46 (March 1983). [received: Aug. 1983]
A test was conducted in order to develop a device for automatic measurement of the wear of pantograph sliders. A moire camera was installed on the ceiling of a repair house near the entrance of a car shed, and the wear of sliders was measured went cars when in and out of the shed. (no refs.)

117223 A highly precise and highly sensitive instrument for measuring optical retardation of birefringence. Zhang Hey, Zhang Yuan, Wang Taifu, Wang chu (Peking Univ., Peking, China).
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.219-25
Describes an instrument with high sensitivity and high accuracy for the measurement of the retardation of the birefringence of optical materials. It is based on the principle of polarisation interference and makes use of controlled electrooptic retardation. It satisfies the needs of the optical industry. Its operation is convenient and construction is simple. The result can be indicated by means of digital display. Its sensitivity is less then 1 Å, accuracy is equal to 2 Å (for measuring from 0 to 100 Å) and less than $^1/_{100}$ (for measuring range greater than 100 Å). (3 refs.)

117224 Interference rejection by auxiliary feeds in Cassegrain earth terminals. J.Arnbak, M.H.A.J.Herben, R.A.C.M.van Spaendonk (Dept. of Electrical Engng., Eindhoven Univ. of Technol., Eindhoven, Netherlands).
AGARD Conference Proceedings No.332. Propagation Aspects of Frequency Sharing, Interference and System Diversity. 31st Symposium of the Electromagnetic Wave Propagation Panel, Issy-les-Moulineaux, France, 18-22 Oct. 1982 (Neuilly-sur-Seine, France: AGARD 1983), p.38/1-11
Presently, satellite crowding in the geostationary orbit is becoming a serious restriction on further development of operations in the communication bands. The enormous investments already made in existing earth terminals does not encourage complete antenna replacements to achieve lower sidelobe envelopes. However, at WARC-79 the E-W stationkeeping tolerance was tightened significantly (to ±0.1°). Consequently, it will become feasible to coordinate two potentially interfering satellite networks in accordance with Appendix 29 of the Radio Regulations, simply by reducing a few specific sidelobes in the respective earth terminals. This may be achieved by a much simpler retrofit of any earth terminals constraining orbit occupancy. This paper reviews progress in an ongoing study of interferometric sidelobe supression by auxiliary feeds in Cassegrain antennas. The isolation improvements are explored and related to the feed geometry, orbital spacing between satellites, and required excitation levels. The system value of this modernization option is very relevant as an interference mitigation scheme in the various satellite networks now in widespread use. (12 refs.)

117225 Frequency plane filtering in a microscope. B.W.Reuter (Inst. fur Angewandte Phys., Gesellschaft fur Strahlen- und Umweltforschung mbH, Neuherberg/Munchen, Germany).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.459-66 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
An opto-electronic hybrid system for automated near real-time processing of microscopic samples has been developed. Spatial frequency plane filtering techniques adapted to a commercial microscope are used for fast preprocessing. The noise problem was substantially reduced by use of either a moving point-like light source or by a spatially extended light source. Calculations and experiments show the conditions under which the influences of the extension of the source for both methods onto high-pass, band-pass and gradient filtering can be neglected. The system has been used for the automated evaluation of cytological smears and for detection of asbestos fibers in membrane filters. (11 refs.)

117226 Direct microscopic and microholographic observations of the solidification of particles from rapidly stirred melts. R.J.Smeulders (Dept. of Appl. Phys., Delft Univ. of Technol., Delft, Netherlands), F.H.Mischgofsky, H.J.Frankena.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.482-92 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
A microscopic set-up to observe fast moving solidifying particles during stir casting is described. The set-up consists of a ruby laser and a frequency doubled Nd^{3+}:YAG laser, a model device of an actual stir casting apparatus filled with a transparent organic alloy, melting at a low temperature and three different recording systems. Using a neopentyl alcohol alloy as a model substance for metal alloys, the crystallization process is studied by direct observation. Pulses from both lasers are used to provide a sufficiently short exposure time to take (simultaneously) holograms, microphotographs and videorecordings of the fast moving (flow rates up to 10 ms^{-1}) small particles with sizes in the order of $10\text{-}10^3$ μm. Primarily solidified particles appear to have equiaxed dendritic shapes. The longest diameter of these particles attain a maximum for low stirring rates and high cooling rates. After a period of stirring, some of the dendrite tips grow and transform the particle shapes into more spherical ones. At this stage the morphology of the solidified particles shows a good similarity with stir casted metal alloys. (17 refs.)

117227 **Speckle in confocal scanning optical microscopes.** E.R.Mendez (Blackett Lab., Imperial Coll., London, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.632-6 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).

Using a 'free' propagation model, the author examines the statistical properties of speckle patterns in confocal scanning optical microscopes. Both reflection and transmission geometries are considered. Expressions for the contrast in both in and out of focus planes are derived in terms of the statistical parameters of the rough surfaces and the geometry of the optical system. The results are evaluated numerically and compared to experimental data. (8 refs.)

117228 **Quantitative serial sectioning analysis: preview.** R.T.DeHoff (Univ. of Florida, Gainesville, FL, USA).
J. Microsc. (GB), vol.131, pt.3, p.259-63 (Sept. 1983).

Quantitative serial sectioning analysis provides all of the geometric information that is available from ordinary stereological analysis. In addition, it circumvents the weaknesses inherent in geometric models that are used to estimate distribution functions and topological properties. It further makes accessible some geometric aspects of microstructures that are not available stereologically, even with model assumptions. At the present state of the art it requires a prodigious effort to prepare and analyse a single sample from a single specimen. However, the current generation of image analysing computers already has the capability of automating data collection and analysis, and there is reasonable potential for automating the sample preparation procedure. Quantitative serial sectioning analysis would render obsolete all of the elegant geometrical probability arguments of stereology. Is it the wave of the future?. (17 refs.)

117229 **Distribution-free estimation of sphere size distributions from slabs showing overprotection and truncation, with a review of previous methods.** L.M.Cruz-Orive (Anatomical Inst., Univ. of Berne, Berne, Switzerland).
J. Microsc. (GB), vol.131, pt.3, p.265-90 (Sept. 1983).

A distribution-free method is presented for unfolding the size distribution of an aggregate of disjoint opaque spherical particles in a translucent medium, from the circular profiles observed in the orthogonal projection of sections of a certain thickness through the medium. This situation pertains especially to light and transmission electron microscopy. The model accounts for overprotection (or 'Holmes effect') due to section thickness, and for two forms of truncation (or 'missing profiles' mechanisms), simultaneously. The profile data may be grouped into an arbitrary class system, chosen by the user, and the procedure can be programmed in a medium-size desk calculator. In order to incorporate the above features, however, the authors had to choose a finite-difference unfolding algorithm, the advantages and disadvantages of which are discussed in the context of the main alternative unfolding procedures hitherto available. The performance of the method is tested against three sets of real data previously analysed by a maximum likelihood method (Keiding et al., 1972). (61 refs.)

117230 **Spindle stage studies on HMX and AP.** J.A.Kohlbeck (Hercules Inc., Aerospace Div. Magna, UT, USA).
Microscope (USA), vol.30, no.4, p.249-57 (Fall 1982). [received: Sept. 1983]

Demonstrates the application of the spindle stage technique described by Bloss (1981) of measuring the optical orientation of crystals with respect to wavelength of light. These measurements were made on the polymorphs of HMX for three different wavelengths. The other example for Excalibr's use was ammonium perchlorate (AP). The spindle stage is a versatile accessory for the polarizing microscope which enables optical constants to be measured on crystalline material with good accuracy. This method is of particular advantage where only fragments of crystalline material may be available for analysis or when it is necessary to measure inclusions in crystals. (4 refs.)

117231 **Particle characterization by PLM. II. Single polar.** W.C.McCrone (McCrone Res. Inst., Chicago, IL, UISA).
Microscope (USA), vol.30, no.4, p.315-3 (Fall 1982). [received: Sept. 1983]

For pt.I, see ibid. vol.30, no.3, p.185 (1982). Use of a single polar permits the observation of pleochronism rather than average color and individual refractive indices rather than an average index. It is essential that the vibration direction of the polar be known and accurately oriented with (usually) the East-West crossline. All of the various operations using dispersion straining then become possible. These include measurement of the matching wavelength as a function of crystallographic direction, quick determination of relative index or particle and liquid and measurement of n_F, n_D and n_c for each index direction. (no refs.)

117232 **Studies on optical properties of confocal scanning optical microscope using pupils with radial transmission ρ^n distribution.** A.M.Hamed, J.J.Clair (Ecole Nat. Superieure de l'Electronique et de ses Applications, Cergy, France).
Optik (Germany), vol.65, no.3, p.209-18 (1983).

The coherent Point Spread Function (PSF) of a parabolic variant radius of amplitude pupil has been calculated for a Confocal Scanning Optical Microscope (CSOM). A general formula, in polar coordinates (ρ,θ), is given to evaluate the coherent PSF (amplitude transmission has ρ^n distribution, where n is an even number). Also, the coherent PSF of phase aberrated pupils with parabolic amplitude and phase variations in the case of CSOM, has been calculated. Results are presented for both circular phase pupils and linear amplitude phase pupils. The results of calculations, for amplitude pupils and phase aberrated pupils, are shown graphically and a comparison is made between the authors' results and the results for uniform circular and annular pupils. 07.62 DETECTION OF RADIATION (BOLOMETERS, PHOTOELECTRIC CELLS, I.R. AND SUBMILLIMETRE WAVES DETECTION)

117233 **Spectral responsivity standard for infrared detectors.** L.J.Cox (Optical Systems Dept., Sira Ltd., Chislehurst, England), P.J.Key.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.46-50 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).

A preliminary report is given on the implementation of a UK National Standard for the relative spectral responsivity of infrared detectors. This will overlap with existing NPL absolute spectral responsivity standards for the visible and near infrared and will cover the spectral range from 1 to 30 micrometres with a target accuracy in the primary standard of ±1% at wavelengths up to 18 micrometres and ±2% at longer wavelengths. (5 refs.)

117234 **Infrared detector update.** M.McCormick.
Electro-Opt. (USA), vol.15, no.6, p.62-9 (June 1983).

Compares specific detectivity curves, clarifies detection parameters and lists manufacturers for infrared detectors that cover the spectral region from 1 μm out to 5 mm. (3 refs.)

117235 **The Reststrahlen phenomenon and liquid helium cooled far infrared crystal detector.** H.P.Bhattacharya (Solid State Phys. Lab., Delhi, India).
Indian J. Cryog., vol.8, no.2, p.95-6 (1983).

When ionic crystals like the alkali halides are made to vibrate in the infra-red (actually in the far infra-red region) under the action of an electromagnetic field giving optical lattice vibrations, there is strong reflection of the EM waves near the resonant frequency and this phenomenon is known as the Reststrahlen effect. This originates in the dispersion, i.e. the change of refractive index with frequency, and shows up near the resonant frequency of the ionic lattice in the region of anomalous dispersion. Through the multiple reflection by mirrors of suitable ionic material the resulting radiation after many reflections can become nearly monochromatic. Beside this customary use of the Reststrahlen effect, the phenomenon can also be used in evaluating ionic type materials like the $Hg_{1-x}Cd_xTe$ (mercury cadmium telluride) by their typical Reststrahlen bands. The above type of ternary materials have great use to-day as infra-red sensitive material in the wave length range from 2 microns to 14 microns. The Reststrahlen bands of these materials will fail in the far infra-red region where suitable crystal detectors operating at liquid helium temperatures form the most sensitive detecting devices. 07.65 OPTICAL SPECTROSCOPY AND SPECTROMETERS

(inc. photoacoustic spectroscopy)

117236 **A new background-correction method for atomic absorption spectrometry.** S.B.Smith,Jr., G.M.Hieftje (Instrumentation Lab. Inc., Wilmington, MA, USA).
Appl. Spectrosc. (USA), vol.37, no.5, p.419-24 (Sept.-Oct. 1983).

A new method is described and tested for background correction in atomic absorption spectrometry. Applicable to flame or furnace atomizers, the method is capable of correcting backgrounds caused by molecular absorption, particulate scattering and atomic-line overlap, even up to an absorbance value of 3. Like the Zeeman approach, the new method applies its correction very near the atomic line of interest, can employ single-beam optics, and requires no auxiliary source. However, no ancillary magnet or other costly peripherals are required and working curves are single-valued. The new technique is based on the broadening which occurs in a hollow-cathode spectral line when the lamp is operated at high currents. Under such conditions, the absorbance measured for a narrow (atomic) line is low, whereas the apparent absorbance caused by a broadband background contributor remains as high as when the lamp is operated at conventional current levels. Backgound correction can therefore be effected by taking the difference in absorbances measured with the lamp operated at high and low currents. The new technique is evaluated in its ability to correct several different kinds of background interference and is critically compared with competitive methods. (10 refs.)

117237 **Determination near the limit of detection with a sequential scanning inductively coupled plasma emission spectrometer.** D.D.Nygaard, D.S.Chase, D.A.Leighty (Instrumentation Lab. Inc., Analytical Instrument Div., Andover, ME, USA).
Appl. Spectrosc. (USA), vol.37, no.5, p.432-5 (Sept.-Oct. 1983).

Requirements associated with determinations near the limit of detection by sequential scanning inductively coupled plasma emission spectrometry are discussed. Strategies are suggested for overcoming potential difficulties, and analytical results generated using these strategies are presented for EPA Water Pollution Quality Control Samples. (6 refs.)

117238 **A design of Raman spectrograph for optical activity and normal Raman measurements.** P.L.Polavarapu (Dept. of Chem., Vanderbilt Univ., Nashville, TN, USA).
Appl. Spectrosc. (USA), vol.37, no.5, p.447-9 (Sept.-Oct. 1983).

A multipurpose Raman spectrograph employing a diode array detector and optics for collecting scattered light in two orthogonal scattering planes is described. Raman spectra representing the performance of the instrument are presented. (12 refs.)

117239 **Convective effects in thermal lens spectroscopy.** C.E.Buffett, M.D.Morris (Dept. of Chem., Univ. of Michigan, Ann Arbor, MI, USA).
Appl. Spectrosc. (USA), vol.37, no.5, p.455-8 (Sept.-Oct. 1983).

Thermally induced solution stirring can cause periodic signal fluctuations which can be the sensitivity limiting factor in thermal lens spectroscopy with a chopped pump laser. Pump and probe laser fluctuations are random, while thermal lens signals have a small periodic component caused by stirring. The problem is serious in dilute solutions because of the high solvent background absorbance. (12 refs.)

117240 Continued development of direct aerosol introduction in constant temperature furnace atomic absorption spectroscopy. D.R.Jenke, R.Woodriff (Dept. of Chem., Montanna State Univ., Bozeman, MT, USA).

Appl. Spectrosc. (USA), vol.37, no.5, p.470-2 (Sept.-Oct. 1983).

In a previous article (1983), the authors described the combination of a sample introduction/desolvation system with a Woodriff type constant temperature furnace atomizer. While the performance of the system for the determination of Ag, Cd, Zn, and Pb was characterized by a high sensitivity and reproducibility, utilization of the system described was limited to the determination of easily atomized species due to the relatively low temperatures attainable with the particular furance employed; also useful lifetime of the graphite furnace components was limited by the desolvator's inability to completely scavenge oxidizing components from the sample. Minor modifications in furnace design allow the analyst to increase the maximum operating temperature, thus expanding the applicability of the particular design while changes in the condenser design significantly increases the desolvation scavenging ability. The performance, in terms of sensitivity, reproducibility, accuracy, and freedom from simple acid matrix interferences, of this system in the analysis of aqueous samples of Ag, As, Al, Cd, Cr, Cu, Fe, Hg, Mn, Ni, Pb, Se, and Zn is documented. (4 refs.)

117241 Measurement of frequency shifts using infrared or Raman difference spectroscopy. J.Laane (Dept. of Chem., Texas A&M Univ., College Station, TX, USA).

Appl. Spectrosc. (USA), vol.37, no.5, p.a474-5 (Sept.-Oct. 1983).

The author recently developed a comprehensive picture of the difference spectra expected from the use of Raman difference spectroscopy (RDS). Both frequency shifts and bandwidth changes contribute to the nature of such spectra. The RDS theory is also immediately applicable to analyzing infrared absorption bands; however, no experimental results have been presented. One reason for this is that it is inherently more difficult to obtain useful information on frequency shifts and bandwidth changes from infrared difference spectra due to the limitations on infrared absorbances. This is, it is generally impractical to work with infrared bands whose absorbances considerably exceed about 1.0 absorbance unit (less than 10% transmittance), whereas for RDS large intensities are desirable for RDS measurements. Since many strong infrared bands go 'off-scale' for pure liquids in even short path length cells, it is not practical to use infrared difference techniques to measure solvent shifts relative to the pure liquid for many samples. However, frequency differences between dilute solutions may be measured. (9 refs.)

117242 Reducing radio-frequency interference effects on emission spectrometer outputs. W.R.Kennedy (American Cast Iron Pipe Co., Birmingham, AL, USA).

Appl. Spectrosc. (USA), vol.37, no.5, p.478-9 (Sept.-Oct. 1983).

Spark excitation, and especially high voltage spark excitation, creates radio-frequency waves of sufficient intensity to cause malfunctions in nearby computers and digital readouts. The author found a simple solution to be floor-to-ceiling portable screen wire frames. These screens are electrically connected together and grounded to the equipment. They can be moved between spectrometer and readout or between spectrometer and spectrometer as the situation demands. (1 ref.)

117243 An introduction to inductively coupled plasma source mass spectrometry. A.R.Date (Inst. of Geological Sci., London, England).

TRAC Trends Anal. Chem. (Netherlands), vol.2, no.10, p.225-30 (Oct. 1983).

Inductively coupled plasma (ICP) source mass spectrometry is a revolutionary new method of analysis, combining the speed and convenience of sample introduction into the ICP with the high sensitivity and isotope ratio capability of atomic mass spectrometry. (16 refs.)

117244 New analysis methods in photon correlation spectroscopy. P.J.Nash, T.A.King (Phys. Dept., Univ. of Manchester, Manchester, England).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.622-31 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).

Describes the analysis of photon correlation spectroscopy decay curves by a significant new method based on the fitting of sums of positive exponentials by the S-exponential sum fitting method. The method fits a positive exponential sum to a given data set providing a best weighted least squares fit. No initial setting of any of the parameters is required and the number of exponential coefficients does not have to be preset in the program but is determined by the number of components apparent above the noise level. Results are discussed for application in scattering systems which may be single or multiple component. Systems generating single, double or multiple exponential decay functions derived from computer simulation or photon correlation experiments are considered and fitting analysis with varying noise levels. (11 refs.)

117245 New grating spectrometer with increased throughput. R.Damaschini (Lab. Aime Cotton, CNRS, Orsay, France).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.662-5 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).

The set-up consists of a double-grating system which realises 2 successive auto-correlations of a grille, that is to say a two-dimensional repartition of opaque and transparent zones. The flux transmission of this set-up is identical to the classical slit spectrometer but the equivalent slit height can be up to one meter for a 1 meter focal length objective. In contrast to a one-grating grille spectrometer previously proposed, no important background substraction by demodulation is needed. This system is therefore capable of operating in spectral ranges where gratings are usually used. (2 refs.)

117246 A new method of grating spectroscopy. K.Yoshihara, A.Kitade, M.Tazawa (Dept. of Appl. Phys., Nagoya Univ., Nagoya, Japan).

Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L400-2 (July 1983).

A new spectroscopic method is described which enables a radiation spectrum to be reconstructed by simultaneously measuring the intensity distribution of the Fraunhofer diffraction pattern produced by a single slit or a number of slits without separating different and overlapping orders. Computer experiments have verified the validity of the method, although ideal resolution has not yet been achieved. (1 ref.)

117247 Laser-piezoelectric-photoacoustic observation of the electrode surface. T.Sawada, A.J.Bard (Dept. of Chem., Univ. of Texas, Austin, TX, USA).

J. Photoacoust. (USA), vol.1, no.3, p.317-27 (1982-1983). [received: Oct. 1983]

Preliminary spectrometric investigations of the electrode-solution interface by pulsed dye laser-piezoelectric transduced (PZT) photoacoustic spectroscopy (PAS) are described. The deposition of the radical cation bromide ($HV^{+}\cdot Br^{-}$) formed on reduction of heptylviologen in aqueous solutions on a Pt electrode attached to a PZT was monitored and less than monolayer coverages of $HV^{+}\cdot Br^{-}$ could be detected ($S/N=1$) . The apparatus for PZT-PAS and the nature of the PAS response upon pulsed laser excitation are described. (11 refs.)

117248 Conception and realization of a photoacoustic detector for in situ spectroscopy. P.Poulet, J.Chambron (Faculte de Medicine, Inst. de Phys. Biologique, Strasbourg, France).

J. Photoacoust. (USA), vol.1, no.3, p.329-46 (1982-1983). [received: Oct. 1983]

A photoacoustic spectrometer using an open-ended detector has been developed for doing in situ measurements. It makes use of a UV light guide and a differential microphone assembled in between two identical cells, one illuminated and the other not. The characteristics of this detector are expressed in terms of sensitivity to noise ratio. The obtained results enable one to perform original applications of photoacoustic spectroscopy, especially in vivo measurements of skin optical absorption. (19 refs.)

117249 Multiplex detection in a combined laser optoacoustic spectrometer-chromatograph. V.P.Zharov (Dept. of Optoelectronics, Moscow High Tech. School., Moscow, USSR), S.G.Montanari.

J. Photoacoust. (USA), vol.1, no.3, p.355-64 (1982-1983). [received: Oct. 1983]

A multiplex scheme of detection in the laser optoacoustic spectrometer designed as a selective chromatographic detector is described. The principle of multiplex detection and its specific features are presented. The measuring setup developed utilizes three spectral channels with He-Ne, $^{12}C^{16}O_2$ and $^{13}C^{16}O_2$ lasers. The potentialities of the scheme are demonstrated by selective detection of certain alcohols in a mixture of four alcohols. Areas of application of the scheme are proposed and several modifications are discussed. (4 refs.)

117250 Separation of bulk and surface light absorption with an open photoacoustic cell. P.Helander, I.Lundstrom (Dept. of Phys. & Measurement Technol., Linkoping Inst. of Technol., Linkoping, Sweden).

J. Appl. Phys. (USA), vol.54, no.9, p.5069-75 (Sept. 1983).

A spectroscopic method for the study of adsorption of molecules onto a solid is demonstrated. It is shown in particular how the spectra of molecules adsorbed onto a solid surface and molecules in a solution outside the surface can be recorded simultaneously. The method is based on the information present in the phase of a photoacoustic signal. The experiments made to demonstrate this method were performed with an open photoacoustic cell. In this cell the temperature oscillations in the sample are transferred to a window. The thermal expansions of the window are detected by a piezoelectric crystal. Light absorbing molecules on the surface of the window and in the bulk liquid give signals with different phases that can be separated by phase sensitive detection. (20 refs.)

117251 Effect of axial injection of argon on conventional spectrochemical excitation sources at atmospheric pressure. I. Behavior of line intensities and their profiles under various experimental conditions. L.Pasky (Lenin Metall. Works, Miskolc, Hungary), I.J.Lakatos.

Spectrochim. Acta Part B (GB), vol.38B, no.8, p.1099-14 (1983).

The axial injection of argon into the conventional excitation sources through a hole drilled in the upper electrode is discussed. In spite of a simple electrode arrangement the argon produces unexpected and significant changes in emission phenomena. Self-reversal is practically eliminated. Intensity enhancements were studied as a function of line character, excitation potential, electrode type, concentration of analytes and concomitants, the presence of organic materials (solvents and solutes) and the purity of the argon. The intensity enhancement deteriorated if the concentration of excitable particles (atoms, molecules, free-radicals, etc). in the plasma increased. Using krypton instead of argon similar results were obtained. (38 refs.)

117252 Nonmetal excitation in helium, neon, and argon microwave plasmas. C.F.Bauer (Dept. of Chem., Univ. of New Hampshire, Durham, NH, USA), R.K.Skogerboe.

Spectrochim. Acta Part B (GB), vol.38B, no.8, p.1125-34 (1983).

Determines which nonmetal emission wavelengths are excited in microwave induced plasmas operated in argon, helium, and neon. Evaluation of the excitation energies associated with the nonmetal wavelengths observed relative to the energies of the rare gas metastable species which may be present in each instance indicates that collisional excitation by the rare gas molecule in the triplet state is most consistent with the data. Although this conclusion is the same as that proposed by Beenakker (ibid., vol.328, p.173, 1977) a detailed consideration shows that other excitation mechanisms may contribute to the observed spectra. (51 refs.)

117253 The capacitatively coupled microwave plasma (CMP) as atomisation source in atomic absorption spectral analysis. G.Wunsch, G.Hegenberg, N.Czech (Anorganisch-Chem. Inst., Univ. Munster, Munster, Germany).

Spectrochim. Acta Part B (GB), vol.38B, no.8, p.1135-41 (1983). In German.

The capacitatively coupled microwave plasma (CMP) with N_2 as working gas is suitable as an atomizer for atomic absorption spectroscopy. The sensitivities for Ba, Ca, Co, Cr, Fe, Mg, Mo, Ni, Sr, W and Zn are given. Their relative position in this sequence reflects the differences in the dissociation energies of the monoxides. The type of CMP used has an excitation temperature of 5600 to 4750K and a kinetic temperature of 4450K. Referring to equal optical path lengths the sensitivity in the CMP (and also in the ICP) is not better than in the 1500K 'cooler' reducing acetylene flames. A high kinetic temperature alone is not sufficient; better degrees of atomization will only be achieved if plasmas with much higher analyte residence time or with reducing chemical properties can be developed. (29 refs.)

117254 Separative column atomizer (SCA) for direct analysis by atomic absorption spectrometry. GC separation characteristics. M.Yanagisawa, H.Suzuki, K.Kitagawa, S.Tsuge (Dept. of Synthetic Chem., Nagoya Univ., Nagoya, Japan).

Spectrochim. Acta Part B (GB), vol.38B, no.8, p.1143-9 (1983).

An improved separative column atomizer (SCA) usable at higher temperatures up to 1350°C has been constructed. Emphasis is on the GC characteristics of an improved separative column atomizer (SCA) module to reduce the interferences caused by background absorption that is often unavoidable in direct analysis of practical samples. By direct ASS analysis, mercury in some organic samples has been successfully determined without background absorption due to nonatomic species resulting from the sample matrices. In the direct atomization of samples in ECTA matrix, however, complete elimination of the background absorption was not possible. Nevertheless, GC separation found in the improved SCA was effective in the measurement of the AA peak free from molecular absorption. Evidences of the GC separation were also given by the analysis of effluent gases. (10 refs.)

117255 Determination of absolute atomic concentration by the saturated vapour total absorption method. V.G.Muradov (Dept. of General Phys., Teaching Inst., Ulyanovsk, USSR).
Spectrochim. Acta Part B (GB), vol.38B, no.8, p.1151-6 (1983).
Presents a general method for determining the absolute atomic concentration in saturated vapour by means of the total absorption method. The method is based on the total growth curve and involves a correction for hyperfine structure of the spectra line and its wings. The method is applied to the resonance line of Pb(I) $\lambda=283.3$ nm, for which the growth curves for both lead of natural isotropic composition and enriched by ^{208}Pb (97.8%) have been calculated. Theoretical curves are used to determine absolute concentrations of led atoms in saturated vapour over the temperature interval 783-1113K. The experimental results are reasonably consistent with the data obtained in terms of Pb thermodynamic characteristics. (16 refs.)

117256 JSY-390 laser light scattering spectrometer. Yang Bingxin, Yang Qinglin, Zhang Haoyu, Sun Chunrong (Changchun Inst. of Appl. Chem., Acad. Sinica, Jilin, China).
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.183-98
The design of an optomechanical system and data collection and processing system of the JSY-390 laser light scattering spectrometer are described and discussed. Multifunction and multisignal reception are the main features. Angular resolution is 0.016° and the lowest measurable angle is 0.4°. A time resolution of 25 milliseconds is available. Data collection, translation and calculation are performed by a microcomputer. The specification of this instrument has been verified by the use of it in studying the structure of some crystalline polymers. (13 refs.)

117257 A file search system for infrared spectra. K.Tanabe, T.Tamura, J.Hiraishi, S.Saeki (Nat. Chem. Lab. for Industry, Tsukuba, Ibaraki, Japan), I.Suzuki, M.Tasumi.
J. Spectrosc. Soc. Jpn. (Japan), vol.32, no.4, p.241-8 (1983). In Japanese.
The search file has been created from the original data file which was constructed by compiling peak wavenumbers and transmittances in the IRDC cards. Input data of peaks and no-peak areas from a sample spectrum are compared with the file data, and a score measuring an extent of coincidence of sample and file spectra is computed for a hit spectrum in the file. Observed spectra of fifty compounds were used for a test search in order to find out a maximal condition of a search system. It is proved that the present search system has a high performance for a practical purpose. (10 refs.)

117258 Picosecond double-beam absorption spectrometer. A.V.Klevanik, V.A.Shuvalov, Yu.A.Matveets, A.V.Sharkov (Inst. of Photosynthesis, Acad. of Sci., Pushchino, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.401-3 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.655-8 (March 1983). [received: Oct. 1983]
Apparatus was constructed for investigating fast photophysical and photochemical processes resulting from selective excitation of vibronic molecular states. A single laser pulse emitted from a YAG:Nd mode-locked laser was amplified in a two-stage amplifier, frequency converted in a parametric oscillator and used to excite molecules. A pulse of the continuum was used as the test pulse. A time resolution of ±3 psec and a precision of $\pm3\times10^{-3}$ optical density units were attained in the absorption measurements carried out in a study of primary processes of conversion of the energy of light in photosynthetic reaction centers. 07.68 PHOTOGRAPHY, PHOTOGRAPHIC INSTRUMENTS AND TECHNIQUES

(for light sensitive materials see also 42.70)

117259 Autoradiography: a review of basic principles. E.J.Hahn (Health Sci. Markets Div., Eastman Kodak Co., Rochester, NY, USA).
Am. Lab. (USA), vol.15, no.7, p.64-71 (July 1983).
Autoradiography is a photographic method of recording the spatial distribution of radioisotopes within a specimen or object. Autoradiographs are accomplished by placing radioactively labeled specimens and objects in direct contact with the proper photosensitive materials. The principles of micro- and macro-techniques are outlined and the following topics are discussed in some detail: formation of autoradiographic images; choosing an exposure method for macroautoradiography; film considerations; manual and machine processing; enhancement techniques; and X-ray films recommendations. (no refs.)

117260 Fujicolor HR 100—a review. G.Ashton.
Br. J. Photogr. (GB), vol.130, no.30, p.787-9 (29 July 1983).
As the first of a new generation of medium-speed, fine-grain colour negative materials Fujicolor HR 100 film is an excellent product and one which can give even the amateur photographer who is content with $3^1/_2\times5$ in prints perceptibly superior results. As the manufacturer claims, prints, even small ones, made from Fujicolor HR 100 negatives are not only sharp and grainless but also of excellent colour quality. For more critical users who need, or prefer, to make bigger prints the superiority of the film over the existing products will be more obvious—large prints can be made from 35 mm negatives on Fujicolor HR 100 film without breakdown of the image or loss of resolution. The characteristics stem from three basic manufacturing improvements, double structure grains, latex-formulated coupler particles and improved development inhibitor releasing couplers. (no refs.)

117261 High-speed photography. J.E.Field (Cavendish Lab., Univ. of Cambridge, Cambridge, England).
Contemp. Phys. (GB), vol.24, no.5, p.439-59 (Sept.-Oct. 1983).
High-speed photography has the great advantage of giving direct visual information about transient processes. For this reason, it is finding increasing application for solving a range of industrial and scientific problems. The author reviews the techniques of high-speed photography and describes a range of applications. There are various types of high-speed camera which can operate in different speed, or framing rate, ranges. These are discussed in terms of increasing framing rate in frames per second (FPS) which illustrates the techniques and also the historical development of the subject. The applications illustrated include studies of fracture, impact, erosion, explosive initiation and laser-induced damage. (25 refs.)

117262 The all-electronic Mavica [magnetic video camera]. M.Stern.
Radio-Electron. (USA), vol.54, no.8, p.59-62,78 (Aug. 1983).
Discusses the development of a photographic system that does away with film completely. Mavica (magnetic video camera) combines electronics and electromagnetic technology into a non-silver-based photographic system. This Sony camera uses a Mavipak recording disk to store pictures. The Mavica acts much like a video recording system and uses a CCD for image conversion. The final part of the basic Mavica system is the playback unit, which converts the signals recorded on the disk into a picture that can be viewed on a TV receiver. A thermal colour video printer was also developed which is capable of taking the colour output signals of the Mavica and turning them into colour prints. (no refs.)

117263 The new disc cameras. M.Stern.
Radio-Electron. (USA), vol.54, no.8, p.63-6 (Aug. 1983).
Examines Kodak's disc cameras. There are four models available—the 3000, 4000, 6000 and 8000. Each model has a four-element, f/2.8, 12.5-mm, fixed focus lens, and two automatic exposure settings. The flash is built in and operates automatically when needed. The features of the various models are given. The major portion of the disc camera's electronics is contained in two custom ICs, the light sensing IC and the control IC. (no refs.)

117264 Auto exposure and auto focus systems. M.Stern.
Radio-Electron. (USA), vol.54, no.8, p.67-74 (Aug. 1983).
The author examines these systems which use LSI technology to combine many control functions on a single IC. One example of the state of the art in 35 mm photography is the Minolta X-700 system. It offers about every feature currently available and consists of the camera itself, an autoflash, a motor drive, a multifunction back, and a wireless remote control. Autofocus systems can be grouped into two classifications: active and passive. As an example of an active system Polaroid's 600 which uses a sonar system is included. (no refs.)

117265 Photo accessories. M.Stern.
Radio-Electron. (USA), vol.54, no.8, p.75-8 (Aug. 1983).
Reviews some photo accessories such as strobe units, light meters and spotmeters. 'Smart' strobes are available which can communicate with 'intelligent' cameras to produce high quality photos. An example of a dedicated electronic flash is the Speedlight 166A from Cannon. Built-in microcomputers and LCD readouts are some of the features available in light meters. Monolta's Spotmeter M uses microprocessor control and LCD readout, which allows the photographer to measure the lighting on an exact spot. (no refs.)

117266 Electronics in the darkroom. M.Stern.
Radio-Electron. (USA), vol.54, no.8, p.79-82 (Aug. 1983).
Discusses some of the ways in which electronics has made colour printing easier. One of the most critical factors in colour processing is the temperature of the chemicals used. To measure temperature accurately, an electronic digital thermometer like the Omega CF-20 can be used. Colour analyzers such as the microprocessor-controlled SCA 300 which can accept computer-type RAM programmable memory-modules allow the photographer to make a number of prints without having to retest, reset or reprogram anything. With the correct exposure and timing information the photographer can then program an all-electronic darkroom timer to turn on the enlarger for the correct length of time. (no refs.)

117267 The 'Kinor 16R' 16 mm hand-held film camera. E.N.Borisov, E.G.Bychko, V.F.Gordeev.
Tekh. Kino & Telev. (USSR), no.7, p.21-2 (July 1983). In Russian.
Some design features of the new Kinor 16R film camera are considered and its basic technical parameters are given. (2 refs.)

117268 A method for silver analysis of waste fixing solutions. I.Yu.Dynin, A.E.Kachanovskii, K.V.Orlov, A.P.Skakun.
Tekh. Kino & Telev. (USSR), no.7, p.27-8 (July 1983). In Russian.
Considers an improved method for quantitative determination of silver in waste fixing solutions characterised by shorter analysis time, lower consumption of chemical agents, and lower gassing while maintaining high determination accuracy. The new method differs from the previous one in that filtering of silver sulphide sediment is replaced by centrifugation. (3 refs.)

117269 The 'KOC-2' lamp for special types of film shooting. N.V.Alfimova, L.N.Krivoshi, A.M.Kuritsyn, I.N.Oskolkov, Yu.P.Pokhitonov.
Tekh. Kino & Telev. (USSR), no.7, p.29-31 (July 1983). In Russian.
The necessity of developing the lighting equipment intended for special types of film shooting is discussed, in particular for macrophotography, slow and speed motion shooting. A new lamp designed for special types of shooting is considered. (4 refs.)

117270 The effect of the emulsion layer structure on their sensitometric and structuremetric characteristics. V.V.Andreyanov, Yu.G.Oranskii.
Tekh. Kino & Telev. (USSR), no.7, p.32-6 (July 1983). In Russian.
Considers the sensitometric properties of two-layer samples and the reversal color image granularity versus the composition and structure of the emulsion

semi-layers and the concentration of color developing couplers. An attempt has been made to determine the optimum structure of zonal emulsion layers. (32 refs.)

117271 Determination of the optimum degree of color image two-dimensional contouring. O.V.Gofizen, G.K.Kupriyanova, M.D.Ruvinskii.
Tekh. Kino & Telev. (USSR), no.7, p.49-52 (July 1983). In Russian.
Experimental data of 12000 expert assessments was obtained to reveal the relationship between color image quality and a two-dimensiosal contouring degree in close-up, medium and long shots. It is shown that contouring results in a 0.7-1.1 grade increase in subjective quality assessment. (2 refs.)

07.75 MASS SPECTROMETERS AND MASS SPECTROMETRY TECHNIQUES

(for mass spectroscopic chemical analysis, see 82.80)

117272 Investigation of a magnetron mass-spectrometer. O.S.Kuzema, G.A.Bakai.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.9, p.52-5 (1983). In Ukrainian.
The mode of operation and main characteristics of the dynamic magnetron mass-spectrometer are described. The mass spectrometer has no geometric aberrations and permits an ionic source with 360° angular beam divergence to be used. The peculiarities mentioned provided an increase in resolution and sensitivity of the mass spectrometer. (5 refs.)

117273 Interfacing a transit-time mass spectrometer to a minicomputer. F.Ya.Gimel'shein, V.A.Ermolenko, A.N.Mikheev (Organic Chem. Inst., Acad. of Sci., Novosibirsk, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.5, pt.1, p.1115-18 (Sept.-Oct. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.5, p.69-72 (Sept.-Oct. 1982). [received: Sept. 1983]
A circuit is described for interfacing the MSKh-4 transit-time mass spectrometer to the 'Elektronika-100I' minicomputer, which permits recording of individual segments and intensities of selected mass-spectrum peaks. Six recording channels are provided, with delay time in each channel adjustable over the range 6-42 μsec. Information input into the computer is in the form of 12-bit-wide binary code. (4 refs.)

117274 Mass spectrometry of negative ions. A practical application. H.Budzikiewicz (Inst. fur Organische Chem., Univ. zu Koln, Koln, Germany).
Izv. Khim. Bulg. Akad. Nauk. (Bulgaria), vol.15, no.4, p.482-93 (1982). [received: Sept. 1983]
While mass spectrometry of positive ions has its well-established place in a modern analytical laboratory, the true value of negative ions has become evident only during the last few years, when ion sources for so-called chemical ionization become commercially available. The reason for this will become evident from a discussion of the differences between positive and negative ionization. (19 refs.)

117275 High resolution scanning secondary ion mass spectrometry (SIMS) using liquid metal field-ionization sources. A.R.Bayly, A.R.Waugh, K.Anderson (VG Sci. Ltd., East Grinstead, England).
Scanning Electron Microsc. (USA), pt.1, p.23-9 (1983). (Scanning Electron Microscopy 1983 Conference, Dearborn, MI, USA, 17-22 April 1983).
SIMS microanalysis is readily achieved by the adoption of the liquid metal field ion source for formation of the primary ion probe. These sources exhibit high brightness and small source size and permit the formation of high intensity sub-micron ion beams at low energies (≤10 keV). Operation is simple, UHV compatible and well suited to multi-technique surface analysis systems, as well as dedicated SIMS instrumentation. A 10kV gallium microprobe has been evaluated on a UHV SIMS instrument. The results presented demonstrate spatial resolution in secondary electron and secondary ion images close to 0.1 micron. A variety of samples including insulators, fractures, catalysts, polymers and integrated circuit structures have been chosen. (6 refs.)

117276 Some aspects of high speed mass spectrometric signal processing. O.S.Constandse, P.J.W.Schuyl, J.H.van den Hende (Dept. of Chem. & Chem. Engng., Delft Univ. of Technol., Delft, Netherlands).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.505-14 vol.3
Various aspects of high speed mass spectrometric signal processing are evaluated and designs are presented of both an amplifier-ADC unit and a special purpose data processing unit. The units are developed to operate as a part of a modern hierarchical gas chromatograph/mass spectrometer/computer system. The GC/MS instrument calls for data sampling frequencies up to 400000 Hz for long periods of time (up to 2 hours). By using modern hardware technologies (very fast 12 and 16-bit ADCs, bit-slice architecture) and data processing concepts (distributed processing), the high speed and capacity demands were met. (6 refs.)

07.77 PARTICLE BEAM PRODUCTION AND HANDLING; TARGETS

(see also 29.25 in elementary-particle and nuclear physics, 41.80 Particle beams and particle optics)

117277 An aluminum liquid metal ion source with prolonged lifetime using a sintered boride emitter. Y.Torii, H.Yamada (Atsugi Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Atsugi-shi, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L444-6 (July 1983).
A field-emission liquid Al ion source with a sintered boride emitter, such as TiB_2, BN-TiB_2 composite, has been built to prolong the utilization term of an aluminum ion beam emission. In this approach, a stable Al ion beam emission was successfully obtained for more than 100 hours without any recognizable degradation. Emission current fluctuation was less than ±1% over 1 hour for 10 μA source ion current without any feedback stabilization. Moreover, 20-30 μA/sr angular intensity at 5-10 μA source ion current, 17° emission half-angle at 10 μA source current, and a large source ion current of more than 1.5 mA were also observed. (6 refs.)

117278 A new high repetition rate shutter to obtain short molecular beam pulses. L.Wolterbeek, J.Hofstra, C.Nijhof (Dept. of Appl. Phys., Twente Univ. of Technol., Enschede, Netherlands).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1533-8 (1983).
This new shutter simply consists of a chopper wheel rotating a mere half-millimetre away from the skimmer-shaped diaphragm, which separates the source chamber from the flight tube. The repetition rate can be up to 10^4 pulses per s (width $\sim$60 μs), at an intensity of $\sim 10^{19}$ molecules/sr s, whereas existing designs yield $\sim 10^{22}$ molecules/sr s, but only at a rate of 1 pulse per 1-10 s. The design has two main advantages: since there is no gas valve, cumbersome electromechanical devices with large current pulses can be avoided. Second, one is now free to choose the nozzle parameters (e.g. p_0, T_0 and the throat diameter d_n). The beam parameters were determined by means of an electron impact detector featuring a high efficiency ionizer, thus improving the signal-to-noise ratio. (18 refs.)

117279 Beam-energy distribution measurements of liquid gallium field-ion sources. G.L.R.Mair, D.C.Grindrod, M.S.Mousa, R.V.Latham (Dept. of Phys., Univ. of Aston, Birmingham, England).
J. Phys. D (GB), vol.16, no.10, p.L209-13 (14 Oct. 1983).
Measurements are reported on the energy distribution of the ion beam produced by Ga liquid metal ion sources, for a range of emission currents, $i \sim 1$-50 μA. The full width at half-maximum (FWHM). $\Delta E_{1/2}$, of the energy distribution curves varies from $\sim$4.5-5 eV at $\sim$1 μA to $\sim$35 eV at 50 μA. Three regions can be detected in the $\Delta E_{1/2}$ versus i curve. In the first region, between $\sim$0.6 and 2 μA, $\Delta E_{1/2}$ varies very slowly with current. In the second region, above $\sim$2 μA and extending up to $\sim$25 μA, the curve rises steeply with current, in fairly good agreement with the predicted $\Delta E_{1/2} \propto i^{2/3}$ relation. For $i \gtrsim 25$ μA the curve deviates markedly from this relation, and tends to flatten. Although a tentative explanation for the deviation from theory at high currents may be given in terms of gross instabilities of the anode, the deviation at very low currents (where $\Delta E_{1/2}$ is almost constant with i) is not understood. (13 refs.)

07.80 ELECTRON AND ION MICROSCOPES AND TECHNIQUES

(see also in condensed matter 61.16D Electron microscopy, 61.16F Field ion microscopy)

117280 Applications of Auger spectroscopy. S.I.J.Ingrey (Bell-Northern Res., Ottawa, Ontario, Canada).
Can. J. Spectrosc. (Canada), vol.28, no.3, p.73-86 (1983).
Applications of Auger spectroscopy to resolve a wide range of materials problems has increased rapidly over the last five years. In particular, the microelectronics industry has come to rely heavily on this technique to characterize interfaces, where fractions of a monolayer of impurity may adversely effect processing or performance of integrated circuits. The Auger technique has also been successfully applied to many metallurgical problems. These two areas, among others, are reviewed along with a brief historical background, fundamentals of the technique and a few successful applications in the author's laboratories. (137 refs.)

117281 New high resolution electron spectrometer for surface vibrational analysis. L.L.Kesmodel (Dept. of Phys., Indiana Univ., Bloomington, IN, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1456-60 (1983).
The design and performance of a new electron spectrometer for high resolution electron energy loss (EELS) analysis of surface vibrations is described. Based on the 127° cylindrical deflection analyzer (CDA), the spectrometer incorporates a two-stage monochromator, a new lens system with out-of-plane focusing, relatively large (60 mm) energy-dispersing elements, and stringent magnetic field attenuation. Basic spectrometer geometry is compatible with commercial surface analysis systems employing Auger electron spectroscopy (AES), photoelectron spectroscopy (ESCA), low energy electron diffraction (LEED), etc. Performance of the instrument is shown to equal or exceed that of other spectrometers in terms of monochromatic current for a given energy resolution. An overall system resolution of 3.5 meV (28 cm^{-1}) FWHM is routinely achieved at 1.5×10^{-10} A incident current and high signal levels (10^5-10^7 cps) for elastic beam reflection. A higher resolution of 2.5 meV (20 cm^{-1}) has been obtained but with substantial sacrifice of signal level. Performance of the spectrometer is illustrated for the cases of direct (potential barrier) reflection from a palladium (100) crystal surface and for carbon-monoxide adsorption. (23 refs.)

117282 An in situ slow extension rate fracture stage for Auger electron spectroscopy. G.S.Was, H.H.Tischner, J.R.Martin (Dept. of Nuclear Engng., Univ. of Michigan, Ann Arbor, MI, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1477-9 (1983).
A fracture stage is designed to permit slow strain-rate tensile fracture of metallic samples inside the Auger vacuum chamber. The fracture stage consists of two crossheads, one fixed and one moveable. A small electric motor drives the moveable crosshead to separate from the fixed crosshead at a constant rate down to 7×10^{-4} cm/s. Samples remain attached to the sample carousel stage during load and following fracture, they can be quickly translated and rotated into alignment with the Auger analyzer. Tests on hydrogen charged Inconel 600 result in fracture times of 2-3 min and fracture strains of 4%-6% yielding a fracture surface that is in excess of 75% intergranular. This technique is recommended for grain boundary analysis of ductile austenitic alloys. (6 refs.)

117283 A stable, pure inert gas source for discharge lamps. G.B.Hoflund (Dept. of Chem. Engng., Univ. of Florida, Gainesville, FL, USA), R.P.Merrill.
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1560-2 (1983).
Discusses the use of the inert gas discharge lamp as a UV source for UPs. In particular a He flow system is described designed to give high purity He and stable operating pressures within the lamp. (3 refs.)

117284 Five-degrees-of-freedom stage for a scanning electron-beam microscope. G.Via (IBM Corp., Armonk, NY, USA).
IBM Tech. Disclosure Bull. (USA), vol.26, no.3A, p.1173-4 (Aug. 1983).
The objective of the stage is to enable the placement of a semiconductor wafer into a variety of orientations beneath the point of incidence of a scanning electron beam within a scanning electron-beam microscope chamber. (no refs.)

117285 Mobile detector for a scanning electron-beam microscope. G.Via (IBM Corp., Armonk, NY, USA).
IBM Tech. Disclosure Bull. (USA), vol.26, no.3A, p.1175-6 (Aug. 1983).
The structure of the detector-supporting mechanism is described. (no refs.)

117286 Fundamental theorem for type-1 magnetic contrast in the scanning electron microscope (SEM). O.C.Wells (IBM Thomas. J. Watson Res. Center, Yorktown Heights, NY, USA).
J. Microsc. (GB), vol.131, pt.3, p.RP5-6 (Sept. 1983).
The fringing field from a sample such as cobalt can be studied in the secondary electron (SE) image in the SEM by means of type-1 magnetic contrast, in which broad bands of bright or dark contrast are centered on the domain walls. This is because the SE are deflected by the fringing from the specimen. (6 refs.)

117287 A chemical thinning technique for transmission electron microscopy cross-sectional samples. R.J.Gaboriaud (California Inst. of Technol., Pasadena, CA, USA).
J. Electron. Mater. (USA), vol.12, no.5, p.837-44 (Sept. 1983).
An essentially chemical thinning method for cross-sectional electron microscopy samples is described. This method can give cross-sectional samples in less than three hours without ion milling. This technique has been applied to a silicon wafer that had been amorphized by ion implantation and then partially annealed. An amorphous silicon layer as thin as 200 Å was observed. (6 refs.)

117288 Using a microprocessor to analyse particle shape—a tutorial system. D.Fay (Computer Sci. Dept., Queen's Univ. of Belfast, Belfast, N Ireland).
Microprocess. & Microsyst. (GB), vol.7, no.7, p.300-5 (Sept. 1983).
Scientists of various disciplines are interested in particle morphology. The author describes some of the design decisions for a system using a low cost microprocessor and its associated equipment. The microprocessor (Apple II) collects images using a single-board TV scanner (Microworks Digisector) connected to an inexpensive security camera or to a scanning electron microscope. Interactive output is obtained from one TV monitor connected to the scanner and another connected to the microcomputer. A graph plotter (Hewlett-Packard 7225A) is used for hard-copy output. The programs are all written in UCSD PASCAL except for four short assembly language routines used for interfacing the TV scanner. The system is intended for tutorial purposes in computer science courses in addition to its prime application function. (4 refs.)

117289 Secondary electron and ion imaging in scanning ion microscopy. R.Levi-Setti (Enrico Fermi Inst. & Univ. of Chicago, Chicago, IL, USA).
Scanning Electron Microsc. (USA), pt.1, p.1-22 (1983). (Scanning Electron Microscopy 1983 Conference, Dearborn, MI, USA, 17-22 April 1983).
Ion beams extracted from liquid metal ion (LMI) sources can presently be focused to spot sizes 50-100 nm wide at currents of 10-100 pA-adequate to perform, among others, imaging functions in the scanning ion microscope (SIM). Good quality micrographs of conductors and insulators can be obtained using either the ion-induced secondary electron signal (ISE) or the secondary ion signal (ISI), at useful magnifications in the 200-4000 range. The large depth of field of the SIM ($\sim$1 mm) yields detailed ISE and ISI images of surface topography of three-dimensional objects. Evidence of pronounced Z-contrast effects have been obtained. Large crystallographic contrast, dependent on beam-target orientation, has been obtained. Large crystallographic contrast, dependent on beam-target orientation, has been observed in metals and semiconductors. This is attributed to the modulation of ISE and ISI emission by primary ion channelling effects. (67 refs.)

117290 Reproducibility of electron spectroscopy data with different analyzers. C.Le Gressus, O.Lee-Deacon (CENS, Gif-sur-Yvette, France), K.Yates, R.West.
Scanning Electron Microsc. (USA), pt.1, p.77-84 (1983). (Scanning Electron Microscopy 1983 Conference, Dearborn, MI, USA, 17-22 April 1983).
One of the important issues in electron spectroscopy is the reproducibility of data with different spectrometers. Differences in sample preparation, vacuum systems, and energy analyzers can lead to a dispersion in results. The authors compare the AES, ELS, and SES of clean aluminum samples obtained with two kinds of analyzer (CMA and HMA) and in different kinds of vacuum system. These spectra agree well with each other qualitatively; but quantitative discrepancies exist. The authors point out certain parameters to be included in the theories for quantitative data normalization in electron spectroscopy. (10 refs.)

117291 On the optimal parameters of a cylindrical mirror analyzer. Q.Wang, K.Lu, Z.Y.Hua (Modern Phys. Inst., Fudan Univ., Shanghai, China).
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.235-44
The influence of parameters on the angular aberration of a cylindrical mirror analyzer (CMA) used for electron spectrometers was digitally analyzed. It was found that the conventionally used parameters which satisfied the second-order focusing condition are not really optimized. A new method using the 'S-type aberration characteristics (SAC)' of the CMA has been proposed for minimizing the angular aberration. The optimal operation parameters were derived by numerical methods for various cases. Theoretical results showed that for a typical case the angular aberration corresponding to the optimal parameters obtained by the SAC method is only 25% of that obtained by the second-order focusing method. Since there is no limitation caused by the condition of the second-order focusing, the design of a CMA using the SAC method might have a much greater flexibility. (7 refs.)

07.85 X-RAY, GAMMA-RAY INSTRUMENTS AND TECHNIQUES

117292 Automation of the control of two physical experiments by M 7000 computer. P.Demel, J.Fafl, J.Mayrhoferova, J.Nadrchal, O.Smotlacha (Fyzikalni Ustav CSAV, Praha, Czechoslovakia).
Cesk. Cas. Fyz. Sekce A (Czechoslovakia), vol.33, no.4, p.373-9 (1983). In Czech.
Describes the implementation of automatic control of two devices: a spectrometer EXAFS and magnetic anisometer. The results are evaluated. (2 refs.)

117293 Crystals for synchrotron radiation experiments. J.Hrdy, E.Krousky, J.Traugott (Fyzikalni Ustav CSAV, Praha, Czechoslovakia), A.Zborilek, D.Mrazek, Z.Danicek.
Cesk. Cas. Fyz. Sekce A (Czechoslovakia), vol.33, no.4, p.380-2 (1983). In Czech.
The fabrication of silicon single crystals for a broad wavelength range X-ray spectrometer and monochromator suitable for synchrotron radiation experiments is described. (2 refs.)

117294 Flash X-ray cinematography at framing rates up to 4.10^7 images/sec: application to terminal ballistics. F.Jamet, F.Hatterer (Inst. Franco-Allemand de Recherches de Saint-Louis, Saint-Louis, France).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.164-7 (1983). (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).
Presents a novel tube including four flash X-ray sources equally spaced by 20 mm only so that parallax can be neglected in most cases. The electrodes consist of four cathodes and a single anode on which deflectors are mounted in order to prevent the vapors produced in a discharge space from attaining the other discharge spaces. The shortest time interval separating two successive discharges is only limited by the X-ray pulse duration, i.e. 25 ns. The novel flash X-ray tube is used in connection with four 500 kV, 60 J, Marx-surge generators. A dose of 1.94 μC/kg per pulse at 1 meter from the anode is reached. The frame recording method uses a fluorescent screen converting X-rays in light photons and a high speed electronic camera ('Imacon 790'). This new flash X-ray cinematographic device has been used for recording phenomena in terminal ballistics. Examples are given of frames showing the penetration of projectiles into a target. (3 refs.)

117295 Tomographic reconstruction from a limited number of projections. J.J.Lefebvre, J.Marilleau, T.Rousseau, P.Tremelat (CEA, Centre d'Etudes de Vaujours, Sevran, France).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.195-203 (1983). (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).
Studies the 3D reconstruction of simple objects from transmitted radiographs on the basis of computed tomography. A limited number of projections (about ten) is considered and a comparison given for different algorithms (convolution and algebraic reconstruction technique—ART). Results are presented for computed and experimental well known objects. (7 refs.)

117296 Processing system for radiographic pictures. P.Tremelat, J.J.Lefebvre, J.P.Aubry, P.Boutillier (CEA, Centre d'Etudes de Vaujours, Sevran, France).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.204-7 (1983). (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).
Radiographies of moving objects are affected by typical artefacts. The problems encountered in interpreting such pictures are described. Numerical and computing tools provided in order to solve these problems are presented. (2 refs.)

117297 Soft X-ray imaging microscopy using zone plates and nonsynchrotron sources. R.J.Rosser (Blackett Lab., Imperial Coll. London, London, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.711-15 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Considers the resolution of hydrated biological specimens by soft X-ray microscopy. This is set by damage to the specimen caused by secondary electrons and free radicals. Using synchrotron radiation the limit would be about 10 nm. By using short lived ($\sim$ 1 ns) sources as produced by a laser generated plasma, the Rayleigh limit of 2.3 nm should be possible. (11 refs.)

117298 Monolithic double-grooved-crystal monochromators with tunable harmonic suppression for neutrons and X-rays. U.Bonse, K.Olthoff-Munter, A.Rumpf (Inst. fur Phys., Univ. of Dortmund, Dortmund, Germany).
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.524-31 (1 Oct. 1983).
The principal methods of employing double-crystal reflection for harmonic rejection are briefly reviewed. The effect of using nonequal d spacings (dispersion) is considered. A new type of perfect-crystal monochromator consisting of a monolithic combination of a pair of grooved crystals a and b is described. The monochromaticity (degree of harmonic suppression) $M(\beta)$ is tuned by tilting groove a with respect to groove b by an appropriate angle β. The tilting is achieved in a simple way through a pair of helical springs. With three reflections in the first and two reflections in the second groove $M(\beta_0)$ values between 300 and 100 have been measured for X-rays at energies ranging from 6.72 to 9.86 keV and at a bandwidth $\Delta E/E \simeq 1.5\%$. β_0 is the tilting angle for which $M(\beta)$ is optimized. Once aligned the monochromator is a very simple unit, which can be mounted on any standard goniometer head and which can be used for both X-rays and thermal neutrons. (10 refs.)

117299 A focusing Weissenberg camera with multi-layer-line screens for macromolecular crystallography. N.Sakabe (Dept of Chem., Nagoya Univ., Nagoya, Japan).
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.542-7 (1 Oct. 1983).
A conventional Weissenberg camera (Weissenberg 1924) has been modified for macromolecular crystallography. This camera system consists of a doubly bent LiF monochromator, a newly designed Weissenberg goniometer with multi-layer-line screens and its controller. The camera is useful for recording many reflections up to high resolution on a film with high signal-to-background ratio from a crystal with large unit-cell dimensions without losing any of the diffracted beams by screens. The resulting photograph is very easy to index, and the ratio of partially recorded reflections to fully recorded reflections decreases in comparison with an oscillation camera. The multi-layer-line screens are especially practical with a continuous X-ray beam such as synchrotron radiation where both wavelength and band pass can be selected properly. The preparation of a point-focusing monochromator from a single crystal of LiF is described, and the recording of anomalous dispersion profiles is discussed. (5 refs.)

117300 A small-angle camera for resonant scattering experiments at the storage ring DORIS. H.B.Stuhrmann (Inst. fur Phys. Chem., Univ. Mainz, Mainz, Germany), A.Gabriel.
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.563-71 (1 Oct. 1983).
Resonant small-angle scattering is measured routinely in the wavelength range of 0.6 to 3.25 Å with the instrument X15 at the storage ring DORIS. The monochromatic beam with a vertical offset of 1.22 m is achieved by a double monochromator system with a constant exit slit. The small-angle instrument allows sample-detector distances between 0.37 and 7.33 m. A multiwire proportional counter with a sensitive area of 200×200 mm detects the scattered intensity with a spatial resolution of 2×2 mm. Its sensitivity can be adapted to the requirements of the experiment by activating a drift chamber of 8 cm depth at the back end of the detector. The performance of the instrument as a function of the wavelength is described. The energy resolution is about 1 eV at the L_3 absorption edge of caesium, as shown by the resonant scattering of ferritin in 30% CsCl solution. (23 refs.)

117301 A remote-control direct-beam exposure device for the Arndt-Wonacott rotation camera. J.R.Helliwell (Dept. of Phys., Univ. of Keele, Keele, England), A.W.Thompson.
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.579 (1 Oct. 1983).
The authors report a simple modification to the standard Enraf-Nonius backstop for the reproducible movement of the backstop 'out' and 'back into' the beam by remote control. The time spent out of the beam is variable and the total movement such that a small piece of metal foil adjacent to the backstop attenuates the direct beam in the 'out' position and lies in the pattern 'blind region' when the backstop has been returned to trap the beam. (no refs.)

117302 Measurements of EXAFS in a laboratory. K.Tohji, Y.Udagawa (Inst. for Molecular Sci., Myodaiji, Okazaki, Japan).
J. Spectrosc. Soc. Jpn. (Japan), vol.32, no.4, p.255-62 (1983). In Japanese. (21 refs.)

117303 Evaluating radiographic systems using the resolving power function. A.Notea (Dept. of Nuclear Engng., Technion-Israel Inst. of Technol., Haifa, Israel).
NDT Int. (GB), vol.16, no.5, p.263-70 (Oct. 1983).
The various definitions in common use for quantitative characterization of radiographic systems can each be derived from a more general approach involving the resolving power function. Image contrast reduction, minimum detectable change, spatial resolution and the modulation transfer function are analysed, using mainly experimental data obtained with a flash X-ray unit. Dependence on the shape of the line spread function is demonstrated by using exponential and rectangular distribution functions, and the need for a detailed knowledge of the line spread function is stressed. The modelling presented is a useful tool for predicting the limitations of a given system and for optimizing design and working procedures. (13 refs.)

117304 A miniature high-frequency X-ray radiator with a shoot-through anode. A.D.Grigor'ev, S.A.Ivanov, G.N.Platonov, N.N.Potrakhov.
Radioelectron. & Commun. Syst. (USA), vol.25, no.7, p.95-7 (1982). Translation of: *Izv. VUZ Radioelektron. (USSR)*, vol.25, no.7, p.85-7 (1982). [received: Oct. 1983]
Considers a miniature X-ray radiator with a shoot-through type target. The radiator has a glass-metal envelope consisting of the body of cylindrical shape and a glass mounting, connected hermetically to one another. The focusing electrode and the cathode with the heater are mounted on a glass mounting. Inside the mounting there is a helical slow-wave system, which forms a quarter-wave resonator with the body of the radiator. The shoot-through anode with a thin film rhenium target is soldered to the end of the radiator. (4 refs.)

117305 X-ray fluorescence analysis using the Chem-X low power wavelength dispersive spectrometer. Y.M.Gurvich (Bausch & Lomb, Sunland, CA, USA).
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.449-59
The Chem-X is an instrument combining reasonable wavelength coverage with sufficient sensitivity and speed for production control analysis—at an affordable price. It is capable of determining up to eight elements ($Z \geq 13$) simultaneously. Plug-in type monochromators can be easily exchanged by the operator; thus it is possible to keep on the shelf a 'library' of monochromators for different analytical programs. Flat crystals can be rapidly aligned to an analytical line simply by turning a single handle. The X-ray tube used in the Chem-X can be operated at up to 50 kV or 5 mA, maximum power 200 W. The cassette version of the SAS-11 software package, together with the DEC SB-11 microcomputer, allows for considerable flexibility, including major matrix correction algorithms normally available in larger X-ray systems. 07.90 OTHER TOPICS IN SPECIALISED INSTRUMENTATION

117306 A variable-temperature sample container for low-temperature neutron powder diffraction. E.Arzi (Dept. of Phys., Univ. of Tehran, Tehran, Iran), E.Sandor.
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.449-52 (1 Oct. 1983).
A variable-temperature sample container was developed for the neutron powder diffraction study of crystal structures and phase transitions in solidified gases. It consists of two coaxial tubes made of boron-free fused silica and fitted with heating coils and thermocouples. The exchange space between the tubes is filled with low-pressure helium gas controlled by two fine needle valves. Used in conjunction with a centre-stick-type liquid-helium cryostat and a proportional temperature controller, it maintains a powder sample of about 8 cm^3 volume at a constant temperature anywhere in the 4.2 to 77.4K temperature range. Its stability is not worse than ±0.15K and the liquid helium consumption is about 1 litre a day above 17K, increasing up to 6 litres a day at lower temperatures. It can also be used for the preparation of fine-grained powder samples directly from the gas phase. (3 refs.)

117307 A method for analysing the rate of liquid evaporation. J.Trzeszczynski, T.Bojko, B.Lisiecka (Polytech. Szczecinska, Szczecin, Poland).
Pomiary Autom. Kontrola (Poland), vol.29, no.3, p.73-5 (March 1983). In Polish. [received: Sept. 1983]
Describes an apparatus for analysing evaporation rate of pure liquids and their mixtures under various conditions as to temperature, humidity, and air changes. Examples of investigation results, discussion of the dependence of liquid evaporation rate on air exchange and the ratio of the evaporation liquid area to the capacity of a model chamber given. The mathematical relationships presented permit the use of the results of model testing in real conditions. (7 refs.)

11.10 FIELD THEORY

117308 Excited states of bosons and fermions in a four-Fermi quantum field theory. P.Furlan (Univ. di Trieste, Trieste, Italy), R.Raczka.
Ann. Phys. (USA), vol.149, no.2, p.296-334 (Sept. 1983).
A scalar-pseudoscalar four-Fermi quantum field model in four dimensional spacetime is considered. Introducing the scalar the pseudoscalar collective bosons, the path-integral representation for the generating functional for Green's functions in terms of the effective total action integral containing only collective bosons is expressed. Using a classical ground-state solution for collective bosons, a new formula for the generating functional for collective boson and fermion Green functions in terms of the effective propagators is derived. It is shown by a partly nonperturbative analysis that the excited

states of collective bosons do exist and form finite trajectories in the plane mass-square-spin. These trajectories for bosons are approximately linear in J, as the experimental trajectories. The existence of fermion bound or excited stars depend on the value of the dynamical parameters of the model. For some values of dynamical parameters there are bound states for $J={}^1/_2$ and ${}^3/_2$. However, for most of other values bound or excited fermion states do not exist. (19 refs.)

117309 Some remarks on the internal symmetries of relativistic wave equations. R.-K.Loide (Tallinn Polytech. Inst., Tallinn, USSR).
Acta Phys. Pol. B (Poland), vol.B14, no.9, p.671-8 (Sept. 1983).
The internal symmetries of relativistic wave equations in the free field case are treated. It is shown that the additional invariance of wave equations is connected with the transformations of physical basis. The dyal symmetry is shown to be the transformation of Lorentz basis. (20 refs.)

117310 Failure of the naive loop expansion for the effective potential in ϕ^4 field theory when there is 'broken symmetry'. C.M.Bender (Washington Univ., St. Louis, MO, USA), F.Cooper.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B224, no.3, p.4903-26 (19 Sept. 1983).
The authors determine the effective potential $V[\phi]$ in zero dimensional $g\phi^4$ field theory when there is broken symmetry classically $[V_{cl}={}^1/_4 g(\phi^2-a^2)^2]$ as a power series in $1/g$. They find that the usual loop expansion ignores a secondary minimum of the path integral and is only valid for $|\phi|\gtrsim a$. When $|ja|\lesssim 1$, where j is the external source, there is a secondary minimum of equal importance to the absolute minimum. In that region a kink solution to the differential equation for $\phi[j]$ exists, $\phi[j]=a\ \tanh(ja)+O(ja^2/ga^4)$, which interpolates between the minima at $\phi=-a$ and $\phi=+a$. They obtain the $1/g$ expansion for $V[\phi]$ for $\phi<a$ and $\phi\geq a$. For all g, a mean-field approximation gives an expression for $V[\phi]$ which interpolates between these two regimes. In higher dimensions the kink solution becomes $\phi[j]=a\ \tanh(ja\Omega)$, where Ω is the volume of space-time, suggesting a discontinuity in $\phi[j]$ in the infinite-volume limit. (15 refs.)

117311 Surface description of gauge theories. K.Bardakci (Dept. of Phys., Univ. of California, Berkeley, CA, USA), J.Greensite.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B224, no.3, p.451-68 (19 Sept. 1983).
The partition function of non-abelian gauge theory is expressed, in the continuum limit, as a sum over surfaces which are swept out by the propagation of electric flux rings. Each flux surface is described by a two-dimensional continuum gauge theory, confined to the particular surface. The gauge field can then be integrated out; however, for closed and intersecting surfaces interesting complications arise, which reveal an algebraic structure typical of strong-coupling lattice gauge theory. (7 refs.)

117312 Axial-vector anomaly for Dirac-Kahler fermions on the lattice. M.Gockeler (DESY, Hamburg, Germany).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B224, no.3, p.508-22 (19 Sept. 1983).
The axial-vector current of Dirac-Kahler fermions on the lattice is studied. The author considers a U(1) gauge theory in two dimensions as well as an SU(N) gauge theory in four dimensions. Using a short-distance expansion of the fermion propagator in an external gauge field, it is shown that the correct anomaly is reproduced in the continuum limit. (12 refs.)

117313 Topology and universality in the lattice CP^2 model. D.Petcher, M.Luscher (Inst. fur Theoretical Phys., Univ. Bern, Bern, Switzerland).
Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands), vol.B225(FS9), no.1, p.53-76 (3 Oct. 1983).
The topological susceptibility χ_t and the correlation length ξ in the CP^2 model on a two-dimensional triangular lattice are calculated by the Monte Carlo simulation method. Using variant lattice actions, the authors verify the universality of the dimensionless quantity $\chi_t\xi^2\simeq 0.09$ in the scaling region, thus indicating the presence of physical topological effects in the scaling limit. As a by-product they obtain a combinatorial formula for the topological charge. (17 refs.)

117314 Analytic approximations to Hamiltonian lattice field theories. I. Periodic gaussian model for U(1) theories. P.Suranyi (Dept. of Phys., Univ. of Cincinnati, Cincinnati, OH, USA).
Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands), vol.B225(FS9), no.1, p.77-92 (3 Oct. 1983).
Periodic gaussian models are introduced for local and global U(1) invariant hamiltonian lattice field theories. The models coincide with standard lattice theories at weak coupling but the leading non-perturbative contributions to wave functions and physical quantities are exactly calculable. Electric charges are confined and the mass gap is finite if correlations of an integer-valued magnetic field are of infinite range ($d=2+1$ gauge model). Otherwise, for {short-range correlations, the mass gap and the string tension vanish at weak coupling (QED, *XY* model, etc.). (11 refs.)

117315 Chiral symmetry restoration in baryon rich environments. J.Kogut, H.Matsuoka, M.Stone, H.W.Wyld (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA), S.Shenker, J.Shigemitsu, D.K.Sinclair.
Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands), vol.B225(FS9), no.1, p.93-102 (3 Oct. 1983).
Chiral symmetry restoration in an environment rich in baryon is studied by computer simulation methods in SU(2) and SU(3) gauge theories in the quenched approximation. The basic theory of symmetry restoration as a function of chemical potential is illustrated and the implementation of the ideas on a lattice is made explicit. A simple mean field model is presented to guide one's expectations. The second order conjugate-gradient iterative method and the pseudo-fermion Monte Carlo procedure are convergent methods of calculating the fermion propagator in an environment rich in baryon. Computer simulations of SU(3) gauge theory show an abrupt chiral symmetry restoring transition and the critical chemical potential and induced baryon density are estimated crudely. A smoother transition is observed for the color group SU(2). (8 refs.)

117316 Wilson loops for U(4) and SU(4) lattice gauge theories in four dimensions. D.Barkai (Inst. for Computational Studies, Colorado State Univ., Fort Collins, CO, USA), M.Creutz, K.J.M.Moriarty.
Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands), vol.B225(FS9), no.1, p.156-68 (3 Oct. 1983).
Monte Carlo simulations are used to calculate Wilson loops for pure U(4) and SU(4) gauge theories on a 6^4 lattice. The first-order phase transition previously observed in the average action per plaquette for U(4) and SU(4) is also seen in the string tension. U(4) and SU(4) color seem to be confined while U(1) charge in U(4) appears to be deconfined. (15 refs.)

117317 Instability of the mean field vacuum in lattice gauge theories. Guo Shuo-hong, Chen Qi-zhou, Liu Jin-ming, Ji Zhe-rui (Dept. of Phys., Zhongshan Univ., Guangzhou, China).
Commun. Theor. Phys. (China), vol.2, no.3, p.1115-19 (1983).
The authors calculate the interaction energy between a heavy quark pair in the Hamiltonian formulation of lattice gauge theories. Mean field-variational calculations show that the upper limit of the string tension is zero in the weak coupling region if an approximate vacuum state of the mean field type is used. The mean field vacuum is unstable against forming closed flux loops. (9 refs.)

117318 Simple α-parametric integrals for renormalised Feynman amplitudes. V.I.Kucheryavii.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.7, p.59-63 (1983). In Ukrainian.
Simple formulas are obtained for regular (finite) and singular parts of divergent Feynman amplitudes. These formulas are true for Feynman amplitudes of the smallest nontrivial orders of the perturbation theory irrespective of the kind of matrix elements and type of quantum field models with polynomial and quasi-polynomial interactions in n-dimensional space-time. (10 refs.)

117319 Elements for a Lie-isotopic gauge theory. M.Gasperini (Inst. di Fisica, Univ. degli Studi, Bologna, Italy).
Hadronic J. (USA), vol.6, no.4, p.935-44 (July 1983).
The author suggests the possibility of gauging a Lie-isotopic symmetry and, in analogy with conventional gauge theories, the author introduces the isotopic covariant derivatives and field strengths. The author shows that the requirement of local isotropic invariance is compatible with the introduction of a variable, effective, gauge coupling, and leads naturally to couple in a minimal way the gauge potential to the geometry of a curved manifold with an anti-symmetric connection. (32 refs.)

117320 Algebraic identities and invariant vector fields on H-spaces. A.A.Sagle (Inst. for Basic Res., Cambridge, MA, USA), J.P.Holmes.
Hadronic J. (USA), vol.6, no.4, p.945-55 (July 1983).
The authors study the equivalence of certain algebraic and geometric properties for analytic H-spaces utilizing vector fields. They define vector fields $l(x)$ and r(x) on an H-space which become the usual left and right vector fields in the case of a Lie group. Utilizing these vector fields, the local associativity, local power associativity and local alternative identities are characterized as invariance properties of these vector fields by suitable functions. These functions are in the semi-group G generated by the left and right multiplication functions (and their inverses, if they exist). They are considering the invariance of the vector fields under subsemi-groups generated by suitable functions in G. As a result of this, the Campbell-Hausdorff Theorem for H-spaces is related to alternative algebras and the invariance of the $l(x)$ and r(x) vector fields. All of these results are done in terms of differential equations. Thus, considering the recent use of nonassociative algebras in hadron physics, these results now give the physicist direct access to relevant identities. In particular, they discuss how this process applies to other identities and vector fields. (3 refs.)

117321 Causality between preparation and registration processes in relativistic quantum theory. H.Neumann (Fachbereich Phys., Philipps-Univ., Marburg, Germany), R.Werner.
Int. J. Theor. Phys. (USA), vol.22, no.9, p.781-802 (Sept. 1983).
A causality postulate is considered which is based on the conception of systems that are prepared in some finite region of space-time and recorded in some other region. If these regions are spacelike separated, the recording apparatus should react as if no preparing apparatus were present, i.e. it should respond with at most some vacuum rate. The causality postulate is mathematically formulated within the framework of statistical theories. The connections with algebraic field theory are discussed and the relation between causality and spectral conditions is studied. General methods for constructing systems satisfying the causality postulate are given and applied in several examples. (20 refs.)

117322 The scattering of two Yang-Mills plane waves. Y.Nutku (Dept. of Maths., Bosphorus Univ., Istanbul, Turkey).
J. Phys. A (GB), vol.16, no.15, p.L583-86 (21 Oct. 1983).
The author considers the head-on collision of two sandwich plane waves in nonAbelian gauge theory. A classical solution of the Yang-Mills field equations is obtained describing the scattering of weak plane waves. It is shown that after the collision the gauge field acquires a new inductive aspect due to the nonlinear interaction between these waves. (8 refs.)

117323 Phase transitions in nonlinear Abelian Higgs models. I.D.Lawrie, C.Athrone (Dept. of Phys., Univ. of Leeds, Leeds, England).
J. Phys. A (GB), vol.16, no.15, p.L587-90 (21 Oct. 1983).
Phase transitions in O(n) nonlinear σ models coupled to an Abelian gauge field are studied near two dimensions. For all $n>0$, the transition is governed by the renormalisation-group fixed point of the CP^{2n-1} model. There is no fluctuation-induced first-order transition. (12 refs.)

117324 The quantum fluctuations of (1+1)-dimensional real scalar fields around solitons at the finite temperatures. S.Chen, G.Ni (Dept. of Phys., Univ. of Illinois, Urbana-Champaign, IL, USA).
J. Phys. A (GB), vol.16, no.15, p.3493-506 (21 Oct. 1983).
The authors investigate the quantum fluctuations of real scalar fields in a $(1+1)$-dimensional space around the solitons at the finite temperatures, using a method based on the real-time Green function approach. They calculate the temperature dependence of the soliton masses in a sine-Gordon system and a ϕ^4 system respectively. They have taken into account the corrections due to the existence of bound states and the phase shifts for continuum states in soliton potentials. (16 refs.)

117325 Lorentz covariance of an extended object in the tree approximation. II. Nonspherical object in 3+1 dimensions. M.Umezawa (Univ. Louis Pasteur, Strasbourg, France).
J. Math. Phys. (USA), vol.24, no.9, p.2348-65 (Sept. 1983).
For pt.I see Phys. Rev. D, vol.24, p.1548 (1981). This is the second in the series of the papers in which the author investigates the Lorentz covariance of the extended object. In this paper the author examines the covariance of the deformed object in $3+1$ dimensions in the tree approximation. The author constructs the solution of the Euler equation which is Lorentz covariant. In such a covariant solution, the variables associated with the rotational and the translational zero modes appear as classical quantum mechanical operators. Consequently the covariant solution has an intrinsic spin in addition to the intrinsic quantum mechanical momenta. Then, at the end of this work the author will show that such a covariant solution can be obtained also by quantizing a classical solution of the Euler equation, having extra variables signifying the center and the orientation of the deformed object. In the tree approximation, the energy-momentum and the relativistic angular momentum of the extended object ψ become pure classical quantum mechanical operators, having been integrated over the space. Then it is proven that such four-momenta and angular momentum operators form a classical quantum

mechanics presented in a relativistic manner. The center of mass of the extended object, often called collective coordinate, is shown to be made of these four-momentum and angular momentum. This center of mass and the four-momentum operators form a quantum mechanics presented in the conventional form. (24 refs.)

117326 An SL(2,*C*)-invariant representation of the Dirac equation. II. Coulomb Green's function. L.C.Hostler (Phys. Dept., Wilkes Coll., Wilkes-Barre, PA, USA).
J. Math. Phys. (USA), vol.24, no.9, p.2366-73 (Sept. 1983).
For pt.I see ibid., vol.23, p.1179 (1982). The Kepler problem for the Klein-Gordon type wave equation $\{\Pi_\mu \Pi_\mu + m^2 + ie\sigma.(\mathcal{E}+i\mathbf{B})\}\phi=0$, investigated earlier (J. Math. Phys. 23, 1179, 1982) and proven to be equivalent to the conventional Dirac equation, is discussed. In this equation ϕ is a 2×1 Pauli spinor and σ_a, $a=1,2,3$, are the usual 2×2 Pauli spin matrices. Quite simple expressions for the bound state Coulomb wavefunctions and for the Coulomb Green's function are obtained by exploiting the concept of 'coupling constant eigenfunction'. The facilitate the direct use of these simple expressions in Coulomb calculations, a stationary state perturbation theory appropriate for the Klein-Gordon type wave equation itself is described. (19 refs.)

117327 Infinitesimal symmetries and conserved currents for nonlinear Dirac equations. P.H.M.Kersten (Dept. of Appl. Math., Twente Univ. of Technol., Enschede, Netherlands).
J. Math. Phys. (USA), vol.24, no.9, p.2374-6 (Sept. 1983).
The complete algebras of infinitesimal symmetries for Dirac equations, Dirac equations with nonvanishing rest mass, and Dirac equations with a nonlinear term have been established. In addition, conserved currents associated to new symmetries have been constructed. (10 refs.)

117328 U(*N*) and SU(*N*) lattice gauge theories, in the weak-coupling region, in four dimensions. M.Creutz (Dept. of Phys., Brookhaven Nat. Lab., Upton, NY, USA), K.J.M.Moriarty.
J. Phys. G (GB), vol.9, no.10, p.L207-10 (Oct. 1983).
Monte-Carlo simulations on a 6^4 lattice are employed to calculate the 1×1 Wilson loops $W(1, 1)$ and the associated string tension for pure U(N) and SU(N), N=2, 3, 4, 5 and 6, gauge theories in the weak-coupling region. It is shown that $\mathrm{U}(N) \to \mathrm{SU}(N)$ as N increases, with $\mathrm{U}(6) \simeq \mathrm{SU}(6)$. (9 refs.)

117329 On the relationship between Abelian and SU_2 *n*-monopoles. M.Quiros (Inst. de Estructura de la Materia, Madrid, Spain), E.Rodriguez.
Nuovo Cimento A (Italy), vol.76A, ser.2, no.3, p.495-508 (1 Aug. 1983).
Using the embedding of the Hopf bundle into the trivial bundle $S^2 \times S^3$, the authors obtain the Dirac-Wu-Yang regular vector potential on S^3 from the 't Hooft-Polyakov monopole field. Furthermore, it is shown that the electromagnetism bundle S^3/Z_n is a U_1 reduced bundle of $S^2 \times S^3$. From this bundle reduction and the connection one-form on S^3/Z_n they get the asymptotic behaviour of the SU_2 n-monopole field. Axial symmetry, usually assumed for BPS monopoles is obtained and the asymptotic behaviour of n-monopole solutions of the Ernst equation is predicted. (27 refs.)

117330 The stringless gague potential of accelerated monopole. Kang-Jie Shi (Univ. of Illinois, Urbana-Champaign, IL, USA), Yu-Bin Wang, Bo-Yu Hou.
Nuovo Cimento A (Italy), vol.76A, ser.2, no.3, p.556-68 (1 Aug. 1983).
The authors get the U_1 potential without singular string for an accelerated magnetic pole. To obtain this they find its equivalent SU_2 potential, which could be expressed by an U_1-invariant section of the SU_2/U_1 coset bundle. Then they could superpose linearly the corresponding U_1 potentials to get the potential of an accelerated system of monopoles and electric charges in the general case. They also discuss the criterion for U_1 field to be in one-to-one correspondence with an U_1-invariant section and the condition for a SU_2 field to be reducible to an U_1 field. (8 refs.)

117331 On Dirac-like equations in 2*n*-dimensional spaces. II. P.Budinich, P.Furlan (Internat. School for Advanced Studies, Trieste, Italy).
Nuovo Cimento A (Italy), vol.76A, ser.2, no.3, p.569-95 (1 Aug. 1983).
For pt. I see ibid., vol.70, no.3, p.243-72 (1982). The naturally $IO_{4,2}$ covariant spinor field equations $\Gamma_a(\partial/\partial\eta_a)\xi(\eta)=0$ and $\Gamma_a(\partial/\partial\eta_a)\xi(\eta)=\Gamma_7\phi(\eta)\xi(\eta)$ in pseudo-Euclidean space $M^{4,2}$, of which the first may be derived from the definition of pure conformal semi-spinors and the second from the one of pure conformal spinors are first reduced, with the Dirac method, to a five-dimensional projective space and then solved exactly with respect to the fifth variable, which is then eliminated with an invariant procedure, bringing them to a system of equations in Minkowski space-time $M^{3,1}$. The first of the two equations presents solutions which are apt to reproduce the main features of weak interactions. (7 refs.)

117332 One-dimensional exactly integrable dynamical systems (classical and quantum regions). I.A.Fedoseev, A.N.Leznov (IHEP, Serpukhov, USSR), M.V.Saveliev.
Nuovo Cimento A (Italy), vol.76A, ser.2, no.3, p.596-612 (1 Aug. 1983).
The authors develop an approach for the construction of explicit solutions to a wide class of essentially nonlinear exactly integrable one-dimensional systems in classical and quantum regions. The systems describe, in particular, monopole configurations for an arbitrary embedding of SU_2 in a gauge group with a Higgs field in the adjoint representation and with vanishing self-coupling. The approach is based on the application of the usual perturbation theory methods in the framework of the Yang-Feldman formalism and gives an exact solution of the classical equations and the Heisenberg operators in the quantum case as finite polynomials over a coupling constant. An investigation of the systems in the Schrodinger picture is also given. In this, the wave functions are expressed directly via the matrix elements of the principal continuous series of the unitary irreducible representations of the real forms of the semisimple Lie groups between the states, which are the generalized Whittaker vectors. (14 refs.)

117333 Self-dual SU$_2$ Yang-Mills fields in Minkowski space. E.Kyriakopoulos (Phys. Lab. A, Nat. Tech. Univ., Athens, Greece).
Nuovo Cimento A (Italy), vol.76A, ser.2, no.4, p.645-62 (21 Aug. 1983).
It is shown that all self-dual SU$_2$ Yang-Mills fields in Minkowski space can be obtained from the solutions of a system of nonlinear partial differential equations of second order and some arbitrary functions. Certain features of these fields are pointed out. The complex field, whose real part is the De Alfaro-Fubini-Furlan solution (1977) is presented as solution of the nonlinear system. (11 refs.)

117334 The classical supersymmetric CP^{N-1} model. M.Schweda, J.Weigl (Inst. fur Thoretische Phys., Tech. Univ. Wien, Wien, Austria).
Nuovo Cimento A (Italy), vol.76A, ser.2, no.4, p.715-22 (21 Aug. 1983).
At the classical level the model under consideration contains a spinorial gauge superfield A_a, which is not a dynamical field variable. The authors discuss some aspects of the superconformal supersymmetry in the presence of this gauge field by explicit calculation. Their results are governed by gauge invariance and the equation of motion for the A_a-field. (5 refs.)

117335 Elementary particle as a localized excitation of the action function. G.I.Sivashinsky (Dept. of Math., Univ. of California, Berkeley, CA, USA).
Nuovo Cimento A (Italy), vol.77A, ser.2, no.1, p.21-38 (1 Sept. 1983).
By developing the analogy between the equation for the propagation of a flame and the Hamilton-Jacobi equation of relativistic mechanics, one constructs a modified Hamiltonian-Jacobi equation: $(1/c^2)S_t{}^2-(\nabla S)^2=m^2c^2+\alpha\hbar\Box S+(\beta\hbar^3/m^2c^2)\Box^2 S$. This equation admits solutions in the form of oscillating solitons. The possible connection between this kind of solutions and quantum mechanics is discussed. (9 refs.)

117336 Aspects of gauge variance and geometry in a fermionic *-product formalism. B.Lesche (Max-Planck-Inst. fur Phys. und Astrophys., Munich, Germany).
Nuovo Cimento A (Italy), vol.77A, ser.2, no.2, p.121-34 (21 Sept. 1983).
The author gives a phase-space formulation for quantized fermion fields and discusses geometric and gauge properties in this framework. (14 refs.)

117337 Infra-red behaviour of the gluon propagator in axial gauges. D.Atkinson (Inst. for Theoretical Phys., Groningen, Netherlands), P.W.Johnson, W.J.Schoenmaker, H.A.Slim.
Nuovo Cimento A (Italy), vol.77A, ser.2, no.2, p.197-213 (21 Sept. 1983).
Closed systems of approximate Dyson-Schwinger equations for the gluon propagator are investigated, in which the simplest Slavnov-Taylor identity is respected. It is rendered plausible that the model of Baker, Ball and Zachariasen (1981), which does yield a confining singularity, cannot consistently dispense with the dependence on the gauge parameter. A spectral model of Delbourgo (1979, 1981) is shown to violate the Slavnov-Taylor identity in an unacceptable manner. An improved spectral model is introduced. (12 refs.)

117338 Quasi-local charges in Yang-Mills theory. K.P.Tod (Math. Inst., Univ. of Oxford, Oxford, England).
Proc. R. Soc. London Ser. A (GB), vol.389, no.1797, p.369-77 (8 Oct. 1983).
A definition of quasi-local charges in Yang-Mills theory, in the spirit of Penrose's quasi-local momentum in general relativity (1982), is proposed. (12 refs.)

117339 The energy-momentum operator in curved space-time. M.R.Brown, A.C.Ottewill (Dept. of Astrophys., Univ. of Oxford, Oxford, England).
Proc. R. Soc. London Ser. A (GB), vol.389, no.1797, p.379-403 (8 Oct. 1983).
The authors argue that the only meaningful geometrical measure of the energy-momentum of states of matter described by a free quantum field theory in a general curved space-time is that provided by a normal ordered energy-momentum operator. They contrast the finite expectation values of this operator with the conventional renormalized expectation values and further argue that the use of renormalization theory is inappropriate in this context. (30 refs.)

117340 Variational study of vacuum wave function for lattice gauge theory in 2+1 dimension. H.Arisue, M.Kato, T.Fujiwara (Kyoto Univ., Kyoto, Japan).
Prog. Theor. Phys. (Japan), vol.70, no.1, p.229-48 (July 1983).
The vacuum wave function for SU(2) lattice gauge theory (without quarks) in 2+1 dimensions (two discrete space and one continuous time) is studied using the Rayleigh-Ritz variational method. Trial wave function for the vacuum contains loop variables enclosing up to two plaquettes, whose coefficients are taken as variational parameters. It is found that the coefficients of two-plaquette loop variables are small compared with that of one-plaquette loop variables not only in the strong-coupling regime but also in the weak coupling region. This fact means that the dominant configuration of the vacuum is mutually independent magnetic fluctuations in each plaquette and enables the authors to perform a perturbative expansion with respect to these small coefficients. The string tension and the wave function of the first excited state are investigated using the vacuum wave function obtained, and the scaling behaviours of the string tension and the mass gap are much improved by the introduction of two-plaquette loop variables compared with the case of the vacuum wave function containing only one-plaquette loop variables. (16 refs.)

117341 Supersymmetry and scale-dependent analysis. M.Ikeda (Dept. of Phys., Osaka City Univ., Osaka, Japan).
Prog. Theor. Phys. (Japan), vol.70, no.1, p.249-58 (July 1983).
It is argued that scale-dependent analysis shows a restoration of supersymmetry although temperature dependent analysis does not indicate such a restoration of supersymmetry (if initially broken). The author demonstrates this explicitly in the two-dimensional O(N) Wess-Zumino model that has both supersymmetric and broken-supersymmetric phases. In the broken-supersymmetric phase, there is a critical resolution $\mathrm{R_c}$ that is renormalization group invariant. The vacuum undergoes a phase transition in resolution R; for $\mathrm{R}<\mathrm{R_c}$ the vacuum is in a disordered phase while for $\mathrm{R}>\mathrm{R_c}$ it is in an ordered phase. The resolution-dependent analysis is also applicable to supersymmetric theories as well as to QCD and GUT. (14 refs.)

117342 Effective gauge interaction of Weyl fermions: extended-MAC scenario. K.-I.Aoki, M.Bando (Kyoto Univ., Kyoto, Japan).
Prog. Theor. Phys. (Japan), vol.70, no.1, p.259-71 (July 1983).
Effective gauge interaction of massless Weyl fermions is investigated for the $\mathrm{j}={}^1/_2$-state sector. In addition to the familiar λ-λ term there arises $\lambda\sigma$-$\lambda\sigma$ term which leads a strong dependence of the interaction energy of a trial state on its spin and chiral structure. With this Hamiltonian the authors perform the extended-MAC (EMAC) scenario. They analyze two fermion systems and show that LR state is more attractive than LL state. The EMAC scenario enables investigation of the structure of various multifermion condensations, which will be explicitly done in a separate article. (4 refs.)

117343 Hierarchical multi-fermion condensation in extended-MAC scenario. K.-I.Aoki, M.Bando (Kyoto Univ., Kyoto, Japan).
Prog. Theor. Phys. (Japan), vol.70, no.1, p.272-83 (July 1983).
By the use of the effective gauge interaction of massless Weyl fermions derived in a preceding article, the authors perform the extended-MAC (EMAC) scenario to analyze multifermion systems. They show that a 2-n-body multifermion state $(\mathrm{LR})^n$ becomes more attractive as n increases. They conclude that in a confining gauge theory multifermion operators can develop vacuum expectation values of various scales. This mechanism of hierarchy in condensations provides a possible origin of the fermion mass hierarchy among generations in sublepton/quark models. (6 refs.)

117344 Quantum theory of massive Yang-Mills fields. III. Renormalizable structure. T.Fukuda, H.Matsuda, Y.Seki, K.Yokoyama (Res. Inst. for Theoretical Phys. Hiroshima Univ. Hiroshima Japan).
Prog. Theor. Phys. (Japan), vol.70, no.1, p.284-97 (July 1983).
For pt.II see ibid., vol.67, p.1206 (1982). The renormalizable structure of a massive Yang-Mills field theory proposed previously is revealed in view of nonpolynomial Langrangian theories. Analytic properties of several relevant superpropagators are elucidated in the sense of distributions. It is shown that these regularized superpropagators exhibit a strong infinity-suppression

mechanism making the theory renormalizable. There appears a divergence-free model as a subcase of the present theory. (18 refs.)

117345 Equivalence of stochastic quantization method to conventional field theories through super transformation invariance. H.Nakazato, M.Namiki, I.Ohba, K.Okano (Dept. of Phys., Waseda Univ., Tokyo, Japan).
Prog. Theor. Phys. (Japan), vol.70, no.1, p.298-307 (July 1983).
The equivalence of the stochastic quantization method to the usual quantization method is proved to all orders in perturbation for scalar field theories. The proof is based on invariance under a sort of 'super transformation'. (8 refs.)

117346 Gauge fixing condition as non-holonomic constraint in stochastic quantization of non-abelian gauge fields. H.Nakogoshi, M.Namiki, I.Ohba, K.Okano (Dept. of Phys., Waseda Univ., Tokyo, Japan).
Prog. Theor. Phys. (Japan), vol.70, no.1, p.326-9 (July 1983).
In stochastic quantization of non-Abelian gauge fields, the authors introduce a sort of non-holonomic constraint working as a covariant gauge fixing condition in the Langevin equation, and show that the new condition kills fictitious time-dependent divergent terms keeping the gauge invariance and the unitarity without help of any ghost field. The procedure also suggests a possible way of quantizing non-holonomic systems. (6 refs.)

117347 Boundary conditions on the monopole Dirac equation. C.G.Callan,Jr. (Inst. for Advanced Study, Princeton, NJ, USA), S.R.Das.
Phys. Rev. Lett. (USA), vol.51, no.13, p.1155-8 (26 Sept. 1983).
Boundary conditions on the monopole Dirac equation are, on the one hand, determined by the requirement that the Hamiltonian be Hermitean. On the other, they enforce the conservation of certain charges at the monopole core. Which charges should be conserved is determined by the short-distance physics of the problem and the connection with boundary conditions is worked out for several cases. It is found to be possible to impose physically reasonable conservation-law requirements which can be realized by no Dirac-equation boundary condition. (5 refs.)

117348 A superfield formulation of stochastic quantization with fictitious time. E.Egorian (Theoretical Phys. Dept., Erevan Inst. of Phys., Erevan, USSR), S.Kalitzin.
Phys. Lett. B (Netherlands), vol.129B, no.5, p.320-2 (29 Sept. 1983).
Proves the equivalence between the D-dimensional scalar quantum field theory and the corresponding $D+1$ (with fictitious time) stochastically quantized field theory. The superdiagram technique is used within perturbation theory. The independence of the Green's functions on the fictitious time is shown. (4 refs.)

117349 The latent heat of deconfinement in SU(3) Yang-Mills theory. T.Celik, J.Engels, H.Satz (Fakultat fur Phys., Univ. Bielefeld, Bielefeld, Germany).
Phys. Lett. B (Netherlands), vol.129B, no.5, p.323-7 (29 Sept. 1983).
Calculates the latent heat of deconfinement in SU(3) Yang-Mills theory from the difference in energy density between the deconfined and the confined phases at the critical temperature T_c. The calculation is based on a high statistics Monte Carlo evaluation using lattices with 8^3 and 10^3 spatial sites and 2, 3 and 4 temperature sites. Both T_c and the latent heat $\Delta\epsilon$ are shown to satisfy scaling. The authors find $T_c=208\pm20$ MeV, $\Delta\epsilon/T_c{}^4=3.75\pm0.25$; the latter is in accord with bag model arguments. (18 refs.)

117350 On the consistency of the Wess-Zumino model. C.T.Sachrajda, G.Thompson (Dept. of Phys., Univ. of Southampton, Southampton, England).
Phys. Lett. B (Netherlands), vol.129B, no.6, p.414-16 (6 Oct. 1983).
The authors study the three-point function, $\Gamma(p_1{}^2,\ p_2{}^2,\ p_3{}^2)$, of the Wess-Zumino model in the limit where $p_2{}^2 \simeq p_3{}^y 2 \to \infty$. Contrary to the conclusions of some recent publications, they find that this three-point function can vanish sufficiently quickly in this limit for the Schwinger-Dyson equations to be consistent and without violating other known properties of the model. (5 refs.)

117351 Supersymmetric Yang-Mills theories and twistors. I.V.Volovich (Steklov Math. Inst., Moscow, USSR).
Phys. Lett. B (Netherlands), vol.129B, no.6, p.429-31 (6 Oct. 1983).
A twistor description of the equations of motion for supersymmetric Yang-Mills theories is proposed. Remarkable geometrical properties of the $N=4$ theory are pointed out. (10 refs.)

117352 Second order phase transition in a four-dimensional Z_2 gauge theory. P.Rujan (Inst. for Theoretical Phys., Budapest, Hungary), A.Patkos.
Phys. Lett. B (Netherlands), vol.129B, no.6, p.437-9 (6 Oct. 1983).
The ground state of a Z_2 theory with mixed action is calculated exactly. The vacuum structure implies the existence of a second order transition related to that of the three-dimensional Ising model. (7 refs.)

117353 Canonical quantization of the sine-Gordon system in the multisoliton sector. H.Matsumoto, H.Umezawa (Theoretical Phys. Inst., Univ. of Alberta, Edmonton, Alberta, Canada).
Phys. Rev. D (USA), vol.28, no.6, p.1434-40 (15 Sept. 1983).
The sine-Gordon system is quantized in the presence of several solitons. In direct analogy to the classical conservation laws, one finds new conserved quantum-mechanical operators which form commuting Poincare algebras and which generate relative motions among the solitons. The appearance of the quantum coordinates in the Heisenberg field operator and the form of the Hamiltonian are determined uniquely. Although in the no-particle sector the solitons are noninteracting, it is found that an interaction appears when particle quanta become excited. Though obtained in the context of the sine-Gordon equation, these results are valid for all multisoliton solutions of $(1+1)-$dimensional equations. (9 refs.)

117354 Semiclassical quantization of the complex sine-Gordon field theory. H.J.de Vega, J.M.Maillet (Lab. de Phys. Theorique et Hautes Energies, Univ. Pierre et Marie Curie, Paris, France).
Phys. Rev. D (USA), vol.28, no.6, p.1441-52 (15 Sept. 1983).
The complex sine-Gordon model, a classically integrable field theory which exhibits highly nontrivial renormalization properties, is quantized semiclassically. The classical multisoliton solutions are derived by the inverse scattering method. The semiclassical mass spectrum is obtained from these results by computing the small-fluctuation determinant around the one-soliton solution. Dimensional regularization is used here. The particle spectrum turns out to be constituted by bound states of fundamental particles of like charge. Finally, the semiclassical S matrix is calculated and crossing symmetry is exhibited. (16 refs.)

117355 Boson representation and variational method for O(N) spin systems in 1+1 dimensions. T.Matsui (Dept. of Phys., Purdue Univ., West Lafayette, IN, USA).
Phys. Rev. D (USA), vol.28, no.6, p.1453-60 (15 Sept. 1983).
The author studies the ground state and the correlation functions of O(N) Heisenberg spin systems in $1+1$ dimensions by applying a simple variational method to the Hamiltonian described in a boson representation. The results in our method are compatible with the analysis of the large-N limit. (19 refs.)

117356 New test for spontaneous breakdown of supersymmetry. C.M.Bender (Dept. of Phys., Washington Univ., St. Louis, MO, USA), E.Cooper, A.Das.
Phys. Rev. D (USA), vol.28, no.6, p.1473-80 (15 Sept. 1983).
The authors propose a new nonperturbative test for supersymmetry breaking. The test is first to break supersymmetry by introducing a lattice and then to study the behavior of the ground-state energy as a function of the lattice spacing a. They assume that as a approaches zero, $E_0 \sim ca^\gamma$, where c is a nonzero constant and γ is a critical exponent. If γ is positive as $a \to 0$, the ground-state energy of the continuum theory is zero and the theory is supersymmetric. On the other hand, if γ is zero or negative, then supersymmetry is broken. They verify this test in the context of supersymmetric quantum mechanics using a strong-coupling expansion to calculate E_0 and γ. They find that for the supersymmetric version of g^2x^6 quantum mechanics, $\gamma=1.16\pm0.02$, whereas γ is consistent with zero when we consider the supersymmetric extension of g^2x^4 theory. (9 refs.)

117357 Finiteness of broken $N=4$ super Yang-Mills theory. M.A.Namazie (Internat. Centre for Theoretical Phys., Trieste, italy), A.Salam, J.Strathdee.
Phys. Rev. D (USA), vol.28, no.6, p.1481-90 (15 Sept. 1983).
Using a light-cone gauge formulation for $N=4$ extended supersymmetry, it is shown that an explicit breaking of the supersymmetry by the addition of mass terms does not disturb off-shell finiteness to any order provided the sum of fermion masses equals the sume of scalar masses and appropriate cubic interactions between scalars are included. (14 refs.)

117358 Gauge theories with composite bosons. M.H.Friedman, Y.N.Srivastava (Dept. of Phys., Northeastern Univ., Boston, MA, USA).
Phys. Rev. D (USA), vol.28, no.6, p.1491-5 (15 Sept. 1983).
The authors develop an approach for introducing bosons into gauge theories as composite states of fermions. It is scale and gauge invariant from the outset and utilizes invariant regularization procedures. This results in the acquisition of gauge-covariant kinetic energy by the bosons and the growth of coupling constants and masses. Relationships among the coupling constants and masses are derived. (9 refs.)

117359 Breaking of conservations laws induced by magnetic monopoles in the Rubakov-Callan model. Tung-Mow Yan (Newman Lab. of Nuclear Studies, Cornell Univ., Ithaca, NY, USA).
Phys. Rev. D (USA), vol.28, no.6, p.1496-505 (15 Sept. 1983).
The author has explored further implications of the model of Rubakov and Callan for a gauge theory with massless fermion isodoublets in the presence of a 't Hooft-Polyakov monopole. In a world with only one left-handed isodoublet, the fermion field is found to have a nonzero vacuum expectation value. The author has studied a model with two doublets and find that there exist condensates, some of which break chirality and charge (and color) conservation, and some others conserve chirality but break charge conservation. Unlike the proton-decay catalysis, these effects depend explicitly on the monopole size and are large only in the neighborhood of a monopole. Their existence is shown to be a necessary consequence of the boundary condition in the model. (17 refs.)

117360 Lattice gauge theory in the microcanonical ensemble. D.J.E.Callaway (CERN, Geneve, Switzerland).
Phys. Rev. D (USA), vol.28, no.6, p.1506-14 (15 Sept. 1983).
The microcanonical-ensemble formulation of lattice gauge theory proposed recently is examined in detail. Expectation values in this new ensemble are determined by solving a large set of coupled ordinary differential equations, after the fashion of a molecular dynamics simulation. Following a brief review of the microcanonical ensemble, calculations are performed for the gauge groups U(1), SU(2), and SU(3). The results are compared and contrasted with standard methods of computation. Several advantages of the new formalism are noted. For example, no random numbers are required to update the system. Also, this update is performed in a simultaneous fashion. Thus the microcanonical method presumably adapts well to parallel processing techniques, especially when the action is highly nonlocal (such as when fermions are included). (23 refs.)

117361 Universality conditions for the Lorentz invariance of the Wilson loop in the deconfining phase of the Villain gauge theory. N.Gupte (Inst. for Theoretical Phys., State Univ. of New York, Stony Brook, NY, USA).
Phys. Rev. D (USA), vol.28, no.6, p.1515-26 (15 Sept. 1983).
The authors has performed gauge-invariant calculations for a four-dimensional Villain field theory where each orientation of the elementary plaquette carries a different weight $E_{\mu\nu}$. There are thus six possible Es in four dimensions. This general theory is interesting because the presence of six Es gives us an insight into universality arguments for four-dimensional gauge theories. It is not necessary that the field theory by Lorentz invariant in the presence of six coupling constants E. It may be necessary to impose some restriction on the six $E_{\mu\nu}$s to make the field theory Lorentz invariant. In this case we would say that 'conditional universality' holds. The theory satisfies 'unconditional universality' if Lorentz invariance holds even if no restrictions are placed on the six Es. The author obtains an expression for the Wilson loop in the nonconfining phase of the Villain gauge theory. The author finds that the Wilson loop is Lorentz invariant despite the fact that no restrictions are placed on the six Es. (12 refs.)

117362 Fermion mutilation on a body-centered tesseract. W.Celmaster, F.Krausz (Northeastern Univ., Boston, MA, USA).
Phys. Rev. D (USA), vol.28, no.6, p.1527-9 (15 Sept. 1983).
The authors construct a chiral Lagrangian on a body-centered four-dimensional hypercubic lattice. A form of fermion doubling is observed in the continuum limit. However, because some of the spurious excitations do not propagate as particles, the resulting continuum field theory is not Lorentz invariant. (14 refs.)

117363 Symmetry behavior in an external field. S.Kawati, G.Konisi, H.Miyata (Dept. of Phys., Kwansei Gakuin Univ., Nishinomiya, Japan).
Phys. Rev. D (USA), vol.28, no.6, p.1537-41 (15 Sept. 1983).
The authors reexamine the recent work about a response of an applied external electromagnetic field to the Gross-Neveu model and comment on the phase transition induced by the external field. They also discuss a four-dimensional model exposed by a pure magnetic field. (9 refs.)

117364 Classical head-on collisions between charges and monopoles. H.M.Lai, K.Young (Dept. of Phys., Chinese Univ. of Hong Kong, Hong Kong).
Phys. Rev. D (USA), vol.28, no.6, p.1552-3 (15 Sept. 1983).
By considering heat-on collisions, it is shown that the classical theory of point charges and point monopoles is inconsistent if there is no spin. In the presence of spin, the theory is consistent but contains an anomaly, similar to the well-known field-theoretic anomalies. This leads to a simple picture of some aspects of the physics of monopole catalysis of baryon decay. (8 refs.)

117365 Fixed points of $(\phi^6)_3$ and $(\phi^4)_4$ theories. R.D.Pisarski (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA).
Phys. Rev. D (USA), vol.28, no.6, p.1554-6 (15 Sept. 1983).
The author suggests how the presence of an ultraviolet and a nontrivial infrared-stable fixed point in $(\phi^6)_3$ theory could be related to the (presumed) absence of any nonzero fixed points in $(\phi^4)_4$ theory. (10 refs.)

117366 Background-field gauge and decoupling of massive fermions in unbroken gauge theories. U.Chattopadhyay (Inst. for Theoretical Phys., State Univ. of New York, Stony Brook, NY, USA).
Phys. Rev. D (USA), vol.28, no.6, p.1557-9 (15 Sept. 1983).
In an unbroken gauge with coupling constant g containing very heavy fermions of mass M, the low-energy phenomena involving the gauge bosons only can be described by a pure Yang-Mills theory with a different coupling constant g^* which can be determined as a function of g and M order by order in perturbation theory. Working in the background-field gauge the author demonstrates by explicit calculation that the relation between g^* and g and M up to two-loop orders is independent of the gauge-fixing parameter of the original theory. (4 refs.)

117367 Supersymmetric Savvidy state for SU(2), SU(3) and SU(4). D.Kay (Dept. of Phys. & Theoretical Sci. Inst., Simon Fraser Univ., Burnaby, Canada).
Phys. Rev. D (USA), vol.28, no.6, p.1562-5 (15 Sept. 1983).
The Savvidy Ansatz of a covariantly constant background field in a Yang-Mills theory is used to calculate the one-loop quantum correction to the effective energy density in a supersymmetric gauge theory. This is done, with matter fields included, for the gauge groups SU(2), SU(3), and SU(4). The beta function is also calculated, and the author finds that asymptotic freedom is assured for less than 6, 9 and 12 flavors in SU(2), SU(3), and SU(4) respectively. (6 refs.)

117368 Fock space and the gauge invariance. Yu.V.Novozhilov.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.69-71 (Aug. 1983). In Russian.
Starting from the Fock space definition of the scalar product a set of gauge invariant multiparticle states is constructed. A gauge choice is made in such a way (for example axial gauges or a light-like gauge) that creation operators transform homogeneously under residual gauge transformations. Then, the equations for phase factors linking creation operators at different points can be formulated in terms of creation operators only. A simple solution is given which ensures the gauge invariance. (5 refs.)

117369 Self-consistent spherically symmetric solutions of the Yang-Mills-Dirac-equations. M.Basler (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).
Z. Phys. C (Germany), vol.20, no.1, p.57-65 (1983).
The $SU(2)$ Yang-Mills equations coupled self-consistently to an isospin $^1/_2$-Dirac equation are studied. Static spherically symmetric exact analytic solutions are given. They all share the property of infinite energy. (27 refs.)

11.30 SYMMETRY AND CONSERVATION LAWS

(see also 02.20 Group theory)

117370 Symmetry and symmetry breaking in generalized parastatistics. R.Y.Levine, Y.Tomozawa (Dept. of Phys., Univ. of Michigan, Ann Arbor, MI, USA).
Ann. Phys. (USA), vol.149, no.2, p.457-81 (Sept. 1983).
An analysis is made of the characteristics of internal symmetry and symmetry breaking in a quantum field theory with generalized parastatistics, defined by either double commutation relations or single commutation relations. The connection between the two statistics is clarified. The authors develop a formalism in which statistics is viewed as a dynamical or phase variable of quantum systems. It is shown that the types of Higgs phases possible depend upon statistics. Relationships between physical amplitudes implied by internal symmetry with normal statistics are violated in the case of generalized parastatistics. (3 refs.)

117371 Standard model group: survival of the fittest. H.B.Nielsen (Niels Bohr Inst., Univ. of Copenhagen, Copenhagen, Denmark), N.Brene.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B224, no.3, p.396-402 (19 Sept. 1983).
The essential content of this paper is related to random dynamics. The author speculates that the work seen through a sub-Planck-scale microscope has a lattice structure and that the dynamics on this lattice is almost completely random, except for the requirement that the random (plaquette) action is invariant under some 'world (gauge) group'. It is seen that the randomness may lead to spontaneous symmetry breakdown in the vacuum (spontaneous collapse) without explicit appeal to any scalar field associated with the usual Higgs mechanism. It is further argued that the subgroup which survives as the end product of a possible chain of collapses is likely to have certain properties; the most important is that it has a topologically connected center. The standard group i.e. the group of the gauge theory which combines the Salam-Weinberg model with QCD, has this property. (6 refs.)

117372 Monopoles and fermion number violation. B.Sathiapalan, T.Tomaras (California Inst. of Technol., Pasadena, CA, USA).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B224, no.3, p.491-507 (19 Sept. 1983).
The Rubakov-Callan phenomenon is generalized to arbitrary fermion representations. The language of 'instanton physics' is used to describe the phenomenon. An argument for the enhancement (in the presence of a monopole) of the violation of anomaly free low-energy symmetries like baryon number is given. The importance of gauge field configurations with half-integral winding numbers is discussed. The case of fermions in the isovector representation is calculated explicitly. (14 refs.)

117373 The multi-fold commutator of variation of potential in chiral model and SDYM field. Ge Mo-lin, Wang Jun-yu (Lanzhou Univ., Lanzhou, China), Wu Yong-shi.
Commun. Theor. Phys. (China), vol.2, no.3, p.1099-106 (1983).
The multi-fold commutator representation of hidden symmetry algebra in principal chiral models and the self-dual Yang-Mills field is explicitly shown. All the variations are taken with respect to the potential A_ξ other than the field quantity g for principal chiral models in defining the usual operator $Q(\xi,\eta)$ to give the G⊗C(t) algebra. (13 refs.)

117374 Irreducible representations of superalgebras B(1,1) and B(0,2). Han Qi-zhi, Sun Hong-zhou (Dept. of Phys., Peking Univ., Peking, China).
Commun. Theor. Phys. (China), vol.2, no.3, p.1137-44 (1983).
In gauge supersymmetry and supersymmetry of nuclei one often meets the superalgebra osp(m/2n). The authors construct all the finite-dimensional irreducible representations of osp(3/2)=B(1,1) and osp(1/4)=B(0,2). The conditions of grade star representations are discussed. Only a part of finite-dimensional irreducible representations of B(1,1) and B(0,2) are grade star representations. These are different from those of B(0,1). (6 refs.)

117375 Fermi-Bose similarity, supersymmetry and generalised numbers. II. Y.Ohnuki (Dept. of Phys., Nagoya Univ., Nagoya, Japan), S.Kamefuchi.
Nuovo Cimento A (Italy), vol.77A, ser.2, no.1, p.99-119 (1 Sept. 1983).
For pt.I see ibid., vol.70, no.4, p.435-59 (1982). The study of generalized of g-numbers is continued in connection mainly with their analytical properties. The notion of the standard form of functions of g-numbers is redefined in a simpler form. Fourier and its inverse transformations are discussed in detail, and delta-functions are defined. It is thereby seen that in many respects g-numbers behave in a way very similar to ordinary, i.e. complex and Grassmann numbers. (5 refs.)

117376 CP violation in K→3π decays. H.-Ya.Cheng (Dept. of Phys., Purdue Univ., West Lafayette, IN, USA).
Phys. Lett. B (Netherlands), vol.129B, no.5, p.357-62 (29 Sept. 1983).
CP-violating effects in $K\to 3\pi$ decays are calculated in a miliweak model, the Weinberg model of CP nonconservation, and are then compared with the results obtained in the Kobayashi-Maskawa model. (22 refs.)

117377 The action principle in superspace. S.P.Misra, T.Pattnaik (Inst. of Phys., Bhubaneswar, India).
Phys. Lett. B (Netherlands), vol.129B, no.6, p.401-4 (6 Oct. 1983).
The authors consider here Schwinger's action principle in superspace and obtain a canonical quantisation for the supervariables. They see that this can be defined in a simple and unambiguous manner with boson and fermion quantisations occurring in one 'packet' when they consider superspace and suitably generalise the action principle. (8 refs.)

117378 Ground-state wave-function 'representation'. E.Gozzi (Dept. of Phys., City Univ. of New York, New York, NY, USA).
Phys. Lett. B (Netherlands), vol.129B, no.6, p.432-6 (6 Oct. 1983).
Starting from a general quantum mechanical system: $H=-{}^1/_2\partial^2/\partial x+U(x)$, the author shows its vacuum-vacuum correlation functions can be derived from a supersymmetric Hamiltonian with superpotential $V=-\ln\psi_0$, where ψ_0 is the ground-state wave function of H. (3 refs.)

117379 Experimental signals for supersymmetric decays of the W and Z bosons. A.H.Chamseddine, P.Nath (Dept. of Phys., Northeastern Univ., Boston, MA, USA), R.Arnowitt.
Phys. Lett. B (Netherlands), vol.129B, no.6, p.445-50 (6 Oct. 1983).
A model independent analysis of the particle spectrum and the interaction vertices of supergravity GUT models is given. The analysis interpolates between the models which produce SU(2)×U(1) breaking at the tree level and those where SU(2)×U(1) is broken dynamically from renormalization group loop corrections. General relations for wino and zino masses are obtained. The decays of W and Z into photino, wino and zino modes and their branching ratios in various leptonic and hadronic channels are discussed for theories which possess a light photino. (9 refs.)

117380 W decay in supergravity GUTs. D.A.Dicus, S.Nandi, X.Tata (Center for Particle Theory, Univ. of Texas, Austin, TX, USA).
Phys. Lett. B (Netherlands), vol.129B, no.6, p.451-5 (6 Oct. 1983).
The authors discuss the decay of the W-boson into supersymmetric particles and the decays of these particles in a unified theory in which gravity breaks $SU_L(2)\times U(1)$. If the decay $W\rightarrow\tilde{W}\tilde{Z}$ is kinematically possible, the subsequent decay of the gauginos may provide a definitive signature for supersymmetry. (14 refs.)

117381 Rare kaon processes as a probe of the top quark and gravitino masses on local supersymmetric (SUSY) theories. A.B.Lahanas, D.V.Nanopoulos (CERN, Geneva, Switzerland).
Phys. Lett. B (Netherlands), vol.129B, no.6, p.461-8 (6 Oct. 1983).
A detailed analysis of the rare K processes in local SUSY theories is given. The top quark mass cannot be much higher than O(100 GeV) without making the gravitino mass lower than O(20 GeV), its present lower bound in local SUSY theories from PETRA and PEP. (22 refs.)

117382 Lifting scalar-quark and -lepton masses with sideways U(1). J.F.McCabe, T.Matsuki, W.W.Wada (Dept. of Phys., Ohio State Univ., Columbus, OH, USA).
Phys. Rev. D (USA), vol.28, no.7, p.1738-44 (1 Oct. 1983).
The authors investigate a model for generating large masses for the scalar partners of the quarks and leptons for supersymmetric SU(5). The gauge group is extended to have sideways U(1) which breaks supersymmetry by the O'Raifeartaigh mechanism and generates scalar masses radiatively, while keeping the fermionic-mass corrections small. An explicit one-loop calculation of the scalar-mass corrections is carried out. For this $SU(5)\otimes U(1)$ model a light scalar partner of the leptons on either the second or the third generation is predicted by anomaly constraints. (18 refs.)

11.40 CURRENTS AND THEIR PROPERTIES

117383 Strong radiative corrections to strangeness-changing processes in the presence of right-handed currents. I.I.Bigi (Inst. fur Theoretische Phys., RWTH Aachen, Aachen, Germany), J.-M.Frere.
Phys. Lett. B (Netherlands), vol.129B, no.6, p.469-72 (6 Oct. 1983).
In the presence of weak right-handed currents the GIM suppression becomes less efficient in the effective $\Delta S=2$ operator. Therefore new features arise and have to be taken into account when applying strong radiative corrections. The authors determine these QCD corrections to the $\Delta S=2$ operator on the leading log level and (in contrast to the standard model) find a sizeable enhancement. If one ascribes *CP* violation to the presence of right-handed currents, then the parameter ϵ will enjoy the same enhancement. They shows however, that ϵ' is increased in a similar way; the ratio ϵ'/ϵ is therefore not significantly affected. (7 refs.)

12.00 SPECIFIC THEORIES AND INTERACTION MODELS; PARTICLE SYSTEMATICS

12.10 UNIFIED FIELD THEORIES AND MODELS

117384 Issues in the standard model. M.K.Gaillard (Fermi Nat. Lab., Batavia, IL, USA).
AIP Conf. Proc. (USA), no.102, p.54-67 (1983). (Theoretical Symposium on Intense Medium Energy Sources of Strangeness, Santa Cruz, CA, USA, 18-21 March 1983).
Focusing on the standard electroweak model, the author examines physics issues which may be addressed with the help of intense beams of strange particles. (29 refs.)

117385 Calculating $|\epsilon'/\epsilon|$ in $SU(2)_L\times SU(2)_R\times U(1)$ gauge models. G.C.Branco (Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
AIP Conf. Proc. (USA), no.102, p.94-8 (1983). (Theoretical Symposium on Intense Medium Energy Sources of Strangeness, Santa Cruz, CA, USA, 18-21 March 1983).
A calculation of the $|\epsilon\ 2n/\epsilon|$ ratio in electroweak models based on $SU(2)_L\times SU(2)_R\times U(1)$ is presented. The authors shows that there is a class of theories where $|\epsilon'/\epsilon|$ is either vanishing or very small ($|\epsilon'/\epsilon|\approx 10^{-4}$). From the known strength of CP violation in the neutral kaon system, the author obtains a constraint on the mass of the righthanded gauge boson: $M_{W(R)}{}^2\approx 10^5 M_{W(L)}{}^2$. (12 refs.)

117386 Left-right symmetry and CP violation. R.N.Mohapatra (Univ. of Maryland, College Park, MD, USA), G.Senjanovic.
AIP Conf. Proc. (USA), no.102, p.99-106 (1983). (Theoretical Symposium on Intense Medium Energy Sources of Strangeness, Santa Cruz, CA, USA, 18-21 March 1983).
A review of left-right symmetry and its possible connection to CP-violation is presented. The author also summarizes the experimental situation regarding M_R, the mass scale of parity restoration and discuss the general features of quark mass matrices in these theories. (17 refs.)

117387 CP-violation through Higgs exchange. N.G.Deshpande (Dept. of Phys., Univ. of Oregon, Eugene, OR, USA).
AIP Conf. Proc. (USA), no.102, p.107-13 (1983). (Theoretical Symposium on Intense Medium Energy Sources of Strangeness, Santa Cruz, CA, USA, 18-21 March 1983).
The author reviews the Weinberg model of CP nonconcservation through the exchange of Higgs bosons. When possible long distance contribution to K-$\bar{K}$ mass matrix are included, the model is barely compatible with the limit for ϵ'/ϵ obtained from experiment. The author also discusses the electric dipole moment (e.d.m.) of the neutron in this model. (17 refs.)

117388 On the strong CP problem in theories with several Higgs doubles and in supersymmetric models. I.I.Bigi (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).
AIP Conf. Proc. (USA), no.102, p.115-18 (1983). (Theoretical Symposium on Intense Medium Energy Sources of Strangeness, Santa Cruz, CA, USA, 18-21 March 1983).
The author discusses CP violation in supersymmetric models with Higgs doublets. A solution is considered up to a seven loop level and a detailed computation made in the Weinberg ansatz. (12 refs.)

117389 CP-violation in supersymmetric theories. M.B.Gavela (Brandeis Univ., Waltham, MA, USA).
AIP Conf. Proc. (USA), no.102, p.119-22 (1983). (Theoretical Symposium on Intense Medium Energy Sources of Strangeness, Santa Cruz, CA, USA, 18-21 March 1983).
The author discusses sources of CP violation specific to supersymmetric theories. CP-violating phases may appear: (a) in the mass matrices of the gauge and Higgs fermions: (b) in the mixing between the scalar quarks; (c) in the gauge coupling (revisit of the supersymmetric version of the Kobayashi-Maskawa model). The author estimates its effect on the electric dipole moment of the electron and the neutron. In some cases, it is found to be close to the experimental upper bounds. (10 refs.)

117390 Rare K and μ decays: theoretical and experimental status and prospects. G.L.Kane (Phys. Dept., Univ. of Michigan, Ann Arbor, MI, USA), R.E.Shrock.
AIP Conf. Proc. (USA), no.102, p.123-54 (1983). (Theoretical Symposium on Intense Medium Energy Sources of Strangeness, Santa Cruz, CA, USA, 18-21 March 1983).
The authors discuss occurrence of rare decays and how these affect the standard unified model. (87 refs.)

117391 Hyperron decays and a limit on left-right mixing. J.M.Frere (Randall Lab. of Phys., Univ. of michigan, Ann Arbor, MI, USA), I.I.Bigi.
AIP Conf. Proc. (USA), no.102, p.163-4 (1983). (Theoretical Symposium on Intense Medium Energy Sources of Strangeness, Santa Cruz, CA, USA, 18-21 March 1983).
Left-right symmetrical models, based on the group $SU(2)_L \times SU(2)_R \times U(1)$ have often been discussed as a somewhat minimal extension of the standard group $SU(2)_L \times U(1)$. As far as low-energy charged current gauge interactions are concerned, a need to introduce two new parameters, namely the mass of the hypothetical right-handfed boson, M_R and its mixing with the left-handed boson, characterized by $\sin\xi$ which lead respectively to effective (V+A) $(V+A).G_F/\sqrt{2}.M_L{}^2/M_R{}^2$ and $(V+A)(V-A).G_F/$ 3t2.$\sin\xi$ four-fermion interactions. The authors have suggested that a Majorana mass-independent limit on ξ be obtained by considering deep inelastic $\bar{\nu}$ scattering at large values of x and y. (2 refs.)

117392 Neutrino physics with intense beams. B.Kayser (Nat. Sci. Found., Washington, DC, USA), S.P.Rosen.
AIP Conf. Proc. (USA), no.102, p.165-9 (1983). (Theoretical Symposium on Intense Medium Energy Sources of Strangeness, Santa Cruz, CA, USA, 18-21 March 1983).
Intense, low-energy neutrino beams would make possible a variety of interesting experimental tests of the standard model. A number of these tests are described. (11 refs.)

117393 Theoretical perspectives on strange physics. J.Ellis (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).
AIP Conf. Proc. (USA), no.102, p.191-23 (1983). (Theoretical Symposium on Intense Medium Energy Sources of Strangeness, Santa Cruz, CA, USA, 18-21 March 1983).
The author discusses various unification models and their respective theoretical ideas. The K^0-$\bar{K}^0$ system is considered as a possible test of quantum theory. The future exploration of strange physics is discussed. (107 refs.)

117394 Monopolonium. C.T.Hill (Fermi Nat. Accelerator Lab., Batavia, IL, USA).
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B224, no.3, p.469-90 (19 Sept. 1983).
The author examines the general properties of a monopole anti-monopole bound state. Lifetimes grow as the cure of the initial diameter and range, for an SU(5) GUT monopole with mass$=2\times10^{16}$ GeV, from about 43 days for $d=1$ fm, to 10^{11} years for $d=0.1$ angstrom. He finds about 10^7 hadrons are produced by fragmentation of gluons are radiated by classical Larmor radiation. In the final burst when the extended cores overlap about 25 fundamental degrees of freedom of the full unified gauge group are produced. He finds that such objects would have been produced in the early universe at about the time of helium synthesis and their decay products and Larmor radiation may be observable. (12 refs.)

117395 One possibility of extension of the symmetry group of the Weinberg-Salam model. II. The experimental data analysis. S.F.Sultanov.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.1, p.67-71 (1983). In Russian.
Restrictions on the mass and coupling constants of *X*-bosons introduced in the framework of the extended symmetry of the electroweak interaction, and following from the experimental data on leptonic processes, have been found. (8 refs.)

117396 Asymmetries in $e^+e^- \rightarrow \gamma, Z_1{}^0, Z_2{}^0 \ldots \rightarrow \Sigma_q q\bar{q} \rightarrow 2$ jets due to neutral-current effects in the standard and extended gauge models. M.Hayashi, K.Katsuura (Dept. of Phys., Saitama Medical Coll., Saitama, Japan), S.Homma.
Nuovo Cimento A (Italy), vol.76A, ser.2, no.3, p.509-24 (1 Aug. 1983).
The authors study various observables (total cross-section, forward-backward asymmetry, asymmetry due to beam polarization, etc.) in which the neutral-current effects manifest themselves in the reaction $e^+e^- \rightarrow \gamma, Z_1{}^0, Z_2{}^0 \ldots \rightarrow \Sigma_q q\bar{q} \rightarrow 2$ jets induced by (longitudinally and transversely) polarized as well as unpolarized e^+e^- beams. They evaluate these quantities and investigate the effects of the beam polarizations in the energy range GeV $10 \lesssim \sqrt{8} \lesssim 200$ GeV adopting as the gauge models for the electroweak interaction the Weinberg-Salam model, the ones based on $SU_2 \times U_1 \times [U_1]'$ and on $SU_2 \times U_1 \times [SU_2]'$. They point out that at ~60 GeV (a typical energy at TRISTAN) the measurement of the forward-backward asymmetry for down-quarks $A_{FB}{}^d$ by longitudinally polarized beams can be useful in testing the models. At ~160 GeV (a typical energy at LEP) the measurements of the energy dependence of various asymmetries together with the one of the total cross-section using different polarized beams can clearly test the models. (12 refs.)

117397 A softly broken SUSY SU(5) GUT with no light supersymmetric partners, and massive superspace. K.T.Mahanthappa, G.M.Staebler (Dept. of Phys., Univ. of Colorado, Boulder, CO, USA).
Phys. Lett. B (Netherlands), vol.129B, no.5, p.298-302 (29 Sept. 1983).
A softly broken supersymmetric grand unified theory based on SU(5) with no light superpartners is constructed. The model does not involve fine tuning and gives rise to a stable hierarchy. The choice of mass parameters is dictated by the massive superspace. All superpartners of ordinary particles have masses $\gtrsim 10^{11}$ GeV. The proton decay proceeds via dimension-5 operators and is mediated by squarks, sleptons, shiggses and gaugions leading to a lifetime $>10^{32}$ yr. The cosmological constant is zero. (10 refs.)

117398 Fractional charges, monopoles and peculiar photons in SO(18) GUT models. Fang-xiao Dong, Tung-sleng Tu, Pei-yun Xue, Xyan-jian Zhou (Inst. of High Energy Phys., Acad. Sinica, Beijing, China).
Phys. Lett. B (Netherlands), vol.129B, no.6, p.405-10 (6 Oct. 1983).
Some SO(18) GUT models are proposed with can accommodate fractional charged color singlets with ordinary charge $\pm e/2$ and a monopole with ordinary magnetic charge $1/2e$. The models are consistent with the Dirac quantisation rule and peculiar photons appear. Future experimental tests of the peculiar photons are discussed. The models can also accommodate four or six generations of ordinary quarks and leptons. (9 refs.)

117399 The independence of mass scales in inverse hierarchy models. R.A.Flores (Det. of Phys., Univ. of California, Santa Cruz, CA, USA), M.Sher.
Phys. Lett. B (Netherlands), vol.129B, no.6, p.411-13 (6 Oct. 1983).
In inverse hierarchy models, one attempts to 'solve' the hierarchy problem by generating a large scale *X* from a theory with only a smaller scale *M*. Einhorn and Jones have argued (1983), however, that *M* and *X* are essentially independent scales, even though the ratio appears to be calculable. The authors consider a model in which the same phenomenon occurs, and show that it is identical to the more familiar near-Coleman-Weinberg' models. As the latter clearly have two independent scales, one put in by hand and the other generated by dimensional transmutation, they argue that inverse hierarchy models also have two independent scales, thus agreeing with the more detailed analysis of Einhorn and Jones. (4 refs.)

117400 Natural generation of fermion masses. S.Dimopoulos (Dept. of Phys., Stanford Univ., Stanford, CA, USA).
Phys. Lett. B (Netherlands), vol.129B, no.6, p.417-28 (6 Oct. 1983).
A class of grand unified theories is proposed in which the quark and lepton mass matrices are computed in terms of 4 input parameters via elementary group theory. These theories do not contain any small Yukawa couplings. The author works out several examples; some models agree with experiment to better than 30%; several theories predict surprisingly long b→c lifetimes; a favored value of the top quark mass is 6 times the bottom mass. Naturalness arguments strongly suggest the existence of a fourth generation at the weak scale. (13 refs.)

117401 Constraints on proton lifetime and $\sin^2\theta_W$ in SO(10) grand unified theory. Y.Tosa, G.C.Branco, R.E.Marshak (Dept. of Phys., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
Phys. Rev. D (USA), vol.28, no.7, p.1731-7 (1 Oct. 1983).
Simple constraints on the proton-decay lifetime are derived in SO(10) grand unified theory for major descents to the standard group $SU(3)_C \times SU(2)_L \times U(1)_Y$. It is shown that the only unambiguous pattern of symmetry breaking that predicts a longer proton lifetime [than SU(5)] goes through the Pati-Salam group $SU(4) \times SU(2)_L \times SU(2)_R$ and distinguishes quarks from leptons [i.e. SU(4) breaks down to $SU(3)_C \times U(1)_{B-L}$] before parity is broken [i.e. $SU(2)_R$ is broken]. The lifetime depends on M_R [the mass scale associated with $SU(2)_R$ breaking] but neither on the other intermediate mass scales nor on $\sin^2\theta_W$ in the limit where Higgs-boson contributions are neglected. 12.20 MODELS OF ELECTROMAGNETIC INTERACTIONS

117402 Relativistic spin-dependent Compton scattering from electrons. G.Bhatt, H.Grotch, E.Kazes (Dept. of Phys., Pennsylvania State Univ., University Park, PA, USA), D.A.Owen.
Phys. Rev. A (USA), vol.28, no.4, p.2195-200 (Oct. 1983).
The differential cross section for photon scattering from relativistic polarized free electrons in motion is derived. The calculation extends early results from electrons at rest. It is argued that the present derivation is required for use in bound-state spin-dependent Compton scattering from polarized electrons. The results provide an alternative check on recent work carried out using a quasirelativistic Hamiltonian. (14 refs.)

12.20D Specific calculations and limits of quantum electrodynamics

117403 Electromagnetic Casimir densities in dielectric spherical media. I.Brevik, H.Kolbenstvedt.
Ann. Phys. (USA), vol.149, no.2, p.237-53 (Sept. 1983).
Local expectation values of the electromagnetic energy density, and of the quantity $^1/_4G^2={}^1/_2(\mathbf{H}.\mathbf{B}-\mathbf{E}.\mathbf{D})$, are calculated both inside and outside a spherical surface dividing two media of permeabilities μ_1 and μ_2. In both media the relationship $\epsilon\mu=1$ is assumed, where ϵ is the permittivity. The powerful source theory method is used. The results are displayed graphically, although analytical approximate expressions for the field densities are obtained near the surface. The formalism is general enough to describe QED and QCD cavities (to zeroth order in the gauge coupling constant) on the same footing, as limiting cases. Retaining the cutoff parameter at a finite value, it is finally shown how the large interior and exterior cutoff terms compensate each other in the global Casimir energy. (19 refs.)

117404 de Sitter QED. B.Binegar, C.Fronsdal, W.Heidenreich (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).
Ann. Phys. (USA), vol.149, no.2, p.254-72 (Sept. 1983).
Attention is called to the fact that the well-known and straightforward generalization of electrodynamics to de Sitter space is incompatible with conformal invariance. In addition, there is difficulty in reconciling the space of one-photon states in de Sitter QED, for which the field carried no degree of freedom related to helicity, with that of flat space QED in which both signs of the helicity appear. The requirement of conformal invariance leads to the introduction of two vector potentials in de Sitter electrodynamics and resolves the helicity problem. A conformally-invariant indefinite metric quantization is carried out, and the nature of the flat space limit is clarified. Implications for a theory of composite massless particles are discussed, as well as applications to supersymmetry and supergravity. (12 refs.)

117405 The quantum electrodynamics in a constant magnetic field—the perturbation theory in Furry picture. Song Yu (Inst. of High Energy Phys., Acad. Sinica, Peking, China).
Commun. Theor. Phys. (China), vol.2, no.3, p.1081-97 (1983).
The second quantization in Furry picture is carried out, the perturbation theory is built up and a new method for investigating the electromagnetic phenomena in a constant magnetic field is proposed. Since the treatment of this method is exact, it is especially suitable for very high magnetic fields. (3 refs.)

117406 The photon in pseudoclassical mechanics. A.Barducci (Dept. de Phys. Theorique, Univ. de Geneve, Geneve, Switzerland), L.Lusanna.
Nuovo Cimento A (Italy), vol.77A, ser.2, no.1, p.39-75 (1 Sept. 1983).
The authors describe a massless particle belonging to the $D_{1,0}\oplus D_{0,1}$ representation of $SL_{2,c}$ by means of pseudoclassical mechanics, starting by a set of first-class constraints. By canonical quantization one obtains the one-photon wave functions in the Lorentz gauge, whereas by path integral quantization one finds the noncovariant transverse free propagator. In the reduced phase space, the canonical variables are manifestly covariant only under $O_2\otimes R^4$ and can be quantized by using the Angelopoulos-Bayen-Flato operators. By means of a distribution function ρ on the Grassmann variables the authors obtain the description of a classical ray of light with the associated Stokes parameters. The quantization of ρ gives the quantum Stokes parameters. (57 refs.)

12.30 MODELS OF WEAK INTERACTIONS

117407 Testing the standard model versus left-right models on the off the *Z* resonance. V.Barger (Dept. of Phys., Univ. of Durham, Durham, England), E.Ma, K.Whisnant.
Phys. Rev. D (USA), vol.28, no.7, p.1618-27 (1 Oct. 1983).
The authors examine the high-energy predictions of left-right models which are consistent with constraints from low-energy data. These are compared to the predictions of the standard electroweak gauge model to determine how well the theories can be distinguished by measurements in this mass region of the standard Z boson resonance. They find a nontrivial class of left-right models in which the lowest-mass Z is indistiguishable in mass and fermion couplings from the standard Z, but which allow a second Z boson as low as 200 GeV. They discuss the sensitivity of the lower limit on the second-Z mass to the results of the atomic parity-violation measurement and find that the newest data relaxes, the mass limit in a general left-right model to $M_{Z2}\gtrsim 150$ GeV. (34 refs.)

117408 Su(2)×U(1) neutral currents from SU(3)×U(1). M.Singer, K.S.Viswanathan (Dept. of Phys., Simon Fraser Univ., Burnaby, BC, Canada).
Phys. Rev. D (USA), vol.28, no.7, p.1721-30 (1 Oct. 1983).
A simple $SU(3)_L\times U(1)$ model of weak-electromagnetic interactions in which there is one new neutral-current parameter R_1 is shown to give the/$SU(2)_L\times U(1)$ muon-neutrino and electron neutral-current predictions for all values of R_1. For R_1 of the order 1, one of the two neutral gauge bosons is lighter than the charge gauge boson. By changing the charge assignments on the original model, one can also construct a new set of models which reproduces the muon-neutrino neutral currents, and gives predictions for electron neutral-current interactions which are consistent with experiment. (30 refs.)

117409 Evolution condition for electroweak interactions in composite models. P.Chen, F.M.Renard (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).
Phys. Rev. D (USA), vol.28, no.7, p.1758-69 (1 Oct. 1983).
The authors impose the requirement of good-high-energy behavior of $f\bar{f}\rightarrow W^+W^-$ scattering amplitudes for effective theory of electroweak interactions in composite models. They find that there exists a set of constraints on the form factors which they call the 'evolution condition' and which any such theory should obey. According to this condition the elecromagnetic and weak interactions are 'unified' in a less stringent way than by the so-called 'unification condition'. In addition, the effective theory should have a well defined evolution governed by the constraints on the form factors. The authors have checked this condition on several γ-W mixing schemes. Possible experimental tests are discussed. (18 refs.)

12.35 COMPOSITE MODELS OF PARTICLES

117410 Family symmetries. F.Wilczek (Inst. for Theoretical Phys., Univ. of California, Santa Barbara, CA, USA).
AIP Conf. Proc. (USA), no.102, p.68-72 (1983). (Theoretical Symposium on Intense Medium Energy Sources of Strangeness, Santa Cruz, CA, USA, 18-21 March 1983).
Advantages to theories with spontaneous breakdown of flavor symmetries are reviewed. A possible experimental signature in rare K-decays is discussed. One particularly attractive breakdown scheme is pointed out, and its consequences for mixing angles described. Recent ideas concerning axions, and their possible cosmological significance, are briefly discussed. The relevance of Cavendish-type experiments in testing for axions and familons is mentioned. (4 refs.)

$K\rightarrow\pi$+light pseudoscalar .... See Entry 117456

12.35C General properties of quantum chromodynamics (dynamics, confinement, etc.)

117411 Quarks, partons and quantum chromodynamics. J.Chyla (Fyzikalni Ustav CSAV, Praha, Czechoslovakia).
Cesk. Cas. Fyz. Sekce A (Czechoslovakia), vol.33, no.4, p.321-51 (1983). In Czech.
Contains a detailed exposition of the basics of perturbative quantum chromodynamics and a discussion of its relation to the parton model of hadrons. (23 refs.)

117412 On a non-perturbative approach to quantum chromodynamics. S.Olejnik (Fyzikalny Ustav CEFV SAV, Bratislava, Czechoslovakia).
Cesk. Cas. Fyz. Sekce A (Czechoslovakia), vol.33, no.4, p.352-72 (1983). In Czech.
Explains in detail results of a Feynman's work in which reasons for the confinement of quarks and for a non-zero mass of the lowest-lying excitations of a simplified planar model of chromodynamics were quantitatively shown. It also contains a brief review of some other non-perturbative approaches to the quantum chromodynamics. (25 refs.)

117413 Testing QCD at the proton-antiproton collider. W.Furmanski (LPTHE, Orsay, France), H.Kowalski.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B224, no.3, p.523-36 (19 Sept. 1983).
The recent UA1 and UA2 data for large-p_T jet production are compared with the predictions of perturbative QCD. Using the standard leading log QCD formula and neglecting all corrections (higher orders, higher twists), the authors find a good agreement with the UA1 data. On the other hand, the UA2 data are below their predictions. The theoretical uncertaintities due to the value of Λ and to the detailed shape of the gluon distribution are within the experimental errors of the UA1 data. (15 refs.)

117414 Deconfining and chiral phase transitions in quantum chromodynamics at finite temperature. T.Banks (Inst. for Theoretical Phys., Stanford Univ., Stanford, CA, USA), A.Ukawa.
Nucl. Phys. B, Field Theory & Stat. Syst. (Netherlands), vol.B225(FS9), no.1, p.145-55 (3 Oct. 1983).
The authors give further arguments to support the claim of Svetsky and Yaffe that the finite-temperature transition in 4-dimensional SU(N) gauge theories is in the universality class of 3-dimensional Z_N spin models. They show that this implies a smoothing out of the transition when quarks are added to the system as long as $N\neq 3$. For $N=3$ the pure gauge transition is expected to be first order and will be smoothed by quarks only if the quark contribution to the internal energy is larger than the latent heat of transition. (23 refs.)

117415 Pionic corrections and mulit-quark bags. P.J.Mulders (Center for Theoretical Phys., MIT, Cambridge, MA, USA), A.W.Thomas.
J. Phys. G (GB), vol.9, no.10, p.1159-67 (Oct. 1983).
The authors investigate the influence of pionic corrections on multi-quark hadrons. After determining the bag parameters from ordinary baryons and mesons, they discuss the implications for six-quark configurations. (34 refs.)

117416 Renormalization of the two-gluon exchange contributions to high-temperature interquark potential. Zhao Wanyun (Internat. School for Advanced Studies, Trieste, Italy).
Nuovo Cimento A (Italy), vol.76A, ser.2, no.3, p.525-38 (1 Aug. 1983).
The renormalization of the two-gluon contributions to high-temperature interquark potential within the framework of perturbation theory has been studied. The result is that the quarks are unconfined at high temperature, which is consistent with the Monte Carlo study of lattice gauge theory at high temperature. The infra-red problem is also discussed. (9 refs.)

117417 Fermion mass generation and electroweak symmetry breaking from colour forces. G.Zoupanos (CERN, Geneva, Switzerland).
Phys. Lett. B (Netherlands), vol.129B, no.5, p.315-19 (29 Sept. 1983).
The colour gauge group is extended to $SU(3)\otimes SU(3)$ and is subsequently broken to diagonal $SU(3)_c$. Under the diagonal $SU(3)_c$ the fundamental fermionic constituents of the larger strong group become ordinary quarks plus new quarks with exotic quantum numbers. Chiral symmetry breaking in the exotic quark sector may occur at much larger mass scales than ordinary chiral symmetry breaking, and could produce dynamical breaking of electroweak gauge symmetry and radiative masses for the light fermions. (17 refs.)

117418 A new method for fermion Monte Carlo. G.Bhanot, U.M.Heller (Inst. for Advanced Study, Princeton, NJ, USA), I.O.Stamatescu.
Phys. Lett. B (Netherlands), vol.129B, no.6, p.440-4 (6 Oct. 1983).
The authors suggest a new method using boson fields to compute the ratio of two determinants. The advantages of this method over others described in the literature are outlined. Some studies of the use of the method in two- and four-dimensional QCD with the gauge group SU(2) on small lattices are presented. (12 refs.)

117419 Critical coupling constants in chiral-symmetry breaking. A.Amer, A.Le Yaouanc, L.Oliver, O.Pene, J.-C.Raynal (Lab. de Phys., Theorique et Hautes Energies, Univ. Paris-Sud, Orsay, France).
Phys. Rev. D (USA), vol.28, no.6, p.1530-6 (15 Sept. 1983).
Finger, Horn, and Mandula showed in a Tamm-Dancoff approximation in QCD that Coulomb exchange induces instability of the chiral-invariant vacuum for $\alpha_5>\alpha_s{}^{\mathrm{crit}}$ in the sense that for $\alpha_s>\alpha_s{}^{\mathrm{crit}}$ there are negative eigenvalues of an operator H derived by them. The authors show that another critical coupling constant $\alpha_s{}^{\prime\mathrm{crit}}>\alpha_s{}^{\mathrm{crit}}$ is more meaningful. For $\alpha_s>\alpha_s{}^{\prime\mathrm{crit}}$ there is no positive self-adjoint extension of H; for $\alpha_s<\alpha_s{}^{\prime\mathrm{crit}}$ there is at least one; when $\alpha_s{}^{\mathrm{crit}}<\alpha_s<\alpha_s{}^{\prime\mathrm{crit}}$, among several self-adjoint extensions, a positive one is singled out by the physical requirement of a finite kinetic-energy expectation value. Considering, respectively, Coulomb exchange with the Tamm-Dancoff approximation, Coulomb exchange with the Bogoliubov-Valatin approximation, and Coulomb exchange plus transverse-gluon exchange, the values are ${}^4/_3\alpha_s{}^{\prime\mathrm{crit}}=8\pi/(4+\pi^2)$, $4/\pi$, $12/5\pi$ to be compared with ${}^4/_3\alpha_s{}^{\mathrm{crit}}={}^3/_2$, 1, $\pi/1(3\pi-4)$. 12.35E Applications of quantum chromodynamics to particle properties and reactions

117420 A lower bound on $|\epsilon'/\epsilon|$. J.S.Hagelin, F.J.Gilman (Stanford Linear Accelerator Center, Stanford Univ., Stanford, CA, USA).
AIP Conf. Proc. (USA), no.102, p.87-93 (1983). (Theoretical Symposium on Intense Medium Energy Sources of Strangeness, Santa Cruz, CA, USA, 18-21 March 1983).
In the Kobayashi-Maskawa (K-M) model, a lower bound on the CP violating product $s_2c_2s_3s_\delta$ follows from the imaginary part of the short-distance K^0-$\bar{K}^0$ mixing amplitude together with a conservative upper bound on the short distance contribution to $K_L \rightarrow \mu\mu$. This leads to a lower boundd on $|\epsilon'/\epsilon|$ in terms of a matrix element of a single $(V-A)\times(V+A)$ type operator. Familiar current algebra and bag model estimates for this matrix element give $|\epsilon'/\epsilon|>2\times10^{-3}$. The authors also observe that the experimental upper bound on the branching ratio for the b-quark into u-quarks fixes the sign of $s_2c_2s_3s_\delta$ and ϵ'/ϵ both to be positive. Allowances for QCD corrections and long distance effects are included throughout the analysis. (19 refs.)

117421 Dynamical interpretation of the technifermion approach motivated by composite gravity. H.Saller (Max-Planck-Inst. fur Phys. und Astrophys., Munich, Germany).
Nuovo Cimento A (Italy), vol.77A, ser.2, no.2, p.214-30 (21 Sept. 1983).
The algebraic connection of ordinary and technifermions by an extended technicolour group is reinterpreted as an analytic connection involving their dilatation properties. An embedding of the ordinary fermions into such a 'dilatation proliferation' is motivated by the conformal part of the gravitational interaction. Newton's constant (or the Planck mass) gives the scale for the interaction of the ordinary and technifermions in this extended scheme. The internal gauge bosons arise as composites. The mass splitting of the technifermions, appearing locally in parity doublets, is the relevant scale for the Higgs phenomenon. (12 refs.)

117422 The role helicity asymmetries could play in the search for supersymmetric interactions. N.S.Graigie (Internat. Centre for Theoretical Phys., Trieste, Italy), K.Hidaka, P.Ratcliffe.
Phys. Lett. B (Netherlands), vol.129B, no.5, p.310-14 (29 Sept. 1983).
The authors give the Born cross sections and polarization asymmetries for the supersymmetric version of QCD and describe how these could be exploited in the search for evidence of gluinos by establishing that missing energy events are indeed due to spin 1/2 particles. The interactions most relevant for collider energies are discussed. (6 refs.)

117423 The effect of confinement size on nuclear structure functions. F.E.Close, R.G.Roberts, G.G.Ross (Rutherford Appleton Lab., Didcot, England).
Phys. Lett. B (Netherlands), vol.129B, no.5, p.346-50 (29 Sept. 1983).
The authors consider the differences in the structure function of a heavy nucleus, such as iron, compared to a light nucleus. They investigate, in the context of QCD, a suggestion that these differences arise as a result of differences in the scale of confinement of the nuclear constituents. This results in a simple relationship between heavy and light nucleus structure functions which is in reasonable agreement with experiment if the confinement size in iron is around 10-20% greater than in a free nucleon. (11 refs.)

117424 Mesons wwith excited glue. L.A.Griffiths, C.Michael, P.E.L.Rakow (Dept. of Appl. Math. & Theoretical Phys., Univ. of Liverpool, Liverpool, England).
Phys. Lett. B (Netherlands), vol.129B, no.5, p.351-6 (29 Sept. 1983).
The potential function for all possible excitations of a gluonic string with fixed ends is extracted from lattice Monte Carlo calculations using a variational technique. The spectrum of mesonic states, including those with exotic J^{PC}, is presented. (8 refs.)

117425 Dimensionally regularized two-loop on-shell quark form factor. R.J.Gonsalves (Dept. of Phys. & Astron., State Univ. of New York, Amherst, NY, USA).
Phys. Rev. D (USA), vol.28, no.6, p.1542-9 (15 Sept. 1983).
Analytic results are presented for the dimensionally regularized two-loop Feynman diagrams which contribute to the electromagnetic form factor of an on-shell quark in massless quantum chromodynamics. (22 refs.)

117426 On the exponentiation of soft-gluon large corrections. A.P.Contogouris, L.Marleau (Dept. of Phys., McGill Univ., Montreal, Canada).
Phys. Rev. D (USA), vol.28, no.7, p.1644-58 (1 Oct. 1983).
For Drell-Yan dilepton production to order α_s^2 (two-loop level) in the dimensional-regularization approach the authors study the question of exponentiation of π^2 terms arising from soft-gluon perturbative corrections. (22 refs.)

117427 Two-gluino bound states and heavy quarkonium. J.Zuk, G.C.Joshi, J.W.G.Wignall (School of Phys., Univ. of Melbourne, Parkville, Victoria, Australia).
Phys. Rev. D (USA), vol.28, no.7, p.1706-15 (1 Oct. 1983).
A supersymmetric octet QCD, incorporating interacting gluons and gluinos, is formulated and used to discuss the features of two-gluino bound states. The short-range gluino-gluino potential is calculated and it is assumed that the complete potential, including the color-confining part, has the same form as the quark-antiquark potential but multiplied by the color factor derived for the short-range part. A spin-dependent mass formula based on a quark-antiquark potential of the Martin single-power type is fitted to the known triplet and singlet states of heavy quarkonia and is then used to make predictions of the mass spectra of ^3S, ^1P, and ^3D gluino-gluino bound states. It is found the relative energy spacings of these states are almost independent of gluino mass m_λ for $m_\lambda \gtrsim 5$ GeV, the experimental lower limit. (26 refs.)

117428 Quantum-chromodynamic potential model for light and heavy quarkonia. S.N.Gupta, S.F.Radford (Dept. of Phys., Wayne State Univ., Detroit, MI, USA), W.W.Repko.
Phys. Rev. D (USA), vol.28, no.7, p.1716-20 (1 Oct. 1983).
The authors' earlier treatment for the investigation of the $c\bar{c}$, $b\bar{b}$, and $t\bar{t}$ spectra is extended to other quarkonia with u, d, s, c, and b quarks. They find that it is possible to account fully for the observed ground-state hyperfine splittings of light as well as heavy quarkonia provided that the perturbative quantum-chromodynamic potential is supplemented not only by the nonperturbative confining potential but also by a nonperturbative annihilation potential which rapidly decreases with increase in the quark mass. They also give predictions for the experimentally interesting $b\bar{u}$, $b\bar{s}$, and $b\bar{c}$ systems with unknown mass splittings. (14 refs.)

117429 $\psi\psi$ production at collider energies. B.Humpert (Inst. de Phys. Nucleaire, Univ. de Lausanne, Lausanne, Switzerland), P.Mery.
Z. Phys. C (Germany), vol.20, no.1, p.83-93 (1983).
The authors estimate $\psi\psi$ production at collider energies in the framework of perturbative QCD. The $O(\alpha_s^2)-O(\alpha_s^4)$ parton cross-sections, with the non-relativistic approximation for the heavy quark bound states, are used. This first insight into the characteristics of the kinematical distributions allows predictions on the predominance of the quark, gluon or B meson production mechanisms in particular kinematical regions. 12.35H Phenomenological composite models of particle structure and reactions (partons, bags, etc.)

117430 An exactly solvable model for fermionic generations and Poincare stresses. W.Krolikowski (Inst. of Theoretical Phys., Warsaw Univ., Warsaw, Poland).
Acta Phys. Pol. B (Poland), vol.B14, no.9, p.689-705 (Sept. 1983).
An exactly solvable quantum mechanical model is presented to illustrate the conjecture that leptons and quarks of higher generations may arise as excited states of lepton and quark internal charge distribution kept stable by Poincare stresses. Excitations are then 'quasiphonons' related to internal oscillations around the equilibrium provided by joint action of these stresses and internal electromagnetic forces. The model leads to an exponentially growing mass spectrum proposed previously on the phenomenological ground (predicting toponium at about 40 GeV and the next charged lepton at 28.5 GeV). When perturbed in a natural way, the model is able to describe Cabibbo-like mixing of generations, and, in particular, to predict the off-diagonal elements of Kobayashi-Maskawa matrix. (6 refs.)

117431 Excited quarks and new hadronic states. F.M.Renard (CERN, Geneva, Switzerland).
Nuovo Cimento A (Italy), vol.77A, ser.2, no.1, p.1-20 (1 Sept. 1983).
Develops the phenomenology of excited quarks q*. The author describes the spectroscopy of new $q\bar{q}^*$ mesonic states and calculates the cross-sections of various production mechanisms in e^+e^-, $\gamma\gamma$, lepton-hadron and hadron-hadron collisions. (9 refs.)

117432 A fine- and hyperfine structure analysis of heavy quarkonia: $(b\bar{b})$- and (tt)-states. A.D.Steiger (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
Phys. Lett. B (Netherlands), vol.129B, no.5, p.335-40 (29 Sept. 1983).
The fine- and hyperfine structure of (bb)-states is analyzed in a spin-dependent one-parameter potential model. Since this model reproduces the observed masses and leptonic widths of the upsilon family with remarkable accuracy, it is used to predict properties of toponium for a recently suggested t-quark mass of 35 GeV. (17 refs.)

117433 Introduction to the chemistry of fractionally charged atoms: electronegativity. K.S.Lackner, G.Zweig (California Inst. of Technol., Pasadena, CA, USA).
Phys. Rev. D (USA), vol.28, no.7, p.1671-91 (1 Oct. 1983).
The behavior of massive fractionally charged particles in matter is governed by the laws of chemistry if electromagnetic interactions dominate at atomic distances. Chemical properties of such 'quark atoms' can be predicted by interpolating isoelectronic sequences. The properties of quark atoms lie between those of a neutral atom and an ion. Electronegativity helps in the qualitative understanding of quark chemistry. Electronegativities, together with ionzation potentials and electron affinities, are computed for the quark elements. The concepts of chemical analogy and isomorphism are introduced. Analogies based on shell structure and electronegativity are established. Many quark elements cannot be computed to a single ordinary element. They are chemical chimeras. An understanding of quark chemistry is essential for the design and interpretation of quark-search experiments. The impact of chemical reactions on quark impurities in matter can be monitored by observing the behavior of more abundant isomorphic control elements. Contrary to common belief, the chemical differences between a quark element and its ordinary counterpart are substantial. (64 refs.)

117434 Fit of the mixing angles in the six quark model and predictions on the *B* meson lifetime. K.Kleinknecht, B.Renk (Inst. fur Phys., Univ. Dortmund, Dortmund, Germany).
Z. Phys. C (Germany), vol.20, no.1, p.67-70 (1983).
Experimental data are used to constrain the parameters of the six quark mixing model and of a composite quark model. A combined fit of the mixing angles in the Kobayashi-Maskawa scheme gives $\sin\theta_1=0.228\pm0.011$ and error contours around the best values $\sin\theta_2=0.12$ and $\sin\theta_3\approx O$. From this, a limit of $\tau_B>0.35\times10^{-13}s$ for the mean lifetime of bottom-flavoured hadrons is obtained. For the composite quark model of Katsumata and Tomozawa, a value of $\tau_B=(0.22\text{-}0.23)10^{-13}s$ is derived. (17 refs.)

117435 Sub-leading contributions to the intrinsic charm of the nucleon. E.Hoffmann (Inst. fur Phys., Univ. Dortmund, Dortmund, Germany), R.Moore.
Z. Phys. C (Germany), vol.20, no.1, p.71-82 (1983).
The authors discuss corrections to the simple intrinsic charm model due to both quark and nucleon masses via ξ-scaling and mass-dependent radiative QCD contributions, and, in addition, take appropriate account of threshold effects. The recent EMC data are shown not to conflict with the basic idea of intrinsic charm but to suggest that a normalisation of 1% may overestimate the charge content of the nucleon; the large experimental uncertainties in x mean that the simple photon-gluon fusion mechanism alone cannot be ruled out. (18 refs.)

12.35K Other composite models

(inc. composite quarks and leptons)

117436 The quark mixing matrix in a composite model. H.Katsumata, Y.Tomozawa (Randall Lab. of Phys., Univ. of Michigan, Ann Arbor, MI, USA).
Ann. Phys. (USA), vol.149, no.2, p.273-85 (Sept. 1983).
The generalized mixing matrix of quarks is computed based on a composite model of quarks and leptons. Among potentials between constituent particles examined $V(r)=Ar^s$ ($As>0$) and A 1n r ($A>0$), it is shown that potentials with exponent $0\lesssim s\lesssim 3$ or in r are consistent with current experimental data for the mixing matrix elements. (12 refs.)

117437 A trouble for composite quark and lepton models?. Z.Y.Zhu (Inst. of Theoretical Phys., Acad. Sinica, Peking, China).
Commun. Theor. Phys. (China), vol.2, no.3, p.1165-8 (1983).
In composite quark and lepton models a factor which depends on the quark or lepton mass ratio appears in the effective weak coupling constant of quarks and leptons. It comes from the Lorentz contraction of the composite quark and lepton wave functions and may cause trouble for their weak coupling constant universality. (2 refs.)

117438 Effects of compositeness in deep inelastic scattering. R.Ruckl (Max-Planck-Inst. fur Phys. und Astrophys., Werner Heisenberg Inst. fur Phys., Munchen, Germany).
Phys. Lett. B (Netherlands), vol.129B, no.5, p.363-9 (29 Sept. 1983).
It is conjectured that leptons and quarks are composites of more fundamental constituents bound together by a new confining force with a typical confinement radius $\sim 1\Lambda_H$. Assuming that the effective low energy lagrangian is given by the lagrangian of the standard model plus induced lepton and quark current-current interactions, the effects of the latter remnants of the new force on the deep inelastic structure function, $F_2(x,Q^2)$, are investigated at $Q^2 \ll \Lambda_H{}^2$. It is shown that these signatures of compositeness should be detectable at HERA if $\Lambda_H \lesssim 2$-3 TeV. (7 refs.)

117439 Understanding of spin $^1/_2$, family structure, and mass pattern of leptons and quarks in a composite model. A.N.Mitra (Dept. of Phys., Univ. of Delhi, Delhi, India).
Phys. Rev. D (USA), vol.28, no.7, p.1745-57 (1 Oct. 1983).
A relativistic three-preon interaction with a spin dependence $\Sigma^a \equiv \sigma_{\mu\nu}{}^{(1)}\sigma_{\nu\lambda}{}^{(2)}\sigma_{\lambda\mu}{}^{(3)}$ is proposed for an SU(2) preon (t,v) model. The Σ^a operator (i) gives zero force for $S={}^3/_2$ states, thus rendering them dynamically irrelevant, and (ii) has the complex combinations $\chi'' \pm i\chi'$ of the two spin-$^2/_2$ functions (χ',χ'') as eigenstates with eigenvalues of opposite signs so that only one combination is relevant for confinement. This feature in turn leads to just three S_3-symmetry classes (out of six available ones) of spatial wave function, again in complex form which are sought to be identified with the generation structures. Their spatial functional forms are such as to obey severe selection rules preventing electromagnetic transitions such as $\mu \rightarrow e\gamma$. Apart from these qualitative features which are shown to remain valid within a fairly general (Bethe-Salpeter-type) dynamical framework, a quantitative model of confinement with a very steep potential ($\sim R^{12}$) is proposed for a unified description of lepton and quark spectra. This leads to a universal (l,q) mass formula for all three generations with only two free parameters, in rather good agreement with the observed pattern. In particular the lepton mass ratios which do not involve any free parameter are predicted as $m_\mu/m_e=196.7$ and $m_\tau/m_\mu=14.3$. (35 refs.)

12.40 MODELS OF STRONG INTERACTIONS

117440 Dual Feynman rules: topological asymptotic freedom. G.F.Chew, M.Levinson (Dept. of Phys., Univ. of California, Berkeley, CA, USA).
Z. Phys. C (Germany), vol.20, no.1, p.19-26 (1983).
Feynman-graph rules are formulated for the strong interaction components of the topological expansion, defined as those graphs all of whose vertices are zero entropy connected parts. These rules imply a 'topological asymptotic freedom' and admit a corresponding perturbative evaluation where the zeroth order exhibits topological supersymmetry. (17 refs.)

12.40E Statistical models

117441 Parton fragmentation and string dynamics. B.Andersson, G.Gustafson, G.Ingelman, T.Sjostrand (Dept. of Theoretical Phys., Univ. of Lund, Lund, Sweden).
Phys. Rep. (Netherlands), vol.97, no.2-3, p.31-145 (July 1983).
While much has been learned recently about quark and gluon interactions in the framework of perturbative quantum chromodynamics, the relation between calculated parton properties and observed hadron densities involves models where dynamics and jet empirical rules have to be combined. The authors describe a presently successful approach which is based on a cascade jet model using string dynamics. It can readily lead to Monte Carlo jet programmes of great use when analyzing data. Production processes in an iterative cascade approach, with tunneling in a constant force field are reviewed. Expected differences between quark and gluon jets are discussed. Low transverse momentum phenomena are also reviewed with emphasis on hyperon polarization. (116 refs.)

117442 Jet reconstruction in collider events using digital filtering. A.Donati, R.Odorico (Dipartimento di Fisica, Univ. di Bologna, Bologna, Italy), V.Roberto.
Z. Phys. C (Germany), vol.20, no.1, p.9-18 (1983).
Jet reconstruction in collider events is shown to be made more stable and faster by properly using, in a preliminary stage, information from the energy flow. The latter is processed through a Fourier digital filtering, which removes fluctuations without altering significant dynamical features. Statistical tests are presented indicating good reconstruction efficiency also for complex events. (8 refs.)

12.40H Duality and dual models

117443 Stochastic geometry of O_2 fermionic strings. S.Cecotti (Scuola Normale Superiore, Pisa, Italy).
Nuovo Cimento A (Italy), vol.76A, ser.2, no.4, p.627-44 (21 Aug. 1983).
Studies the O_2 fermionic string with Polyakov's methods. The author shows that the corresponding O_2 super-Liouville theory is equivalent to a classic stochastic system, i.e. possesses a local Nicolai mapping. This property may play a crucial role in the quantization of the model and its integrability. Bosonization gives a very deep insight in the nonperturbative structure of the model: Kosterlitz-Thouless realization of chirality, fractional charges, existence of a free massless field in the spectrum. These phenomena give a great interest to the problem of the supersymmetry fate. The model has some analogies with local supersymmetry (and, indeed, the original Lagrangian is locally supersymmetric); hence, the exotic aspects of the realization of (global) supersymmetry in the O_2 super-Liouville model seem relevant for a dynamical theory of local supersymmetry. (26 refs.)

117444 Classical string phenomenology. How strings work. X.Artru (Lab. de Phys. Theorique et Hautes Energies, Univ. de Paris-Sud, Orsay, France).
Phys. Rep. (Netherlands), vol.97, no.2-3, p.147-71 (July 1983).
The author considers the classical motion of free nonbaryonic (open or closed) strings, and presents the classical rules governing their interactions: cutting, rearrangement and fusion. These rules follow from causality and are given in terms of 'causality diamonds' or subsets of 'genes'. The yo-yo model, which incorporates massless partons in the strings, is also presented and studied. (25 refs.)

117445 Charge distribution in a two-chain dual model. K.Fialkowski (Inst. of Phys., Jagellonian Univ., Cracow, Poland), A.Kotanski.
Z. Phys. C (Germany), vol.20, no.1, p.1-4 (1983).
Charge distributions in the multiple production processes are analysed using the dual chain model. A parametrisation of charge distributions for single dual chains based on the νp and $\bar{\nu}p$ data is proposed. The rapidity charge distributions are then calculated for pp and $\bar{p}p$ collisions and compared with the previous calculations based on the recursive cascade model of single chains. The results differ at the SPS collider energies and in the energy dependence of the net forward charge supplying the useful tests of the dual chain model. (10 refs.)

12.40Q Potential models

117446 An analysis on the color Van der Waals force. Wang Fan (Nanjing Univ., Nanjing, China), He Yin, Zhuang Fei, Jin Xingnan.
Chin. J. Nucl. Phys. (USA), vol.5, no.3, p.263-72 (Aug. 1983). In Chinese.
Up to now approximate methods were used to discuss colour Van der Waals force (VdWf) of the confining potential model. The authors have derived a two-channel (colourless and hidden colour) coupled equation by which the long range nuclear interaction may be determined. By solving the equations they conclude that the r^a type confining potential would yield r^{a-4} type VdWf. But they find that the VdWf is caused by the coupling of highly excited energy levels of the relative motion between two coloured nucleons. Therefore it is possible to eliminate the spurious VdWf by rejecting these highly excited energy levels. They conclude that the confining potential model is still useful to the calculation of the hadron interaction and the dibaryon resonances. (12 refs.)

117447 Reggeized quark multiperipheral model for dual sheets. T.Kanki (Inst. of Phys., Osaka Univ., Osaka, Japan).
Prog. Theor. Phys. (Japan), vol.70, no.1, p.222-8 (July 1983).
Assuming that quarks are reggeized in QCD, the author discusses a quark-multiperipheral model as a possible model of the dual sheet. It is shown that the model reproduces the Lee-Veneziano relation and predicts the interesting result, $\alpha_M(0)-\alpha_B(0)\simeq{}^1/_2$. (9 refs.)

12.70 HADRON MASS FORMULAS

117448 Finite-energy sum rules and light-quark masses. A.L.Kataev, N.V.Krasnikov, A.A.Pivovarov (Inst. for Nuclear Res. of the Acad. of Sci., Moscow, USSR).
Nuovo Cimento A (Italy), vol.76A, ser.2, no.4, p.723-33 (21 Aug. 1983).
The light-quark masses are calculated on the basis of finite-energy sum rules. The result (m_u+m_d(1 GeV)$\simeq$20 MeV) allows one to estimate the ratio $m_b/m_s\sim20$ which should be compared with the prediction of the SU_5 model or grand unification $m_b/m_s=17$. The authors estimate a value of the π'-meson residue and propose a model for the π-meson radial excitation mass spectrum. In particular, they obtain a mass of the second π-meson excitation $m_\pi^2(2)=2m_{\pi'}^2$, in agreement with the experimental data. (26 refs.)

13.00 SPECIFIC REACTIONS AND PHENOMENOLOGY

117449 Current experiments in elementary particle physics. C.G.Wohl, F.E.Armstrong, A.Rittenberg, T.G.Trippe, G.P.Yost, L.Addis, P.Joos, Y.Oyanagi, D.C.Dodder, S.N.Grudtsin, Y.G.Ryabov, R.Frosch, A.Olin.
Report LBL-91 Revised, Univ. California, Lawrence Berkeley Lab., Berkeley, USA (March 1983), 38 pp. Contract DE-AC03-76SF00098.
This report contains summaries of 479 approved experiments in elementary particle physics (experiments that finished taking data before 1 January 1979 are excluded). There are experiments from Brookhaven, CERN, CESR, DESY, Fermilab, Tokyo Institute of Nuclear Studies, KEK, LAMPF, Serpukhov, SIN, SLAC, and TRIUMF, and also experiments on proton decay. Properties of the beams at most of the laboratories are summarized.

13.10 WEAK AND ELECTROMAGNETIC INTERACTIONS OF LEPTONS

117450 Neutral-current effects in the standard and extended gauge models for spin polarization effects in $e^+e^-\to\mu^+\mu^-$. M.Hayashi, K.Katsuura (Dept. of Phys., Saitama Medical Coll., Saitama, Japan), S.Homma.
Nuovo Cimento A (Italy), vol.77A, ser.2, no.1, p.76-98 (1 Sept. 1983).
The authors study various observables (the asymmetry due to the beam polarizations, the forward-backward asymmetry, etc.) in which the neutral-current effects appear in the reaction $e^+e^-\to\mu^+\mu^-$ induced by (longitudinally and transversely) polarized as well as unpolarized e^+e^- beams in combination with the measurements of the longitudinal polarization $P_L(\mu^-)$ of the outgoing muon(s). They carry out the numerical calculation for these quantities at TRISTAN and LEP energies, adopting as examples of the electroweak gauge models the standard Weinberg-Salam model, the ones based on $SU_2\times U_1\times[U_1]'$ and on $SU_2\times U_1\times[SU_2]'$. They argue that at TRISTAN energies the angular distribution of $P_L(\mu^-)$ measurable in the experiment by the polarized beams is especially useful for the purpose of distinguishing between the models. At LEP energy range the measurements of the angular distribution and the energy dependence of $P_L(\mu^-)$ using polarized beams, in addition to the measurement of the total cross-section, can determine the correct model if any. (17 refs.)

117451 Scattering of very light scalar particles, off leptons. B.R.Kim, C.Stamm (Tech. Hochschule Aachen, Aachen, Germany).
Z. Phys. C (Germany), vol.20, no.1, p.53-5 (1983).
Characteristic features of the scattering of light pseudoscalar and scalar particles are pointed out. The authors discuss how a light pseudoscalar particle might experimentally be distinguished from a light scalar particle. Further they give a method for determining the mass of the light pseudoscalar particle. (3 refs.)

13.15 NEUTRINO INTERACTIONS
(inc. interactions involving cosmic rays)

117452 On the feasibility of performing neutrino experiments at an intense source of strangeness. R.D.Carlini, G.J.Stephenson (Los Alamos Nat. Lab., Los Alamos, NM, USA).
AIP Conf. Proc. (USA), no.102, p.170-80 (1983). (Theoretical Symposium on Intense Medium Energy Sources of Strangeness, Santa Cruz, CA, USA, 18-21 March 1983).
Several very important low energy neutrino experiments have been identified and discussed by Kayser and Rosen in these proceedings. The authors address the possibility of performing some of these experiments in the environment of a kaon factory. To carry out specific analyses, they draw upon the design of existing BNL detectors, the design of experiments that are proposed for an 800 MeV proton driven facility at Los Alamos, and the use of the code NUBEAM developed at CERN. Since in most cases they have not optimized, this is a conservative estimate. They find that many of the desired experiments can be performed with facilities now under discussion. (7 refs.)

13.20 LEPTONIC AND SEMILEPTONIC DECAYS OF MESONS

117453 What limits a $K\to\pi\nu\bar{\nu}$ experiment? 2Q. R.E.Mischke (Meson Phys. Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
AIP Conf. Proc. (USA), no.102, p.185-7 (1983). (Theoretical Symposium on Intense Medium Energy Sources of Strangeness, Santa Cruz, CA, USA, 18-21 March 1983).
Experimental limitations regarding the serach for the decay $K\to\pi\nu\bar{\nu}$ are briefly reviewed. (9 refs.)

117454 Lepton mixing and heavy neutrinos. J.-M.Frere (Randall Lab. of Phys., Univ. of Michigan, Ann Arbor, MI, USA).
AIP Conf. Proc. (USA), no.102, p.189-90 (1983). (Theoretical Symposium on Intense Medium Energy Sources of Strangeness, Santa Cruz, CA, USA, 18-21 March 1983).
In view of the considerable interest displayed in experiments looking for $K\to e\nu_x$, $K\to\mu\nu_x$, where ν_x is a hypothetical heavy neutrino mixing with the electronic and/or muonic neutrino, the author comments on a more general (although less sensitive) approach to such mixings. (4 refs.)

117455 Experimental outlook [strangeness energy sources]. B.D.Winstein (Enrico Fermi Inst., Univ. of Chicago , Chicago, IL, USA).
AIP Conf. Proc. (USA), no.102, p.225-34 (1983). (Theoretical Symposium on Intense Medium Energy Sources of Strangeness, Santa Cruz, CA, USA, 18-21 March 1983).
A summary of the prospects for exploiting an intense medium energy source of strangeness is presented, particularly with regard to rare K decays and studies of CP nonconservation. The current status as well as new efforts at the existing laboratories are reviewed for some selected physics topics before possible future initiatives are considered. (35 refs.)

13.25 HADRONIC DECAYS OF MESONS

117456 $K\to\pi$+light pseudoscalar. J.-M.Frere (Randall Lab. of Phys., Univ. of Michigan, Ann Arbor, MI, USA).
AIP Conf. Proc. (USA), no.102, p.155-9 (1983). (Theoretical Symposium on Intense Medium Energy Sources of Strangeness, Santa Cruz, CA, USA, 18-21 March 1983).
The 'classical' or 'standard' axion now looks very dead. The author comments briefly on the present experimental situation, and envisages the sensitivity of the more general decay $K\to\pi$+light pseudoscalar, since such light particles might appear in a considerable number of models or theories (e.g. supersymmetry, technicolor ...). For this purpose, the author considers two cases: (i) the tree-level couplings of the pseudoscalar h is flavor-diagonal (axion-type) (ii) the tree-level coupling is not flavor diagonal (flavor changing neutral current). (5 refs.)

117457 What limits experiments in rare kaon decays: machines/beam lines or detectors?. D.E.Dorfan, F.-W.Sadronzinski (Univ. of California, Santa Cruz, CA, USA), W.C.Louis,III.
AIP Conf. Proc. (USA), no.102, p.181-4 (1983). (Theoretical Symposium on Intense Medium Energy Sources of Strangeness, Santa Cruz, CA, USA, 18-21 March 1983).
The authors discuss the possible experimental limits in the use of higher intensity kaon beams. (no refs.)

117458 Relativistic effects in heavy-quarkonium spectroscopy. R.McClary, N.Byers (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).
Phys. Rev. D (USA), vol.28, no.7, p.1692-705 (1 Oct. 1983).
It is shown that the discrepancy between the measured rate for $\psi'\to\chi_0\gamma$ and that predicted by nonrelativistic models can be accounted for by $(v/c)^2$ relativistic corrections. A Breit-Fermi Hamiltonian is used to predict the energy level structure and $E1$ transition rates in the charmonium and Υ systems. It is obtained from an instaneous approximation to a Bethe-Salpeter equation whose kernel is composed of Coulomb-gauge gluon exchange and a scalar confining piece. The model accounts for the observed fine and hyperfine structure of the charmonium levels and for the $E1$ transition rates. It is used to predict the level structure and $E1$ rates in the Υ system. it is shown that an extension of Siegert's theorem is valid in the relativistic regime. This result is useful in analyzing $E1$ transition-matrix elements. (21 refs.)

13.30 DECAYS OF BARYONS

117459 Electromagnetic corrections to semileptonic decays with a polarized emitted hyperon. A.Garcia (Dept. de Fisica, Inst. Politecnico Nacional, Mexico City, Mexico).
Phys. Rev. D (USA), vol.28, no.7, p.1659-63 (1 Oct. 1983).
The radiative corrections to the Dalitz plot of hyperon semileptonic decays when the recoil hyperon is polarized are studied. An expression for the transition probability that is suitable for high statistics experimental analysis is obtained. The model-dependent part of the radiative corrections is retained in general so that the results obtained are not limited to specific model calculations. The asymmetry coefficients are dealt with in the second part of this paper. (13 refs.)

117460 Further experimental test of nucleon charge conservation through the reaction ^{13}Cd$\rightarrow$^{113m}In+neutrals. A.Roy, S.C.Vaidya, D.C.Ephraim, V.M.Datar, K.S.Bhatki, S.K.Bhattacherjee (Tata Inst. of Fundamental Res., Bombay, India).
Phys. Rev. D (USA), vol.28, no.7, p.1770-2 (1 Oct. 1983).
A new experiment to search for the charge-nonconserving decay of a nucleon through the decay ^{113}Cd$\rightarrow$^{113m}In+neutrals has been performed employing the coincidence-detection technique between the *K*-conversion electrons and the *K* X-rays in ^{113m}In separated chemically from a bulk sample of $CdCl_2$. The measurement yields a lower limit on the mean life $\tau_N{}^{CNC} \geq 1.4 \times 10^{18}$ yr. (10 refs.)

13.35 DECAYS OF LEPTONS

117461 Two-photon decays of heavy neutrinos. J.F.Nieves (Dept. of Phys., Univ. of Puerto Rico, Rio Piedras, Puerto Rico).
Phys. Rev. D (USA), vol.28, no.7, p.1664-70 (1 Oct. 1983).
The process $\nu_1 \rightarrow \nu_2 + \gamma + \gamma$ is studied in detail. Formulas for the decay rate are given in the context of the SU(2)×U(1) model with massive neutrinos and it is shown that this process can dominate over $\nu_1 \rightarrow \nu_2 + \gamma$ for some range of values of $m_{\nu 1}$, depending on the relevant mixing angles. A general, model-independent analysis is also given with particular emphasis on the difference between the cases of Dirac and Majorana neutrinos. In particular, the author shows how the invariant amplitudes in the Majorana case can be expressed in terms of the amplitudes calculated as if the neutrinos were Dirac particles. (21 refs.)

117462 Angular correlations and the tau-neutrino mass. J.Babson, E.Ma (Dept. of Phys. & Astron., Univ. of Hawaii, Honolulu, HI, USA).
Z. Phys. C (Germany), vol.20, no.1, p.5-7 (1983).
Effects of a nonzero mass for the tau neutrino ν_τ as well as a right-handed charged-current contribution to the τ-ν_τ coupling are discussed. Angular correlations of the decay products of $\tau^+\tau^-$ in e^+e^- annihilation are calculated as functions of $m(\nu_\tau)$ and the relative amount of right-handed τ-ν_t coupling. (11 refs.)

Rare K and μ decays: theoretical and experimental status and prospects ....See Entry 117390

13.40 ELECTROMAGNETIC PROCESSES AND PROPERTIES

13.40F Electromagnetic form factors; electric and magnetic moments

117463 The hadron structure functions in the bag model and their modifications. Wang Xing-Min, Song Xiao-Tong (Dept. of Phys., Hangzhou Univ., Hangzhou, Zhejiang, China), Yin Peng-Cheng.
Hadronic J. (USA), vol.6, no.4, p.985-1010 (July 1983).
The authors calculate the structure functions of nucleons and mesons by using translation-invariant bag-quarks effective currents and an assumption of freedom-separation rules. The 4-momentum conservation is satisfied automatically in the authors' calculation, while the resultant structure functions have explicit Bjorken scaling, positive-definiteness and a suitable asymptotic behavior. A new counting rule is also obtained. Then Regge-correction terms are introduced to modify the valence quark distribution functions. The obtained functions seem to be in good agreement with the experimental curves. Finally, the seaquark distribution functions are calculated by use of Pomeron-correction terms, which, when the new counting rule is applied, seem to be well consistent with the data. (15 refs.)

117464 Corrections to weak structure functions of the nucleon in the region of intermediate values of *x*. J.Abad (Dept. de Fisica Teorica, Univ. de Zaragoza, Zaragoza, Spain).
Nuovo Cimento A (Italy), vol.77A, ser.2, no.2, p.184-96 (21 Sept. 1983).
The corrections of order $1/Q^2$ are calculated in the large-middle *x*-value region, by using a type of diagram that is assumed dominant in this region. The author shows the behaviour of these corrections and that these corrections fulfil the Callan-Gross relation $W_2 = (4x^2M^2/Q\mathrm{R}^2)W_1$ and the relation $W_2 = \xi W_3$. (6 refs.)

117465 Precision measurement of the magnetic moment of the Σ^- hyperon. D.W.Hertzog, M.Eckhause, K.L.Giovanetti, R.J.Kane, W.C.Phillips, W.F.Vulcan, R.E.Welsh, R.J.Whyley, R.G.Winter (Coll. of William & Mary, Williamsburg, VA, USA), G.W.Dodson, J.P.Miller, F.O'Brien, B.L.Roberts, D.R.Tieger, R.J.Powers, N.J.Colella, R.B.Sutton.
Phys. Rev. Lett. (USA), vol.51, no.13, p.1131-4 (26 Sept. 1983).
The magnetic moment of the Σ^- hyperon has been obtained from measurements of fine-structure splittings of X-ray transitions in Σ^- exotic atoms. The use of targets consisting of sheets of Pb or W immersed in liquid hydrogen, and of a tagging technique utilizing the π^+ emitted in the reaction $K^-p \rightarrow \Sigma^-\pi^+$, resulted in improved X-ray signal-to-noise ratio by a factor of 15 over that in previous experiments. The present result is $\mu(\Sigma^-) = (1.111 \pm 0.031 \pm 0.011)\mu_N$. (17 refs.)

117466 Proton and neutron magnetic moments from QCD sum rules. I.I.Balitsky, A.V.Yung (Leningrad Nuclear Phys. Inst., Leningrad, USSR).
Phys. Lett. B (Netherlands), vol.129B, no.5, p.328-34 (29 Sept. 1983).
The proton and neutron magnetic moments are calculated within QCD using sum rules with bilocal power corrections accounted for. (20 refs.)

13.40H Electromagnetic decays

117467 Radiative decays of charmonium and constituent quark masses. Kuang-Ta Chao (Dept. of Phys., Peking Univ., Peking, China).
Commun. Theor. Phys. (China), vol.2, no.3, p.1129-35 (1983).
The problems of both E1 and M1 transitions of charmonium are discussed in the nonrelativistic potential model. It is found these that problems could be resolved by assuming larger constituent quark masses. With $m_c = 2.50$ GeV, $m_b = 5.84$ GeV in the typical linear plus Coulomb potential model the author gets satisfactory results for the mass spectra, the E1 and M1 transition rates, and the relative values of leptonic widths for the ψ and Υ families. The implication of the large constituent quark masses is also discussed. (10 refs.)

117468 Decays of the pseudoscalar mesons. S.N.Banerjee, R.K.Das (Dept. of Phys., Jadavpur Univ., Calcutta, India).
Hadronic J. (USA), vol.6, no.4, p.956-70 (July 1983).
Electromagnetic and hadronic decay widths of the pseudoscalar mesons have been investigated with the pion wavefunction as input from the statistical model, into the usual Van Royen-Weisskopf formula and its modified version. For the $\eta \rightarrow \gamma\gamma$ decay, the authors' computed results for the electromagnetic decay widths for $\pi^0 \rightarrow \gamma\gamma$ and $\eta' \rightarrow \gamma\gamma$ processes compare favourably with the corresponding experimental findings and the hadronic decay widths agree reasonably well with the only existing theoretical estimates. (13 refs.)

117469 A relativistic version of the statistical model for one meson. S.N.Banerjee, R.Saha (Dept. of Phys., Jadavpur Univ., Calcutta, India).
Hadronic J. (USA), vol.6, no.4, p.971-84 (July 1983).
A relativistic version of the statistical model of one meson has been developed, which yields an analytical form of the square modulus of the mesonic wavefunction. In the massless quark limit, it assumes an extremely simple form. Using this form as an input, the pionic decay constant and the decay width for the $\pi^0 \rightarrow 2\gamma$ process have been calculated. Close agreement with the corresponding experimental findings has been achieved. (13 refs.)

117470 Electromagnetic decays of vector and axial mesons $\rho \rightarrow \pi + l^+ + l^-$ and $A_1 \rightarrow \pi + l^+ + l^-$. M.P.Rekalo.
Ukr. Fiz. Zh. (USSR), vol.28, no.9, p.1308-13 (Sept. 1983). In Russian.
The angular and energy distributions of radiative decay products have been studied for decays of vector and axial mesons, $V \rightarrow \pi + l^+ + l^-$ and $A \rightarrow \pi + l^+ + l^-$, taking into account one-spin particle polarization. P-odd effects in $V \rightarrow \pi + l^+ + l^-$ decays, when *P*-invariance is violated in the electromagnetic vertex $V \rightarrow \pi + \gamma$ must be essentially intensified in the kinematic region where a virtual γ-quantum 3-impulse is small. The methods of differentiation of the *P*-noninvariance mechanism in pi-meson production and the *P*-noninvariance mechanism in the V-meson decays are discussed. (11 refs.)

117471 Search for light penetrating bosons with the use of a rotatable detector arrangement at a nuclear reactor. H.R.Kock, O.W.B.Schult, H.Seyfarth (Inst. fur Kernphys., KFA Julich, Julich, Germany), H.Bechteler, R.Yogeshwar.
Z. Phys. A (Germany), vol.313, no.3, p.239-40 (1983).
The search for the two-photon decay of light penetrating bosons (axions or others), produced in a nuclear reactor, was supplemented by measurements with a rotatable set-up at the Julich 10 MW research reactor FRJ-1. Measurements were performed in 'effect' and 'background' positions, the latter not allowing the simultaneous detection of both photons due to decay kinematics. Preliminary measurements, carried out at reactor ON condition only, show no positive effect. (8 refs.)

13.60 PHOTON AND CHARGED-LEPTON INTERACTIONS WITH HADRONS

(for neutrino interactions, see 13.15)

117472 Leptoquark production at HERA. S.Chadha, J.Proudfoot, D.H.Saxon.
Report RL-83-071, Rutherford Appleton Lab., Chilton, Oxon., England (Aug. 1983), 40 pp.
Considers the production and properties of the leptoquark states, (predicted by technicolour theories) at the HERA ep colliding-beam facility. It is found that useful event signatures can be obtained and that, using a reasonable charged-current detector, mass peaks can be reconstructed. For likely event rates, sufficient background suppression is obtained to permit observation of these states. (13 refs.)

Excited quarks and new hadronic states ....See Entry 117431

Jet production and fragmentation ....See Entry 117479

13.60F Elastic and Compton scattering

117473 New measurement of deep-inelastic *e-p* asymmetries. G.Baum, M.R.Bergstrom, P.R.Bolton, J.E.Clendenin, N.R.DeBotton, S.K.Dhawan, Y.-N.Guo, V.-R.Harsh, V.W.Hughes, M.S.Lubell, Z.-L.Mao, R.H.Miller, S.Miyashita, K.Morimoto, U.F.Moser, I.Nakano, R.F.Oppenheim, D.A.Palmer, L.Panda, W.Raith, N.Sasao, K.P.Schuler, M.L.Seely, P.A.Souder, S.J.St. Lorant, K.Takikawa, M.Werlen (Inst. of High Energy Phys., Beijing, China).
Phys. Rev. Lett. (USA), vol.51, no.13, p.1135-8 (26 Sept. 1983).
Spin-dependent asymmetries have been measured in inclusive deep-inelastic scattering of longitudinally polarized electrons by longitudinally polarized protons. Data were obtained at a scattering angle of 10° and for incident energies of 16.2 and 22.7 GeV, which cover the kinematic range $0.18 < x < 0.70$ and $3.5 < Q^2 < 10.0$ $(\mathrm{GeV}/c)^2$. The present results provide a test of scaling and

of the Bjorken and Ellis-Jaffe sum rules and are compared with various models of proton spin structure. (27 refs.)

13.60K Meson production

117474 Calculation of weak neutral currents by the electro-production of pions on nucleons close to the nucleon resonances in the parton-quark model. F.S.Sadykhov, K.A.Petrosyan, R.I.Mikailov.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.1, p.99-104 (1983). In Russian.
Considers the process of the electroproduction of pions on nucleons close to the nucleon resonance range taking into account weak neutral currents in the parton-quark model. Using the angular distribution and the dependence of the cross section on the transmission of momentum constants of quark and gluon interactions, the contribution of weak neutral currents to the degree of polarization has been obtained. (11 refs.)

117475 Direct electromagnetic excitation $N \rightarrow \Delta(1232)$, final-state interactions, and the multipoles $M_{1+}^{(3/2)}$ and $E_{1+}^{(3/2)}$ of photopion production of nucleons in the range $160 \lesssim E_\gamma \lesssim 800$ MeV. A.Jurewicz (Istituto di Fisica 'G. Marconi', Univ. Degli Studi, Roma, Italy).
Phys. Rev. D (USA), vol.28, no.7, p.1604-17 (1 Oct. 1983).
In this paper one of the classics of particle theory in the resonance region is reexamined, namely the prediction of the amplitudes $M_{1+}^{(3/2)}$ and $E_{1+}^{(3/2)}$ of photopion production on nucleons around the resonance $\Delta(1232)$. The tool employed for this purpose is the final-state-interaction theory, and the principal aim of the study is to advocate for the appearance of two distinct dynamical mechanisms of photoexcitation in such an approach. Special emphasis is put on the naturally emerging links between the present treatment and the isobaric approach and calculations based on the static quark model. It is argued that the dynamical meaning of the troublesome arbitrary constants can be very convincingly explained when the resonances formed in the reaction [$\Delta(1232)$ in this specific case] are treated as 'elementary' objects represented in the T-matrix elements by singularities of the Castillejo-Dalitz-Dyson kind. In the case discussed here, 'direct' magnetic-dipole excitation $N \rightarrow \Delta(1232)$ seems to emerge very clearly as an independent dynamical mechanism of photoproduction in the p_{33} state, parallel to the usual electromagnetic excitation of nonresonant πN systems, both followed by resonant pion-nucleon rescattering. It turns out that the magnitude of such direct $\gamma N \Delta$ coupling is completely determined by the related strong interactions. The necessity of allowing for both specified mechanisms in this and other similar calculations is emphasized. (44 refs.)

13.60P Baryon and baryon resonance production

117476 Deuteron photodisintegration. I. Theory and results at low energies. W.-Y.P.Hwang, J.T.Londergan, G.E.Walker (Dept. of Phys., Indiana Univ., Bloomington, IN, USA).
Ann. Phys. (USA), vol.149, no.2, p.335-73 (Sept. 1983).
The authors extend the 'elementary-particle treatment' of deuteron electrodisintegration at small excitation energies, as developed by Hwang, Henlen, and Miller (1981), by incorporating more (np)-scattering states so that dueteron disintegration by low-energy photons can also be investigated. The nucleon-only impulse approximation (NOIA), as modified to incorporate gauge invariance (GI), is assumed to be valid only in the Breit frame, in which the initial and final nuclear systems are treated symmetrically. The matrix element of the electromagnetic current is thus determined in the Breit frame and then transformed into the CM frame. In addition, the difference between the resultant NOIA/GI and the NOIA is determined explicitly in every channel. Numerical results are obtained for the Reid soft-core potential with extensions required for $J>2$ scattering states. It is found that there is no substantial discrepancy between the $\theta_p=0°$ data of Hughes et al. (1976) and the prediction of this formalism. General features of this formalism, including angular distributions at low energies, are discussed in quantitative terms. (32 refs.)

117477 The general structure of polarization characteristics in deuteron electrodsintegration. M.P.Rekalo, G.I.Gakh, A.P.Rekalo.
Ukr. Fiz. Zh. (USSR), vol.28, no.9, p.1313-18 (Sept. 1983). In Russian.
The differential cross-section of the deuteron electrodisintegration $e^- + d \rightarrow e^- + n + p$ (with the detection of two final particles) is found to depend on the polarization states of colliding particles. The general case of deuteron vector and tensor polarizations has been considered. The dependence of all symmetries of the angular proton distributions in $e^- + d \rightarrow e^- + n + p$ (caused by electron and deuteron polarizations) on two kinematic variables (azimuthal angle ϕ and parameter κ—the degree of virtual photon linear polarization) has been predicted taking into account the hadron electromagnetic current conservation and P-invariance of the hadron electromagnetic interactions. The general structure of the proton polarization in the $e^- + d \rightarrow e^- + n + p$ reaction has been found. (14 refs.)

Direct electromagnetic excitation $N \rightarrow \Delta(1232)$, final-state interactions, and the multipoles $M_{1+}^{(3/2)}$ and $E_{1+}^{(3/2)}$ of photopion production of nucleons in the range $160 \lesssim E_\gamma \lesssim 800$ MeV ....See Entry 117475

13.65 HADRON PRODUCTION BY ELECTRON-POSITRON COLLISIONS

117478 A measurement of $e^+e^- \rightarrow \bar{p}p$ for $(1975 \leq \sqrt{s} \leq 2250)$ MeV. D.Bisello, S.Limentani, M.Nigro, L.Pescara, M.Posocco, P.Sartori (Istituto di Fisica, Univ. Padova, Padova, Italy), J.E.Augustin, G.Busetto, G.Cosme, F.Couchot, B.Dudelzak, P.Eschstruth, F.Fulda, B.Grelaud, G.Grosdidier, B.Jean-Marie, S.Jullian, D.Lalanne, V.Lepeltier, C.Paulot, R.Riskalla, P.Roy, F.Rumpf, L.Stanco, G.Szklarz, R.Baldini, G.Capon.
Nucl. Phys. B, Part. Phys. (Netherlands), vol.B224, no.3, p.379-95 (19 Sept. 1983).
The $e^+e^- \rightarrow \bar{p}p$ cross section has been measured in the energy interval $(1975 \leq 2E \leq 2250)$ MeV for $|\cos\theta| < 0.7$. The measurement is based on ~100 events, thus improving by a factor 3 on the previous existing statistics in this energy interval. The form factor $|G|^2$ is given as a function of energy under the assumption $|G_E| = |G_M|$. The authors also give the first measurement of the differential cross section, averaged over the energy interval, and estimate the ratio $|G_M|/|G_E|$ from it. (16 refs.)

117479 Jet production and fragmentation. G.Wolf (DESY, Hamburg, Germany).
Hadronic J. (USA), vol.6, no.4, p.853-934 (July 1983).
Jets produced by hard constituent scattering are clearly observed in e^+e^- annihilation, deep inelastic lepton nucleon scattering and large p_T hadron hadron scattering. Amongst the most exciting results are the direct measurement of the parton-parton scattering angular distribution and the observation of very energetic jets at the SPS collider. QCD provides a consistent description for the underlying constituent scattering processes. The particle composition observed indicate similar fragmentation properties of quarks and gluons in e^+e^- annihilation and lepton nucleon scattering. (94 refs.)

117480 Production of charmed mesons in e^+e^- annihilation at 10.5 GeV. P.Avery, C.Bebek, K.Berkelman, D.G.Cassel, J.W.DeWire, R.Ehrlich, T.Ferguson, R.Galik, M.G.D.Gilchriese, B.Gittelman, M.Halling, D.L.Hartill, .Herrup,D., S.Holzner, M.Ito, J.Kandaswamy, V.Kistiakowsky, D.L.Kreinick, Y.Kubota, N.B.Mistry, E.Nordberg, M.Ogg, R.Perchonok, R.Plunkett, A.Silverman, P.C.Stein, S.Stone, D.Weber, R.Wilcke (Cornell Univ., Ithaca, NY, USA), A.J.Sadoff, R.Giles, J.Hassard, M.Hempstead, K.Kinoshita, W.W.MacKay, F.M.Pipkin, R.Wilson, T.Jensen, H.Kagan, S.Behrends, K.Chadwick, J.Chauveau, P.Ganci, T.Gentile, J.M.Guida, J.A.Guida, R.Kass, A.C.Melissinos, S.L.Olsen, G.Parkhurst, D.Peterson, R.Poling, C.Rosenfeld, G.Rucinski, E.H.Thorndike, P.Tipton, J.Green, R.G.Hicks, F.Sannes, P.Skubic, A.Snyder, R.Stone, A.Chen, M.Goldberg, N.Horwitz, A.Jawahery, P.Lipari, G.C.Moneti, C.G.Trahern, H.Van Hecke, M.S.Alam, S.E.Csorna, L.Garren, M.D.Mestayer, R.S.Panvini, Xia Yi.
Phys. Rev. Lett. (USA), vol.51, no.13, p.1139-42 (26 Sept. 1983).
A measurement is presented of the inclusive production of charged D^* and neutral D mesons from nonresonant e^+e^- annihilation in the energy region near the $\Upsilon(4S)$ resonance. The momentum distribution shows a large contribution at high momenta as expected for heavy quark production. Comparison of the spectrum with several phenomenological models is made. The relative yields of the D^* and D mesons indicate that the charm cross section is dominated by the D^* contribution. (12 refs.)

117481 Observation of baryons in *B*-meson decay. M.S.Alam, S.E.Csorna, L.Garren, M.D.Mestayer, R.S.Panvini, Xia Yi (Vanderbilt Univ., Nashville, TN, USA), Giles R., J.Hassard, M.Hempstead, K.Kinoshita, W.W.MacKay, F.M.Pipkin, R.Wilson, H.Kagan, P.Avery, C.Bebek, K.Berkelman, D.G.Cassel, J.W.DeWire, R.Ehrlich, T.Ferguson, R.Galik, M.G.D.Gilchriese, B.Gittelman, M.Halling, D.L.Hartill, D.Herrup, S.Holzner, M.Ito, J.Kandaswamy, V.Kistiakowsky, D.L.Kreinick, Y.Kubota, N.B.Mistry, F.Morrow, E.Nordberg, M.Ogg, R.Perchonok, R.Plunkett, A.Silverman, P.C.Stein, S.Stone, D.Weber, R.Wilcke, A.J.Sadoff, S.Behrends, K.Chadwick, J.Chauveau, P.Canci, T.Gentile, J.M.Guida, J.A.Guida, R.Kass, A.C.Melissinos, S.L.Olsen, G.Parkhurst, D.Peterson, R.Poling, C.Rosenfeld, G.Rucinski, E.H.Thorndike, P.Tipton, J.Green, R.G.Hicks, F.Sannes, P.Skubic, A.Snyder, R.Stone, A.Chen, M.Goldberg, N.Horwitz, A.Jawahery, P.Lipari, G.C.Moneti, C.G.Trahern, H.van Hecke.
Phys. Rev. Lett. (USA), vol.51, no.13, p.1143-6 (26 Sept. 1983).
In a sample of B mesons from the decay of the $\Upsilon(4S)$ produced in e^+e^- collisions at the Cornell Electron Storage Ring, inclusive protons, antiprotons, lambdas, and antilambdas have been observed. Lower limits to the B-to-baryon branching ratios are derived. (14 refs.)

117482 Inclusive D and D^* production in e^+e^- annihilation at 29 GeV. S.Ahlen, C.Akerlof, G.Baranko, P.Baringer, I.Beltrami, D.Bender, D.Blockus, B.Brabson, J.Chapman, Y.Cho, S.T.Chui, B.Cork, R.DeBonte, M.Derrick, S.Ems, D.Errede, E.Fernandez, G.E.Forden, R.Fries, K.K.Gan, G.Gieraltowski, S.W.Gray, J.-P.Guillaud, N.Harnew, L.Hyman, K.Jaeger, L.Keller, P.Kesten, R.Klem, D.Koltick, P.Kooijman, S.Kooijman, F.Loeffler, J.S.Loos, F.LoPinto, U.Mallik, R.McIlwain, D.I.Meyer, D.H.Miller, B.Musgrave, H.Neal, C.R.Ng, D.Nitz, H.Ogren, P.P.Ong, L.E.Price, L.K.Rangan, D.Rubin, D.Rust, J.Schlereth, P.Schreiner, A.A.Seidl, E.I.Shibata, R.Singer, P.Smith, R.Stevens, R.Thun, T.Trinko, M.Valdata-Nappi, J.Va'vra, L.T.Wang, C.Ward, J.M.Weiss, M.Willutzky, R.J.Wilson, D.E.Wood (Argonne Nat. Lab., Argonne, IL, USA).
Phys. Rev. Lett. (USA), vol.51, no.13, p.1147-50 (26 Sept. 1983).
Inclusive production of $(D^0, \bar{D}^0)$ and $D^\pm$ mesons have been observed in e^+e^- annihilation at 29 GeV. The signals correspond to R values of $R(D^0+\bar{D}^0)=3.25 \pm 1.2$ and $R(D^+ + D^-)=1.35 \pm 0.6$. $D^{*\pm}$ production is also observed via the process $D^{*+} \rightarrow D^0\pi^+$ and its charge conjugate. The D and D^* production rates are compared. (15 refs.)

117483 Broken supersymmetric QCD and e^+e^- hadronic cross sections. G.Altarelli, B.Mele (Dipartimento di Fisica, Univ. 'La Sapienza', Rome, Italy), R.Petronzio.
Phys. Lett. B (Netherlands), vol.129B, no.6, p.456-60 (6 Oct. 1983).
Effects of broken supersymmetry on some exclusive and the total inclusive e^+e^- hadronic cross sections are studied. In particular, the first-order QCD correction to $R_{e^+e^-}$ from s-quark and gluino effects is computed and discussed with particular emphasis on the energy interval below the threshold for production of a pair of s-quarks and on the limit of infinite energies. (10 refs.)

Asymmetries in $e^+e^- \rightarrow \gamma, Z_1^0, Z_2^0 \ldots \rightarrow \Sigma_q q\bar{q} \rightarrow 2$ jets due to neutral-current effects in the standard and extended gauge models ....See Entry 117396

117484 Parametrisation of hadron inclusive cross sections in p-p collisions extended to very low energies. L.C.Tan, L.K.Ng (Phys. Dept., Univ. of Hong Kong, Hong Kong).
J. Phys. G (GB), vol.9, no.10, p.1289-308 (Oct. 1983).
To parametrise the inclusive differential cross sections of charged hadrons produced in p-p collisions at the CMS energy, $\sqrt{s} \lesssim 10$ GeV, where the radial-scaling limit is not reached, a new variable $x_T = T^*/T^*_{max}$ is introduced, where T^* is the kinetic energy of a hadron produced in the CMS. The ratio of the low-energy inclusive differential cross section to that of its corresponding radial-scaling limit is found to be explicitly independent of p_t and approaches unity monotonically and quickly from above for increasing $\sqrt{s}$. The authors have succeeded in parametrising the inclusive differential cross sections for hadrons including $\pi^\pm$, $\kappa^\pm$, p and $\bar{p}$, and the expressions obtained are applicable at energies from the ISR down to those near the production thresholds. (35 refs.)

117485 Dibaryon resonance and aligned coupling states of nucleon and Δ isobar. T.Otofuji, K.Sakai (Dept. of Phys., Nagoya Univ., Nagoya, Japan), H.Kanada, S.Saito, M.Yasuno.
Prog. Theor. Phys. (Japan), vol.70, no.1, p.322-5 (July 1983).
The resonance-like behaviors observed in the NN scattering are investigated with the channel coupling between NN and NΔ. The dominant role of the aligned coupling states of the NΔ system is made clear. It is essential to give rise to the resonancelike behaviors that the intermediate NΔ state is unstable and have large inelasticity. (11 refs.)

117486 Extension of the soft-photon theorem for bremsstrahlung. G.E.Bohannon (Carnegie Software, Redondo Beach, CA, USA), L.Heller.
Phys. Rev. Lett. (USA), vol.51, no.13, p.1151-4 (26 Sept. 1983).
A correction to the soft-photon theorem for bremsstrahlung is derived for problems in which the strong interaction is known at large distances. In studies of a model problem the correction generally results in significant improvement in accuracy over the original theorem. (9 refs.)

Charge distribution in a two-chain dual model ....See Entry 117445

13.75G Pion-baryon interactions (energy ≤ 10 GeV)

117487 Study of the reactions $\pi^- p \to \pi^- \Delta^+$ and $\pi^- p \to \pi^0 \Delta^{++}$ at high energies. Fazal-e-Aleem, M.Saleem (Dept. of Phys., Punjab Univ., Lahore, Pakistan), I.E.Qureshi.
Hadronic J. (USA), vol.6, no.4, p.1040-7 (July 1983).
The differential cross section for the reaction $\pi^- p \to \pi^0 \Delta^+$, including the recent results for large angle cross sections at 5 GeV/c have been fitted by using the simple Regge pole model with phenomenological residue functions. The SU(2) invariance at the vertices has been used to determine $^{d\sigma}/_{dt}$ for the process $\pi^- p \to \pi^0 \Delta^{++}$. (7 refs.)

117488 Measurement of low-energy elastic $\pi^\pm p$ differential cross sections. J.S.Frank, A.A.Browman, P.A.M.Gram, R.H.Heffner, K.A.Klare, R.E.Mischke, D.C.Moir, D.E.Nagle, J.M.Potter, R.P.Redwine, M.A.Yates (Los Alamos Nat. Lab., Los Alamos, NM, USA).
Phys. Rev. D (USA), vol.28, no.7, p.1569-85 (1 Oct. 1983).
The authors have measured differential cross sections for both $\pi^+ p$ and $\pi^- p$ elastic scattering at incident-pion kinetic energies of 30, 50, 70, and 90 MeV in the center-of-mass angular range between 50° and 150°. The experiment detected pions scattered from a liquid-hydrogen target with multiwire proportional chambers and scintillation-counter range telescopes. The relative accuracy of each angular distribution is better than 5%, while the absolute cross sections have uncertainties of 4% to 25%. The results for the absolute cross section for $\pi^+ p$ scattering at 30 and 90 MeV are inconsistent with previous measurements. The $\pi^- p$ measurements comprise the first extensive set of precision differential cross sections below 90 MeV. (10 refs.)

117489 Study of π-π scattering amplitudes in the reaction $\pi^+ p \to \Delta^{++} \pi^0 \pi^0$ at 8.0 GeV. N.M.Cason, P.E.Cannata, A.E.Baumbaugh, J.M.Bishop, N.N.Biswas, L.J.Dauwe, V.P.Kenney, R.C.Ruchti, W.D.Shephard (Univ. of Notre Dame, Notre Dame, IN, USA), J.M.Watson.
Phys. Rev. D (USA), vol.28, no.7, p.1586-600 (1 Oct. 1983).
An experiment studying the reaction $\pi^+ p \to \Delta^{++} \pi^0 \pi^0$ using the Argonne National Laboratory 1.5-m streamer chamber combined with a lead-glass hodoscope is described. The data were analyzed in terms of $\pi^+ \pi^- \to \pi^0 \pi^0$ scattering, and the details of the extrapolation to the pole are discussed. An energy-independent amplitude analysis from threshold to 2.3 GeV is presented. In this analysis the $f^0(1270)$, the $h^0(2040)$, and a $J^P = 2^+$ state at 1.8 GeV with a width of 0.280 GeV are observed. The amplitude ambiguity arising from analyses of $\pi^+ \pi^- \to \pi^+ \pi^-$ data in the 1.6 GeV region is resolved. An energy-dependent phase-shift analysis from 1.0 to 1.5 GeV is presented. (36 refs.)

Study of the reaction $\pi^- p \to K^0 \Lambda^0$ ....See Entry 117493

13.75J Kaon-baryon interactions (energy ≤ 10 GeV)

117490 A study of the reaction $K^- p \to \phi \Lambda$ at 4.2 GeV/c. M.Kamran (Phys. Dept., Punjab Univ., Lahore, Pakistan).
Commun. Theor. Phys. (China), vol.2, no.3, p.1121-7 (1983).
The high statistics differential cross-section, polarisation and density matrix data on $K^- p \to \phi \Lambda$ obtained by the Amsterdam-CERN-Nijmegen-Oxford collaboration at 4.2 GeV/c is analysed using a Regge pole model with evasive Regge contributions. The exchanges invoked are the K^*, K^{**}, K,K_A and K_Z. The K^*-K^{**} exchanges are taken to be non-degenerate and a simplifying assumption on their couplings in $0+{}^1/_2 \to O+{}^1/_2$ reactions, advocated recently by Saleem and collaborators (1980, 1981), is generalised to the present case. The author did not find any need for the K_B in fitting data. (14 refs.)

117491 A phenomenological investigation of Kp elastic scattering at high energies and small momentum transfers. M.Kamran (Dept. of Phys., Punjab Univ., Lahore, Pakistan).
Hadronic J. (USA), vol.6, no.4, p.1011-28 (July 1983).
A phenomenological study of Kp elastic $d\sigma/dt$ and polarisation data for $p_{lab} \geq 10$ GeV/c and $|t| \leq 1$ $(GeV/c)^2$ is carried out using the most recent determinations of the relevant Regge trajectory intercepts and forward residues. The radii of interaction of the ρ- and ω-nonflip and ρ-flip contributions, treated as free parameters, are found to have values of 4.5, 5.1 and 4.5 $(GeV/c)^{-1}$ respectively. Particular attention is paid to the anomalous energy dependence of $K^- p$ polarisation and the lowlying σ-trajectory of Dash and Navelet is invoked to explain it. The author does not find any need for a pomeron-flip contribution in contrast to πN and NN scattering. Comparison of the authors results with some other works is made. (26 refs.)

13.75L Meson-meson interactions (energy ≤ 10 GeV)

Evolution condition for electroweak interactions in composite models ....See Entry 117409

13.85 HADRON-INDUCED HIGH- AND SUPER-HIGH-ENERGY INTERACTIONS, ENERGY > 10 GEV

(for low energies, see 13.75)

117492 Study of the reaction $\pi^- p \to K^*(890)\Lambda/\Sigma^0$. M.Saleem (Univ. of the Punjab, Lahore, Pakistan), M.Rafique.
Hadronic J. (USA), vol.6, no.4, p.1048-57 (July 1983).
It is shown that recent measurements of the data for differential and integrated cross sections as well as density matrix elements for $\pi^- p \to K^*(890)\Lambda/\Sigma^0$ at 10 GeV/c can be fitted by using simple Regge pole model with phenomenological residue functions. (7 refs.)

117493 Study of the reaction $\pi^- p \to K^0 \Lambda^0$. M.Saleem, M.Ali (High Energy Phys. Group, Univ. of the Punjab, Lahore, Pakistan).
Hadronic J. (USA), vol.6, no.4, p.1058-71 (July 1983).
The differential and integrated cross section data for the reaction $\pi^- p \to K^0 \Lambda^0$ from 3 to 15.7 GeV/c and the polarization data at 3 and 5 GeV/c are fitted by using simple Regge pole model with phenomenological residues. It is assumed that each of the two non-degenerate K^* and K^{**} trajectories, exchanged in this reaction, is coupled only to one of the two independent helicity amplitudes. (19 refs.)

117494 KNO distributions using the generalization of Novero-Predazzi's ansatz with three constraints. S.Krasznovszky, I.Wagner (Central Res. Inst. for Phys., Budapest, Hungary).
Nuovo Cimento A (Italy), vol.76A, ser.2, no.3, p.539-55 (1 Aug. 1983).
The method of Novero-Predazzi is applied to a set of ansatze ($m = 1,2,3,\ldots$) with three constraints. Hadronic-production cross-sections $\sigma_n(s)$ satisfying KNO-like constraints are determined. $\sigma_n(s)$ and $\langle n \rangle P_n$ automatically have the KNO scaling property. The generalization of the method is investigated for more than three constraints. Comparing the authors' results with the published data for $m = 1,2,\ldots,9$, they find that all calculated higher moments c_k of the KNO distribution for $m = 2$ are in excellent agreement with the observed values of c_ks for pp interactions at Serpukhov, FNAL and ISR energies. (15 refs.)

117495 Multiparticle production in 24, 50 and 400 GeV/c particle-nucleus interactions. A.Shakeel, H.Khushnood, M.Irfan, M.Zafar, A.Ahmad, M.Shafi (Dept. of Phys., Aligarh Muslim Univ., Aligarh, India).
Nuovo Cimento A (Italy), vol.76A, ser.2, no.4, p.699-714 (21 Aug. 1983).
Some interesting aspects of multiparticle production in 24 and 400 GeV/c p-nucleus and 50 GeV/c π^--nucleus collisions have been studied. The correlations of fast target protons with evaporated and shower particles produced in these interactions have been thoroughly investigated. The results reveal that the average number of shower particles produced in these interactions is in marked disagreement with the values predicted by the simple independent-particle and hydrodynamical models. Finally, on invoking the additive quark model, the mean normalized multiplicities R_4 and R_5 are observed to be independent of the nature of the projectile indicating a new kind of scaling in hadron-nucleus interactions. (20 refs.)

117496 Slopes, coherence and compositeness in high-energy collisions with nuclei. A.W.Hendry, D.B.Lichtenberg (Phys. Dept., Indiana Univ., Bloomington, IN, USA), E.Predazzi.
Nuovo Cimento A (Italy), vol.77A, ser.2, no.2, p.147-64 (21 Sept. 1983).
The authors examine some recent data on high-energy collisions involving nuclei. All the main features can be readily understood in terms of various degrees of coherence among the constituents. (17 refs.)

117497 Quantum chromodynamics and the rise of hadronic total cross sections. G.Cohen-Tannoudji, H.Navelet, R.Peschanski (CENS, Gif-sur-Yvette, France), A.Mantrach.
Phys. Rev. D (USA), vol.28, no.7, p.1628-35 (1 Oct. 1983).
The authors have computed the sum of all multiparton-production cross sections induced by one-hard-gluon exchange in the leading-logarithm approximation of QCD for high-energy hadronic collisions. The rise of hadronic total cross sections is explained by the excess of the rise of parton multiplicities with respect to the decrease of each individual cross section. They have shown that this rise is very sensitive to only one free parameter, namely the mass of the constituent quark, but not to other nonperturbative effects. With a reasonable value of 350 MeV, they have obtained a rise of 15 mb between CERN ISR and collider energies. (15 refs.)

13.85D Elastic scattering (energy > 10 GeV)

117498 pp elastic polarisation at 200 GeV/c and pomeron-flip. M.Kamran (Dept. of Phys., Punjab Univ., Lahore, Pakistan).
Hadronic J. (USA), vol.6, no.4, p.1029-33 (July 1983).
It is shown that a parameterisation based on a pomeron-flip contribution with $\alpha_p(t) \simeq 1.07 + 0.1$ t agrees with the recent 200 GeV/c pp elastic polarisation data in the $|t| \leq 1$ $(GeV/c)^2$ region. (3 refs.)

13.85H Inelastic scattering, many-particle final states (energy>10GeV)

117499 Strange-quark suppression in 225-GeV/*c* π^-Be interactions. P.Schoessow, G.O.Alverson, H.S.Budd, T.L.Graff, S.R.Hahn, L.E.Holloway, L.J.Koester, U.E.Kruse, W.-G.Li, P.T.Lukens, R.D.Sard (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA), D.A.Bauer, D.J.Judd, T.B.W.Kirk, T.Lagerlund, S.H.Pordes, R.Raja, L.D.Spires, A.A.Wehmann, J.W.Cooper, V.E.Barnes, C.Davis, A.F.Garfinkel, A.T.Laasanen, S.Hossain, R.H.Milburn, W.P.Oliver, R.K.Thornton.
Phys. Rev. D (USA), vol.28, no.7, p.1773-4 (1 Oct. 1983).
The authors report here on a new measurement of the strange-quark suppression factors λ, using data on $\omega(783)$ and $\phi(1020)$ mesons observed via the decay to $\mu^+\mu^-$. They find $\lambda = 0.31 \pm -0.05$, compared to a world average of about 0.29. (7 refs.)

Charge distribution in a two-chain dual model ....See Entry 117445

13.85K Inclusive reactions, including total cross sections, (energy > 10 GeV)

117500 Diffractive dissociation and the pp multiplicity distribution. K.Fialkowski (Werner Heisenberg Inst. fur Phys., Munich, Germany).
Acta Phys. Pol. B (Poland), vol.B14, no.9, p.679-88 (Sept. 1983).
Multiplicity distributions from proton-proton interactions are analysed in the framework of a two-component model. The asymptotic relations between the dispersion and average multiplicity are discussed using the new data on single proton diffraction at ISR energies. An incompatibility is indicated between the asymptotic stability of relevant phenomenological parameters and the universality of jet parameters for hadron- and lepton-induced processes. (22 refs.)

117501 Secondaries in p$\bar{\text{p}}$ colliders at SPS energies and a multiple production model. S.Bhattacharyya (Phys. & Earth Sci. Div., Indian Statistical Inst., Calcutta, India).
Fizika (Yugoslavia), vol.15, no.3, p.299-309 (July-Sept. 1983).
The recent experimental results obtained from the CERN PP colliders at *SPS* ($\sqrt{S}=540$ GeV) energies have been analysed on the basis of a new multiple production model proposed by Bandyopadhyay and Bhattacharyya. It is shown that the model can describe the data fairly well and passes some crucial tests even at such high energy. (22 refs.)

117502 Soft-gluon corrections to the Drell-Yan process. M.Friedman (Phys. Dept., Northeastern Univ., Boston, MA, USA), G.Pancheri, Y.N.Srivastava.
Nuovo Cimento A (Italy), vol.77A, ser.2, no.2, p.165-83 (21 Sept. 1983).
The 4-momentum distribution of multiple soft-gluon emission is studied using a Block-Nordsieck approach. An asymptotic separability is found. The effect in μ pair production is investigated and explicit expressions for the double differential cross-section are obtained. The slope of the mean transverse momentum with total energy is calculated and compared with data. The mean scaling curves are also in good agreement with experiment. Further tests are suggested. (24 refs.)

117503 Old quark backgrounds in new quark searches. F.Halzen (Res. Inst. for Theoretical Phys., Univ. of Helsinki, Helsinki, Finland), D.M.Scott.
Phys. Lett. B (Netherlands), vol.129B, no.5, p.341-5 (29 Sept. 1983).
Shows that in $\bar{\text{p}}$p events with a high p_T lepton, measurement errors in missing transverse energy allow b, c semileptonic decays to fake t's. The authors further discuss the event structure. (11 refs.)

117504 Production of vector-meson pairs in hadronic collisions. Bing-An Li, Keh-Fei Liu (Dept. of Phys. & Astron., Univ. of Kentucky, Lexington, KY, USA).
Phys. Rev. D (USA), vol.28, no.7, p.1636-43 (1 Oct. 1983).
Production in hadronic collisions of 2^{++} $Q^2\bar{Q}^2$ states which decay predominantly to vector-meson pairs are discussed based on a Drell-Yan-type mechanism with gluon fusion via the color vector-dominance model. The 2^{++} $\phi\phi$ resonance at 2.16 GeV produced in pp and πp collisions is interpreted as a 2^{++} $ss\bar{s}\bar{s}$ four-quark state. The calculated mass and width of this four-quark state, its characteristic S-wave decay, and the theoretical production cross sections in pp reaction at $p_L=400$ GeV/c and πp reaction at $p_L=100$ GeV/c are consistent with experimental data. Estimates of the hadronic production cross sections and their longitudinal- and transverse-momentum distributions for various channels of vector-meson pairs are also presented. (20 refs.)

117505 Proton fragmentation in deep inelastic scattering: a treatment in the valon-recombination model. R.C.Hwa (Dept. of Phys., Univ. of Oregon, Eugene, OR, USA), M.S.Zahir.
Z. Phys. C (Germany), vol.20, no.1, p.27-42 (1983).
A detailed analysis is presented for the fragmentation of a proton in deep inelastic scattering. The valon-recombination model is used as a framework for the description of proton structure on the one hand and of the hadronization of quarks on the other. No arbitrary parameters are involved in the treatment. Perturbative QCD is used to calculate the effects of scaling violation. Predictions are made for the pion inclusive distributions in the proton fragmentation region for semi-inclusive reactions induced by muon, neutrino and antineutrino. The results are determined for both π^+ and π^- at various Feynman x for different values of Bjorken x and Q^2. Resonance contribution in the final state has also been taken into account. (20 refs.)

13.90 OTHER TOPICS IN SPECIFIC REACTIONS AND PHENOMENOLOGY OF ELEMENTARY PARTICLES

117506 The quark mass effect of the distribution amplitudes in $\gamma\gamma$-exclusive processes. Tao Huang (Inst. of High Energy Phys., Acad. Sinica, Peking, China), Zhui-jian Shi.
Commun. Theor. Phys. (China), vol.2, no.3, p.1107-13 (1983).
The authors have analyzed the $\gamma^*\pi^\circ\rightarrow\gamma$, $\gamma\gamma\rightarrow\pi\pi$ and $\pi\pi\rightarrow\rho_\perp\rho_\perp$ processes by using the sum rules of the distribution amplitude $\phi_M(x_i,Q^2)$, which are obtained from the $\pi^\circ\rightarrow\gamma\gamma$ and the $\pi\rightarrow\mu\nu$ decay processes. Since the angular distributions of the $\gamma\gamma\rightarrow\pi^\circ\pi^\circ$ and $\gamma\gamma\rightarrow\rho_\perp\rho_\perp$ amplitudes are sensitive to the shape of the distribution amplitude $\phi_M(x_i,Q^2)$, there is a possibility to investigate the effect of the quark mass from the angular distributions of $\gamma\gamma\rightarrow MM$ exclusive processes. (7 refs.)

117507 Exclusive production of heavy mesons in photon-photon collisions: the double scattering mechanism. S.L.Grayson, R.R.Horgan, P.V.Landshoff (Dept. of Appl. Math. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).
Z. Phys. C (Germany), vol.20, no.1, p.43-52 (1983).
The authors present two mechanisms which can complete with constituent interchange in the exclusive production at wide angle of heavy mesons in photon-photon collisions. They show that they have the same energy behavior as constituent interchange, and that their amplitudes are free from large logarithms. They exploit this to calculate the double-scattering diagrams numerically. They find that while constituent interchange dominates at 90°, double scattering becomes dominant for angles less than about 45°. (15 refs.)

20.00 NUCLEAR PHYSICS

21.00 NUCLEAR STRUCTURE

21.10 GENERAL AND AVERAGE PROPERTIES OF NUCLEI; PROPERTIES OF NUCLEAR ENERGY LEVELS

(for properties of specific nuclei listed by mass ranges, see 27.)

117508 In-beam gamma spectroscopic investigation of ^{73}Se. Li Guang-sheng (Inst. of Atomic Energy, Acad. Sinica, Beijing, China), L.Cleemann, J.Eberth, T.Heck, W.Neumann, M.Nolte, J.Roth.
Chin. J. Nucl. Phys. (USA), vol.5, no.3, p.217-24 (Aug. 1983). In Chinese.
High spin states in ^{73}Se are investigated in the reaction ^{58}Ni(^{19}F, 3pnγ)^{73}Se at incident energies between 56 and 68 MeV using in-beam gamma spectroscopy. The γ-excitation functions, γ-single spectra, γ-γ coincidences, γ-angular distributions and lifetimes are measured by the recoil distance method applying neutron multiplicity technique. A decoupling band with positive parity based on the $9/2^+$ ground state is observed. Negative parity states up to $I^\pi=17/2^-$ can be properly described in the framework of the strong coupling rotation model. (19 refs.)

117509 Can a β-vibration band exist in ^{168}Er?. Lu Lin (Phys. Dept., Nat. Central Univ., Chung-Li, Taiwan), S.Y.Lee, S.F.Tsai, H.-T.Chen.
J. Phys. G (GB), vol.9, no.10, p.L223-7 (Oct. 1983).
A microscopic analysis using the projection before variation method is applied to study the $K^\pi=0^+$ two-quasiparticle bands in ^{168}Er and remarkable agreement with experiment is obtained. It is suggested that the $K^\pi=0^+$ excited bands in ^{168}Er are pure two-quasiparticle bands and cannot be identified as collective β-vibration bands. (21 refs.)

117510 Search for two-octupole-phonon states in ^{208}Pb. M.A.J.Mariscotti, D.R.Bes, S.L.Reich, H.M.Sofia (Dept. de Fisica, Comision Nacional de Energia Atomica, Buenos Aires, Argentina), P.Hungerford, S.A.Kerr, S.A.Schreckenbach, D.D.Warner, W.F.Davidson, W.Gelletly.
Nucl. Phys. A (Netherlands), vol.A407, no.1-2, p.98-126 (3-10 Oct. 1983).
A search for two-phonon octupole vibrational states in ^{208}Pb was carried out using the ^{207}Pb(n$_{th}$,γ) reaction at the High Flux Reactor of the Institut Laue-Langevin. The conversion electron spectrum was scanned with the spectrometer BILL with a sensitivity of 20 μb in the 4-6 MeV interval. Coincidence and singles γ-ray measurements were performed at the end of the thermal neutron beam guide H22-F reaching a sensitivity of 80 μb for energies above 0.511 MeV. In addition the singles spectrum was investigated with the pair spectrometer at the tangential beam facility. Levels have been observed at (energies in keV and parenthesis for tentative level identification and spin-parity assignments): 2614.4, 3^-; 3997, (3^-); 4084.7, 2^+; 4253, (2^-, 3^-), 4704, (2^-, 3^-); (4882.0), (0^+); (49049), (0^+); 4935, 2^+; (6343), (2^+) and the 0^-, 1^- capture state at 7367.9 keV. The 4882.0 keV level probably corresponds to the known two-neutron pairing vibration. Possible candidates for two-phonon octupole excitations are the (0^+)(4904.9) and 2^+ 4935 keV states. (39 refs.)

117511 Band-crossing studied by Cooper-pair exchange particles-plus-soft rotor model. A.Ikeda (Dept. of Phys., Tokyo Inst. of Technol., Tokyo, Japan), N.Onishi.
Prog. Theor. Phys. (Japan), vol.70, no.1, p.128-43 (July 1983).
Extensive numerical calculations are performed to reproduce the experimental energy spectra of even Er-isotopes in the framework of particles-plus-soft rotor model. The full $|i_{13/2}{}^n(\nu\alpha)J\rangle$ space is employed in the calculation. A repulsive interaction in the form of **J.R** is introduced. Using the resultant wave functions, various electromagnetic properties are predicted. (13 refs.)

117512 An extension of the rotating shell model and its application to ^{164}Er. Y.R.Shimizu, K.Matsuyanagi (Dept. of Phys., Kyoto Univ., Kyoto, Japan).
Prog. Theor. Phys. (Japan), vol.70, no.1, p.144-62 (July 1983).
The authors develop an RPA approach based on rotating potentials as an extension of the rotating shell model of nuclear high-spin states. The RPA formalism is applied to the positive-parity yrast spectrum of ^{164}Er. Properties at high spin of the pairing potentials and of the γ-vibrational bands are analyzed as functions of the rotational frequency. The result of calculation indicates an onset in the *s*-band of instability toward triaxial deformation. (28 refs.)

117513 Maximally decoupled collective submanifold in a simple solvable model. F.Sakata (Inst. for Nuclear Study, Univ. of Tokyo, Tokyo, Japan), Y.Hashimoto, T.Marumori, T.Une.
Prog. Theor. Phys. (Japan), vol.70, no.1, p.163-75 (July 1983).
The self-consistent collective-coordinate method formulated within the framework of the time-dependent Hartree-Fock theory is illustrated by using a simple solvable model. A concept of 'maximally-decoupled' collective submanifold obtained by this method turns out to be a so-called hypersurface in the 1*p*-1*h* phase space, on which the TDHF trajectory corresponding to the 'classical' large-amplitude collective motion travels. Various roles of dynamical and kinematical anharmonicity effects neglected under the random phase approximation are also clarified. (12 refs.)

117514 Residual interactions between aligned quasiparticles and pairing deformation changes in ^{165,166}Yb and ^{164}Er. Y.R.Shimizu, K.Matsuyanagi (Dept. of Phys., Kyoto Univ., Kyoto, Japan).
Prog. Theor. Phys. (Japan), vol.70, no.1, p.319-21 (July 1983).
The authors explicitly evaluate the residual interactions between aligned quasiparticles that are associated with the decrease of the pairing deformation Δ. The result of analysis supports the suggestion by Roy et al. that the residual interactions arise mainly from the blocking effects. (11 refs.)

117515 g Factors of the s band in ^{164}Er and ^{166}Yb. Y.Nagai, T.Shibata, H.Ohsumi, H.Ejiri (Dept. of Phys., Osaka Univ., Osaka, Japan).
Phys. Rev. Lett. (USA), vol.51, no.14, p.1247-50 (3 Oct. 1983).
The g factors of the s-band 12^+ levels in ^{164}Er and ^{166}Yb were studied by measuring γ-ray angular distributions and internal conversion coefficients with use of a new electron spectrometer for the interband $12_s{}^+ \to 12_g{}^+$ transitions. The g factors were deduced for the first time to be $g=0.07 \pm 0.03$ for ^{164}Er and -0.14 ± 0.04 for ^{166}Yb. These small values indicate clearly the rotation alignment of the $i_{13/2}$ neutrons for the s band. (14 refs.)

117516 g-boson renormalization effects in the interacting boson model for nondegenerate orbits. P.D.Duval (Dept. of Phys., Carnegie-Mellon Univ., Pittsburgh, PA, USA), S.Pittel, B.R.Barrett, C.H.Druce.
Phys. Lett. B (Netherlands), vol.129B, no.5, p.289-93 (29 Sept. 1983).
A nonperturbative model-space truncation procedure is utilized to include the effects of a single g boson on the parameters of the neutron-proton Interacting Boson Model in the realistic case of nondegenerate single-particle orbits. Particular emphasis is given to the single-boson energies ϵd_ρ ($\rho=\nu,\pi$), with numerical results presented for the even isotopes of Hg. Only part of the observed renormalization is obtained. Possible sources of further renormalizations to ϵd_ρ are discussed. Results are also presented for the renormalizations of the boson quadrupole parameters κ and χ_ρ. (16 refs.)

21.10D Binding energy and masses

117517 Effective mass in nuclei. P.E.Hodgson (Nuclear Phys. Lab., Univ. of Oxford, Oxford, England).
Contemp. Phys. (GB), vol.24, no.5, p.491-503 (Sept.-Oct. 1983).
The concept of effective mass may be used to describe the motion of a nucleon in the nuclear field, at both positive and negative energies. The anomaly around the Fermi energy associated with an energy-dependent effective mass is due to increased absorption in that region. The overall energy dependence of the single-particle potential is associated with the momentum dependence of the Hartree-Fock field. The phenomenological determination of the effective mass from analyses of elastic scattering and other data is described. (28 refs.)

117518 Generalized Hugenholtz-Van Hove theorem and a new mass relation for finite nuclei. L.Satpathy (Inst. of Phys., Bhubaneswar, India), R.Nayak.
Phys. Rev. Lett. (USA), vol.51, no.14, p.1243-6 (3 Oct. 1983).
The usual Hugenholtz-Van Hove theorem for a Fermi system is extended to describe asymmetric nuclear matter. It has been further developed to describe finite nuclei. It is shown that this extended relation could be used as a basis for a new mass relation which has both the liquid-drop and single-particle features. Its success in predicting masses of exotic neutron-rich nuclei is demonstrated. (9 refs.)

117519 The triton binding energy and nd-scattering lengths with account of a quark nucleon structure. N.M.Petrov, A.M.Pushkash.
Ukr. Fiz. Zh. (USSR), vol.28, no.9, p.1304-7 (Sept. 1983). In Russian.
A simple model for the nucleon-nucleon interaction is suggested which takes into account the quark nucleon structure. The triton binding energy and the nd-scattering lengths are calculated on the basis of the model. (17 refs.)

117520 Atomic masses of rare earth isotopes ^{145}Pm and ^{151}Gd, derived from decay measurements of ^{145}Sm and ^{151}Gs. E.Voth, W.-D.Schmidt-Ott (II. Phys. Inst., Univ. Gottingen, Gottingen, Germany), H.Behrens.
Z. Phys. A (Germany), vol.313, no.3, p.167-72 (1983).
The comparison of experimental with calculated K-capture probabilities yielded the decay energies of ^{145}Sm and ^{151}Gd, Q_{EC}=622(5) and 463(3) keV, respectively. Earlier discrepancies in the mass adjustment of these isotopes were removed and adjusted masses for ^{145}Sm, ^{145}Pm and ^{151}Gd derived. In the decay of ^{151}Gd five new γ-rays were found and the half-life remeasured to be 129(4)d. (32 refs.)

117521 Structure information n ^{38}K obtained from a microscopic and macroscopic DWBA analysis of the ^{40}Ca(p,^{3}He)^{38}K reaction. J.C.Sens (Centre de Recherches Nucleaires, Univ. Louis Pasteur, Strasbourg, France), R.J.De Meijer.
Nucl. Phys. A (Netherlands), vol.A407, no.1-2, p.45-59 (3-10 Oct. 1983).
The ^{40}Ca(p,^{3}He)^{38}K reaction has been investigated at E_p=35 MeV. Angular distributions for levels in ^{38}K with E_x<5.3 MeV have been analyzed in terms of a single-step zero-range DWBA with macroscopic as well as microscopic form factors. Besides J^π information, this analysis provides two-nucleon spectroscopic factors. Comparison is made with results of a shell-model calculation. Similar information has been obtained for the first two levels of ^{38}Ca by the ^{40}Ca(p,t)^{38}Ca reaction observed simultaneously. (16 refs.)

117522 Monopolar approximation to the P-H spectra of heavy calcium isotopes. A.Dobado, A.Poves (Dept. de Fisica Teorica, Univ. Autonoma de Madrid, Madrid, Spain).
An. Fis. Ser. A (Spain), vol.79, no.2, p.130-5 (May-Aug. 1983). [received: Oct. 1983]
The authors study the P-H spectra of heavy Ca isotopes using the monopolar isoscalar and isovector approximation. Shell model calculations using effective interactions are compared with experimental results. (6 refs.)

117523 Semi-microscopic calculation of trinucleon cluster states in ^{18}F and ^{18}O. A.C.Merchant (SERC, Daresbury Lab., Warrington, England).
J. Phys. G (GB), vol.9, no.10, p.1169-92 (Oct. 1983).
A strikingly successful phenomenological model which treated a number of low-lying negative-parity states in ^{18}F and ^{18}O as having the structure of an ($A=3$) cluster orbiting an ($A=15$) core is considered. An attempt is made to justify the assumptions inherent in this model on more microscopic grounds. To do this, an effective, local cluster-core potential containing central, spin-orbit, spin-spin and tensor-spin components is derived from the shell-model approximation to the ground state of the ($A=15$) core and a nucleon-trinucleon potential. This latter potential would ideally be obtained from a phase-shift analysis of nucleon-trinucleon scattering data but, in the absence of sufficiently detailed experiments to do this, a family of such potentials, whose non-central terms are taken to have Gaussian geometries of various widths and strengths chosen by considering some of the excited states of the $A=4$ nuclei, is derived and used. Many of the phenomenological assumptions are then semi-microscopically vindicated, and quite reasonable quantitative agreement with the free parameters of the phenomenological model and the measured energies of the trinucleon cluster states in ^{18}F and ^{18}O is obtained. (32 refs.)

117524 Low-lying states of the ^{102}Rh nucleus. Z.Dombradi, A.Krasznahorkay, J.Gulyas (Inst. of Nuclear Res., Hungarian Acad. of Sci., Debrecen, Hungary).
Z. Phys. A (Germany), vol.313, no.3, p.207-11 (1983).
The γ-spectra and γ excitation functions of the ^{102}Ru($p,n\gamma$)^{102}Rh reaction were measured with Ge(Li) and hyperpure Ge spectrometers at various bombarding proton energies between 3.20 and 4.05 MeV. The γ-ray energies and intensities as well as the threshold energies were determined, and 43 new γ-rays were assigned to the ^{102}Rh nucleus. $\gamma\gamma$-coincidence measurements were performed too at 4 MeV bombarding proton energy with Ge(Li) spectrometers. The level scheme of ^{102}Rh was deduced up to 580 keV excitation energy and 12 previously unobserved levels were placed in the scheme. (7 refs.)

117525 Excited states in ^{128}Ba. K.Schiffer, A.Dewald, A.Gelberg, R.Reinhardt, K.O.Zell (Inst. fur Kernphys., Univ. zu Koln, Koln, Germany), S.Xiangfu.
Z. Phys. A (Germany), vol.313, no.3, p.245-6 (1983).
Excited states of ^{128}Ba have been investigated via the ^{118}Sn (^{13}C,3n) reaction by means of in-beam gamma spectroscopy. 28 new levels and several spin and parity assignments were established, revealing the existence of two superbands and a tentative new negative parity band. (9 refs.)

21.30 NUCLEAR FORCES

(see also 13.75C Nucleon-nucleon interactions)

117526 Pion condensation and medium polarization effects on the spin-isospin-dependent particle hole interaction. R.Cenni, G.Dillon, P.Saracco (Istituto de Sci. Fisiche, Univ. Genova, Genova, Italy).
Nuovo Cimento A (Italy), vol.77A, ser.2, no.2, p.231-48 (21 Sept. 1983).
In the context of possible precursor phenomena of a phase transition in nuclear matter the authors have considered the effects of the dressing of π and ρ mesons on the relevant particle holes spin-isospin-dependent residual interaction g'. The model takes into account the contributions to g' due to the direct exchange of π and ρ mesons in the presence of short-range correlations. Since the exact self-energies are expressed effectively through g', one is faced with a self-consistent problem which the authors have solved numerically at increasing densities. (16 refs.)

(for hadronic atoms and molecules, see 36.10)

117527 The dependence on spin of *S* wave neutron strength function. Zhao Zhixiang (Inst. of Atomic Energy, Acad. Sinica, Beijing, China).
Chin. J. Nucl. Phys. (USA), vol.5, no.3, p.273-8 (Aug. 1983). In Chinese.
The statistical method is used to examine the dependence of the neutron strength function on the spin so as to avoid the difficulty caused by lack of spin data. Based on the assumption that the level density is proportional to $(2J+1)$, the reduced neutron width for each population obeys Porter-Thomas distribution and $K=\langle g\Gamma_n^{\,0}(J_1)\rangle/\langle g\Gamma_n^{\,0}(J_2)\rangle$, the superposed distribution with parameter K and random variable $t=g\Gamma_n^{\,0}/\langle g\Gamma_n^{\,0}\rangle$ for two populations are derived. 2595 data are analysed by using the maximum likelihood function and moments method. The result indicates that the neutron strength function for S wave is independent of spin. (7 refs.)

117528 Electromagnetic transitions and radiative capture in the generator-coordinate method. D.Baye, P.Descouvemont (Phys. Theorique et Math., Univ. Libre de Bruxelles, Brussels, Belgium).
Nucl. Phys. A (Netherlands), vol.A407, no.1-2, p.77-97 (3-10 Oct. 1983).
A microscopic study of the electromagnetic properties of nuclei and or radiative capture reactions is presented in the framework of the generator-coordinate method. Fully antisymmetrized wave functions, with a correct asymptotic behaviour, are used to calculate matrix elements of the multipole operators in the long-wavelength approximation. Centre-of-mass corrections are shown to vanish exactly in this approximation. Approximate forms are derived when antisymmetrization is negligible. The E2, E3 and M2 transitions in ^{20}Ne and the ^{16}O(α,γ)^{20}Ne radiative capture reaction are treated as illustrative examples. (27 refs.)

117529 A class of simple Hamiltonians with degenerate ground state. II. A model of nuclear rotation: Spontaneous breakdown of rotation symmetry and Goldstone theorem for finite dimensional system. H.Ui, G.Takeda (Dept. of Phys., Tohoku Univ., Sendai, Japan).
Prog. Theor. Phys. (Japan), vol.70, no.1, p.176-88 (July 1983).
For pt.I see ibid., vol.69, p.1146 (1983). The authors construct a manifestly rotation invariant Hamiltonian describing a system composed of a tensor boson with spin $I=2$—such as, for example, phonon of nuclear quadrupole surface vibration—in which special cubic and quartic self-interactions are taken into account. All the ground state solutions are obtained. It is shown that these solutions can be classified into three classes: The first is the normal vacuum of boson, which is manifestly rotation symmetry. The second class of solutions can be viewed as generated from a single chosen state by rotating it into an arbitrary direction. The third one is Goldstone modes built on this chosen ground state. This chosen state—an exact ground state solution of our rotation invariant Hamiltonian—is not an eigenstate of angular momentum, but contains infinitely many different angular momentum states in it; thus, typifying 'spontaneous breakdown' of 'rotation symmetry'. It is further shown that this state can be naturally identified to an 'intrinsic' deformed state in nuclear collective model of Bohr and Mottelson. The results are examined from the standpoint of Goldstone theorem and detailed discussions are given to explore how Goldstone theorem is modified in our finite dimensional system. (10 refs.)

117530 Numerical test of a modified boson method for multi-phonon states. Single j-shell case. M.Hasegawa, N.Kanesaki (Lab. of Phys., Fukuoka Dental Coll., Fukuoka, Japan).
Prog. Theor. Phys. (Japan), vol.70, no.1, p.315-18 (July 1983).
A modified boson method including the SU(6) model and the interacting boson model is numerically tested. Calculations show that the model well reproduces the energies and the B(E2) values obtained in the phonon-truncated shell model. (7 refs.)

117531 Pairing effects at finite temperature and finite rotational frequencies: an exactly soluble model. O.Civitarese, A.Plastino, A.Faessler (Inst. fur Theoretische Phys., Univ. Tubingen, Tubingen, Germany).
Z. Phys. A (Germany), vol.313, no.3, p.197-206 (1983).
The competition between thermal excitations and rotational degrees of freedom and their influence on the pairing correlations are studied within the framework of an exactly soluble model. The model is based on an $SU(2)\times SU(2)$ representation and it proved to be able to reproduce the collapse of the pairing correlations as a result of both the rotational alignment and the thermal blocking. The validity of the BCS approximation as a function of the temperature and the rotational frequency is discussed. (22 refs.)

117532 Correlated-pair structure in nuclei and possible relation to IBM-2. J.N.L.Akkermans, E.Loriaux, K.Allaart, G.Bonsignori (Natuurkundig Lab., Vrije Univ., Amsterdam, Netherlands).
Z. Phys. A (Germany), vol.313, no.3, p.213-25 (1983).
The broken-pair model is used to study the nature of collective pair structure in even nuclei and a possible connection with the interacting-boson model IBM-2. When microscopically computed quantities are compared with currently used parameters in IBM fits, the authors find not only a considerable renormalization of boson energies, but also of the proton-neutron interaction. One effect responsible for this is Pauli blocking which makes the interaction seniority dependent. The trend of the proton-neutron interaction

parameter κ agrees with single-shell formulas, but for the IBM parameters χ^{ρ} single-shell predictions are of little value. With some rules of thumb for renormalization the calculated parameters come close to those found in empirical fits. (35 refs.)

21.60G Cluster models

117533 The Lipkin pseudospin model in the variational exp*S* formalism. J.Arponen (Res. Inst. for Theoretical Phys., Univ. of Helsinki, Helsinki, Finland), J.Rantakivi.
Nucl. Phys. A (Netherlands), vol.A407, no.1-2, p.141-62 (3-10 Oct. 1983).
The variational extended exp*S* formulation of the coupled-cluster method is numerically studied and applied to the many-particle model of Lipkin, Meshkov and Glick. In contrast to the standard exp*S* scheme the new method is shown to give good results even in the deformed phase without explicit introduction of a new single-particle basis. The ground-state energies are found to satisfy the variational property of being upper limits to the exact energies. Also the excitation energies are in a satisfactory overall agreement with the true ones for arbitrary interaction strengths. Special attention is paid to the phase-transition region of the interaction strength parameter. (16 refs.)

21.65 NUCLEAR MATTER

117534 Thermostatic properties of semi-infinite nuclear matter. II. The asymmetric case. X.Vinas, M.Pi, M.Barranco (Facultad de Fisica, Univ. de Barcelona, Barcelona, Spain).
J. Phys. G (GB), vol.9, no.10, p.1193-8 (Oct. 1983).
For pt.I see Phys. Lett., vol.124B, no.3,4, p.131-4 (1983). Low-temperature (*T*) properties of hot, asymmetric nuclear matter have been studied with the hot, modified Thomas-Fermi (HMTF) method. The evolution with *T* of volume, volume symmetry, surface and surface symmetry energies corresponding to several Skyrme forces is presented. (11 refs.)

117535 Nuclei: a superfluid condensate of α particles? A study within the interacting-boson model. Y.K.Gambhir, P.Ring (Phys.-Dept., Tech. Univ. Munchen, Garching, Germany), P.Schuck.
Phys. Rev. Lett. (USA), vol.51, no.14, p.1235-8 (3 Oct. 1983).
The authors have studied the question of whether pairs of neutrons and pairs of protons of the usual superfluid phases form a bound state to give rise to a superfluid condensate of 'α particles'. They indeed find indications for this to be the case from a BCS-like study for bosons using the proton-neutron interacting-boson model as well as from an even-odd effect in the number of pairs using experimental binding energies. (11 refs.)

21.80 HYPERNUCLEI

117536 Hyperon and hypernuclear physics with intense beams. B.F.Gibson (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
AIP Conf. Proc. (USA), no.102, p.43-53 (1983). (Theoretical Symposium on Intense Medium Energy Sources of Strangeness, Santa Cruz, CA, USA, 18-21 March 1983).
A brief examination of progress in the study of hypernuclear physics and the hyperon-nucleon interaction is presented. The use of Λ-hypernuclei in the study of conventional (nonstrange) nuclei is explored. The status of the hyperon-nucleon force problem is reviewed. Anecdotal results are discussed for baryon numbers 4 and 13. Σ-hypernuclei are discussed. Production of $S=-2$ hypernuclei is mentioned. (7 refs.)

117537 Light *p*-shell Δ-hypernuclei by the microscopic three-cluster model. T.Motoba (Lab. of Phys., Osaka Electro-Communication Univ., Osaka, Japan), H.Bando, K.Ikeda.
Prog. Theor. Phys. (Japan), vol.70, no.1, p.189-221 (July 1983).
A systematic investigation of ${}_{\Lambda}^{6}$He, ${}_{\Lambda}^{6}$Li, ${}_{\Lambda}^{7}$Li, ${}_{\Lambda}^{8}$Li and ${}_{\Lambda}^{9}$Be hypernuclei is carried out within the framework of the microscopic $a+x+\Lambda$ cluster-model dynamics (x+n, p, d, t, or a). The positive and negative parity energy spectra are analysed in detail and are classified into several characteristic 'bands' according to the underlying structures. The E2, E1 and M1 λ-ray transition probabilities and magnetic dipole moments are calculated. The intraband B(E2)s are obtained to be several times enhanced in comparison with the shell-model values. The level widths of the strong peaks observed at lower B_{Λ} are roughly evaluated on the basis of the calculated reduced width amplitudes. The existing data can be well explained by the present model. The cluster-model estimates of the effective neutron number $N_{eff}(\theta=0°)$ for the (K^{-}, π^{-}) reaction are consistent with the experiments. (43 refs.)

23.00 RADIOACTIVITY AND ELECTROMAGNETIC TRANSITIONS

(see also 82.55 Radiochemistry)

23.20 ELECTROMAGNETIC TRANSITIONS

117538 Gamma-ray-spectrometry measurements for actinide decay-scheme studies with particular reference to ^{231}Pa and ^{235}U. M.F.Banham, R.Jones (Chem. Div., AERE, Harwell, England).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1225-31 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
The ^{231}Pa results reported agree well with previously published data over most of the energy range but highlight the difficulty of low-energy measurements. The low-energy gamma rays present problems which need to be solved because of their importance in the construction of the complete decay scheme. The emissions per decay of the γ-rays below 25 keV are low due to high conversion coefficients and their energies are very similar to those of the L-X-rays which dominate this region of the spectrum. The ^{235}U results reported agree very closely with those of Vaninbroukx (1982) and must therefore add weight to the case for a revision of the accepted values first published by Hyde (1964). The value for the 185.7-keV peak is of particular importance in the nuclear industry as it is used in many analytical applications. (13 refs.)

117539 Multiple Coulomb excitation of ^{167}Er. M.Ohshima, E.Minehara, M.Ishii (JAERI, Ibaraki, Japan), T.Inamura, A.Hashizume.
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.2959-62 (Sept. 1983).
The ground-state rotational band in ^{167}Er has been investigated through multiple Coulomb excitation with a 160-MeV ^{35}Cl beam. Excited states up to $25/2^{+}$ were established by measuring γ-γ coincidences and γ-ray angular distributions. Nuclear lifetimes for levels up to spin 23/2 have been determined by analysis of Doppler broadened γ-ray lineshapes. Considerable signature dependence was observed in level energies and M1 transition probabilities.

117540 Proton correlations and the missing M1 strength in ^{48}Ca: a two-state model. W.Knupfer, B.C.Metsch (Inst. fur Theoretische Phys., Univ. Erlangen-Nurnberg, Erlangen, Germany), A.Richter.
Phys. Lett. B (Netherlands), vol.129B, no.6, p.375-8 (6 Oct. 1983).
The recently measured spectroscopic factor for proton pick-up on ^{48}Ca is exploited to estimate the influence of proton correlations on the strength of the magnetic dipole excitation at $E_{X}=10.23$ MeV in ^{48}Ca. A calculation within the framework of a two-state shell-model for both the 0^{+} ground state and the 1^{+} excited state indicates that the presence of proton correlations does not account for the missing M1 strength. (21 refs.)

117541 Decay of ^{109g}Pd to the levels of ^{109}Ag. M.B.Chatterjee, B.B.Baliga (Saha Inst. of Nuclear Phys., Calcutta, India).
Fizika (Yugoslavia), vol.15, no.3, p.273-82 (July-Sept. 1983).
The decay of ^{109g}Pd activity has been studied through high resolution gamma spectroscopy. The half-life of the decay of ^{109g}Pd activity has been measured and found to be 13.85±0.17 hour. On the basis of half-life measurements, gamma-rays have been assigned to ^{109}Ag. A level scheme for ^{109}Ag has been proposed and the assignment of 706.9, 910.7, 912.2 and 1099.1 keV levels have been confirmed. The spin-parities of the levels of ^{109}Ag have been discussed. The properties of the levels have been discussed in the light of the theoretical predictions. (29 refs.)

117542 Half-life measurements at the PTB. K.F.Walz, K.Debertin, H.Schrader (Phys.-Tech. Bundesanstalt, Braunschweig, Germany).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1191-9 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
During the past decade the PTB has measured half lives of more than 35 radionuclides aiming at relative uncertainties of 10^{-4} or less by following the decay of the radioactive substance in a source. The favourite radiation detector was a $4\pi\gamma$ pressurized ionization chamber. The total set of all data measured for a radionuclide was evaluated by a regression analysis. In addition, data sub-groups were evaluated individually in order to discover possible systematic errors and to facilitate the estimation of a realistic uncertainty. (9 refs.)

117543 Half-life measurements of excited levels in the nanosecond and microsecond region. D.Mouchel, H.H.Hansen (Commission of the European Communities, Central Bur. for Nuclear Measurements, Geel, Belgium).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1201-10 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
The application of the delayed-coincidence technique to accurate half-life measurements of excited levels in the nanosecond and microsecond region is described. In order to achieve an overall uncertainty of $\leq 1\%$ on the final values of the half lives a series of precautions depending on the time region have to be taken. In the nanosecond time range the most serious sources of errors are jitter, walk and drift phenomena. To minimize those the time pickoff has to be defined carefully by means of modern fast timing detectors and electronics. In the microsecond time range the ratio of true delayed coincidence to chance coincidences influences considerably the final accuracy of the half-life measurements. It must be the aim to reduce the chance-coincidence rate as much as possible. The successful application of the experimental procedures described yielded the following half-life values for the 37.1-keV level in ^{121}Sb (3.46 ± 0.03)ns, the 81-keV level in ^{133}Cs (6.23 ± 0.03)ns, the 482.18-keV level in ^{181}Ta (10.67 ± 0.05)ns, the 23.87-keV level in ^{119}Sn (18.03 ± 0.07)ns, the 6.21-keV level in ^{181}Ta $(6.05\pm0.12)\mu$s and the 615.25-keV level in ^{181}Ta $(17.64\pm0.14)\mu$s. (35 refs.)

117544 Half life and KX-ray-emission probability of ^{93}Nb^{m}. R.Vaninbroukx (Commission of the European Communities, Central Bur. for Nuclear Measurements, Geel, Belgium).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1211-14 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
The half life and KX-ray-emission probability of ^{93}Nb^{m} were measured to be (16.13 ± 0.15) y and 0.115 ± 0.003, respectively. The half-life result is in excellent agreement with a recently published value, but the KX-ray-emission probability value is about 7.5% higher than the only other available experimental result, quoted with an uncertainty of $\pm2.8\%$. (13 refs.)

117545 Lifetimes of excited levels in ^{47}Ca and ^{39}Ca. P.A.Mando, P.Sona, N.Taccetti (Dipartimento di Fisica, Univ. di Firenze, Firenze, Italy), F.Brandolini, C.Rossi Alvarez, M.De Poli.
J. Phys. G (GB), vol.9, no.10, p.1211-16 (Oct. 1983).
The Doppler-shift attenuation method has been used to determine lower limits for the lifetimes of the first, second and third excited states in ^{47}Ca. The limits obtained are 9, 17 and 2 ps, respectively. As a check, the known lifetime of the first excited state in ^{39}Ca has been remeasured ($\tau=230_{-30}^{+40}$ fs). (12 refs.)

117546 Lifetime of the 1.04 MeV 0^{+}, $T=1$ state in ^{18}F. W.N.Catford, E.F.Garman, D.M.Pringle, L.K.Fifield (Nuclear Phys. Lab., Univ. of Oxford, Oxford, England).
Nucl. Phys. A (Netherlands), vol.A407, no.1-2, p.255-68 (3-10 Oct. 1983).
The mean life of the 1.04 MeV O^{+}, $T=1$ state in ^{18}F has been measured as 2.2 ± 0.6 fs using a refinement of the Doppler-shift attenuation method. The reaction ^{3}He(^{16}O,p)^{18}F at a mean beam energy of 26.6 MeV was used to populate the 1.04 MeV level with a recoil velocity $v/c=4.4\%$. The targets were ^{3}He implanted in foils of magnesium, aluminium, tantalum and gold. The result is compared with shell-model calculations, and its relevant to the search for parity non-conservation in the system comprising the 1.04 Mev level and the 1.08 MeV 0^{-}, $T=0$ level in ^{18}F is discussed. (20 refs.)

23.20N Internal conversion and extranuclear effects

117547 K/LM+ internal-conversion ratios for pure E2 transitions in the decays of ^{152}Eu and ^{192}Ir. H.H.Hansen, D.Mouchel (Commission of the European Communities, Central Bur. for Nuclear Measurements, Geel, Belgium).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1233-9 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
Measurements have been made with a magnetic β-ray spectrometer in order to determine the internal-conversion ratio R=K/LM+ for pure E2 transitions of 244.7 and 344.3 keV in the decay of ^{152}Eu and of 205.8 and 316.5 keV in the decay of ^{192}Ir. The results from several experimental runs for each transition are respectively, $R=2.92\pm0.05$, 3.43 ± 0.05, 1.05 ± 0.04 and 1.71 ± 0.05. A comparison has been made with previously published results as well as with theoretical values deduced for pure E2 multipolarity from the most recent tabulations of internal-conversion coefficients. (25 refs.)

23.40 BETA DECAY; ELECTRON AND MUON CAPTURE

117548 Standardization and decay data of ^{169}Yb. E.Funck, U.Schotzig, K.F.Walz (Phys.-Tech. Bundesanstalt, Braunschweig, Germany).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1215-24 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
The gamma- and X-ray-emission probabilities per decay of ^{169}Yb were determined directly from the ratio of the emission rates and the activity. The emission rates were measured with calibrated semiconductor spectrometers and the activity with $4\pi\beta$-γ coincidence counting systems and a $4\pi\gamma$-NaI(Tl) high-efficiency-counting device. Measurements of the half life were carried out with a $4\pi\gamma$ ionisation chamber. (27 refs.)

117549 Measurement of the beta-ray spectra of ^{90}Sr-^{90}Y. H.H.Hansen (Commission of the European Communities, Central Bur. for Nuclear Measurements, Geel, Belgium).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1241-7 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
The β-ray spectra of ^{90}Sr and ^{90}Y have been remeasured with the CBNM magnetic β-ray spectrometer. From the measurements the endpoint energies ($W_0[m_oc^2]$ and E_0[keV]), the spectrum shapes (coefficient, a, of the shape-correction factor, 1+aW), and the ratio of the numbers of β particles emitted in the decays of respectively ^{90}Y and ^{90}Sr, $(I_{\beta1}/I_{\beta2})$, have been determined. The results are for ^{90}Y, β_1 transition: $W_{01}=5.4608\pm0.0058$, $E_{01}=(2279.5\pm2.9)$ keV, $a_1=-(0.0078\pm0.0024)$; ^{90}Sr, β_2 transitions: $W_{02}=2.0685\pm0.0032$, $E_{02}=(546.0\pm1.6)$ keV, $a_2=-(0.032\pm0.007)$. The ratio of the numbers of emitted β particles is $I_{\beta1}/I_{\beta2}=1.00\pm0.01$. Corrections to the measured data and the estimates of uncertainties are discussed. (14 refs.)

117550 Measurements and evaluation of decay data of fission products. N.Coursol, F.Lagoutine, B.Chauvenet (Lab. de Metrologie des Rayonnements Ionisants, CENS, Gif-sur-Yvette, France).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1265-7 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
During the past ten years, the authors' institute has evaluated decay data for more than a hundred radionuclides, including twenty common fission products. The evaluation work in this field is still going on. Knowledge of decay data is of special interest for the calculation of nuclear-reactor decay heat. The recommended decay data for ^{125}Sb are given as an example. (7 refs.)

117551 Limit on Im (C_SC_A*) from a test of T invariance in ^{19}Ne beta decay. M.B.Schneider, F.P.Calaprice, A.L.Hallin, D.W.MacArthur, D.F.Schreiber (Dept. of Phys., Princeton Univ., Princeton, NJ, USA).
Phys. Rev. Lett. (USA), vol.51, no.14, p.1239-42 (3 Oct. 1983).
An investigation of the time-reversal-odd angular correlation $\hat{\sigma}.(\hat{J}\times\vec{p}/E)$ in ^{19}Ne β decay is reported. In this correlation, $\hat{\sigma}$, $\vec{p}$, and E are the β spin, momentum, and energy, respectively, and $\hat{J}$ is the initial ^{19}Ne spin. The sample was polarized by an atomic beam method and the β polarization was measured with four Mott-scattering polarimeters. The magnitude R of the angular correlation is found to be -0.079 ± 0.053, consistent with time-reversal invariance. This result also implies $\mathrm{Im}(C_SC_A^*)=0.19\pm0.13$. (14 refs.)

117552 New isomers and their decay in odd-odd neutron-deficient cesium isotopes. B.Weiss (Lab. de Radiochimie, Univ. de Nice, Nice, France), C.F.Liang, P.Paris, A.Peghaire, A.Gizon.
Z. Phys. A (Germany), vol.313, no.3, p.173-87 (1983).
By a systematic on-line cesium mass separation from $A=122$ to $A=132$ and subsequent gamma and electron decay spectroscopy at very low energy, new isomers have been precisely identified: ^{122m}Cs ($T_{1/2}=0.36\pm0.02$ s), ^{124m}Cs ($T_{1/2}=6.3\pm0.2$ s) and ^{130m}Cs ($T_{1/2}=3.46\pm0.06$ min). Detailed level schemes are given for both ^{124m}Cs and ^{130m}Cs. Comparison of excited levels known in the odd-odd nuclei of the same region shows that more experimental informations are needed to propose a clear and realistic picture of the nuclear states structure. (36 refs.)

117553 The estimation of β-delayed two-neutron emission probability in the $A\geq50$ region. Yu.S.Lyutostansky (Moscow Phys.-Engng. Inst., Moscow, USSR), I.V.Panov.
Z. Phys. A (Germany), vol.313, no.3, p.235-8 (1983).
The probability of recently discovered β-delayed two-neutron emission is calculated using the microscopic model based on the finite Fermi systems theory. For nuclei of ^{50,51,52}K, ^{86}As, ^{92}BR, ^{91}Se, ^{98,99,100}Rb, ^{132}In, ^{136}Sb with measured half-lives predictions are made. The effect of the β-strength function structure on β-delayed two-neutron emission probability in the continuous part of the spectrum is discussed. (11 refs.)

117554 Half-lives of the neutron-rich isotopes ^{100}Sr, ^{100}Y, ^{148}Ba and ^{148}La. J.Munzel (II. Phys. Inst., Univ. Giessen, Giessen, Germany), B.Pfeiffer, H.Wollnik.
Z. Phys. A (Germany), vol.313, no.3, p.247-8 (1983).
Using a high-temperature ion source at the fission product separator OSTIS the authors determined the half-lives of ^{100}Sr (214 ± 8 ms), ^{100}Y (682 ± 18 ms), ^{148}Ba (672 ± 7 ms) and ^{148}La (1.34 ± 0.02 s) by γ-multispectra measurements. (8 refs.)

117555 Beta-decay energy and nuclear mass of ^{100}Nb. U.Keyser, F.Munnich, B.Pahlmann (Inst. fur Metallphys. und Nukleare Festkorperphys., Tech. Univ. Braunschweig, Braunschweig, Germany), B.Pfeiffer, H.Weikard.
Z. Phys. A (Germany), vol.313, no.3, p.251-2 (1983).
The Q_β-value of ^{100}Nb has been measured at the mass separator OSTIS in order to resolve discrepancies between the results of β-decay and reaction studies concerning the mass of this nucleus. From 9 experimental β-endpoint energies, a consistent Q_β-value of 6250 ± 35 keV has been obtained, in agreement with earlier β-spectroscopic studies. This result confirms that the nucleus ^{100}Nb belongs to a transition region between spherical and deformed nuclear shape. (11 refs.)

23.90 OTHER TOPICS IN NUCLEAR DECAY AND RADIOACTIVITY

117558 Experiments for the investigation of ground-state proton radioactivity. S.Hofmann (Gesellschaft fur Schwerionenforschung, Darmstadt, Germany).
Atomkernenerg. Kerntech. (Germany), vol.42, no.3, p.157-64 (1983). In German.
Ground-state proton radioactivity has been observed in experiments at the velocity separator SHIP and at the mass separator online to the UNILAC accelerator. The activities have been observed in the reactions $^{58}Ni+^{96}Ru\rightarrow^{154}Hf^*$ and $^{58}Ni+^{92}Mo\rightarrow^{150}Yb^*$ and could be assigned to ^{151}Lu and ^{147}Tm respectively. The decay properties can be described with a simple transmission model for protons and spectroscopic data from shell model considerations. (40 refs.)

24.00 NUCLEAR REACTIONS AND SCATTERING: GENERAL

24.10 NUCLEAR REACTION AND SCATTERING MODELS AND METHODS

117559 A study of *Q*-value effects on barrier penetration. C.H.Dasso, S.Landowne (Nordita, Copenhagen, Denmark), A.Winther.
Nucl. Phys. A (Netherlands), vol.A407, no.1-2, p.221-32 (3-10 Oct. 1983).
Coupled-channel equations for barrier penetration problems are solved anlytically to show the effects which finite Q-values have on the total transmission function. (8 refs.)

117560 Jacobian free global event analysis. P.Danielewicz, M.Gyulassy (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
Phys. Lett. B (Netherlands), vol.129B, no.5, p.283-8 (29 Sept. 1983).
Conventional global event analysis using the sphericity tensor is shown to be biased against shapes with degenerate radii and vanishing flow angles for multiplicities $M<100$. The jacobian responsible for the bias is computed analytically. The authors construct a jacobian free distribution that eliminates most of the $O(1/\sqrt{M})$ distortions. Finally, an azimuthally corrected sphericity matrix is shown to be useful in searching for collective flow phenomena in nuclear collisions. (11 refs.)

117561 On determination of duration of nuclear reactions with charged particles and γ-rays. V.S.Olkhovskii.
Ukr. Fiz. Zh. (USSR), vol.28, no.9, p.1319-23 (Sept. 1983). In Russian.
Determination of durations of nuclear reactions with charged particles and γ-rays is generalized. It is shown that the scattering duration in the threshold range is a finite and continuous function of the energy if the lifetime finiteness of excited target nucleus states is taken into account. It is established under what condition the scattering durations in the threshold range can grow up to maximum values determined by widths of the target nucleus excited states. (9 refs.)

117562 Friction coefficients for deep inelastic heavy-ion collisions. S.Yamaji (Inst. of Phys. & Chem. Res., Saitama, Japan), A.Iwamoto.
Z. Phys. A (Germany), vol.313, no.3, p.161-6 (1983).
The friction coefficients for deep inelastic collisions are re-evaluated microscopically in the framework of the linear response theory, adopting the cutoff procedure of Jensen et al. (1982) to take account of lifetime of particle-hole excitations. They have the same order of magnitude as the previous ones with a constant time cutoff parameters. (14 refs.)

117563 Resonance parameters of the two low-energy iridium resonances. P.Fischer, U.Harz, H.G.Priesmeyer (Inst. fur Reine und Angewandte Kernphys., Univ. Kiel, Kiel, Germany).
Atomkernenerg. Kerntech. (Germany), vol.42, no.3, p.203 (1983).
Uses U-238 levels for spectrometer calibration, to determine the Ir-191 and Ir-193 resonance energies in relation to this standard. (4 refs.)

117564 Self-consistent calculations of nuclear response for closed-shell nuclei. J.Decharge, L.Sips (Service de Phys. Neutronique et Nucleaire, Centre d'Etudes de Bruyeres-le-Chatel, Montrouge, France).
Nucl. Phys. A (Netherlands), vol.A407, no.1-2, p.1-28 (3-10 Oct. 1983).
A fully self-consistent calculation of nuclear response in the giant resonance region for closed-shell nuclei ^{16}O through ^{208}Pb is presented. The finite-range density-dependent interaction D1 has been utilized. Particular attention has been given to the momentum transfer dependence and thus the electromagnetic transition operator exp $(iq.r)$ has been considered. Corresponding energy-weighted sum rules have been evaluated to ascertain the relevance of the calculated response. The correctness of transition densities for known resonances has made it possible to suggest the existence of several other resonances in the higher frequency region presently accessible experimentally. 25.20 PHOTONUCLEAR REACTIONS AND PHOTON SCATTERING

117565 A sum rule approach to effective charges in electromagnetic knock-out reactions. S.Roffi, C.Giusti, F.D.Pacati (Dipartimento di Fisica Nucleare, Univ. di Pavia, Pavia, Italy), M.Rosa-Clot.
Nuovo Cimento A (Italy), vol.76A, ser.2, no.4, p.685-98 (21 Aug. 1983).
Centre-of-mass motion and exchange effects can be considered in nuclear knock-out by real and/or virtual photons by means of effective charges in order to retain the attractive feature of single-particle transitions. These effective charges are obtained by splitting the energy-weighted sum rule for the charge operator into a proton and a neutron contribution. The q-dependence of such effective charges is investigated for several nuclei. As $q\rightarrow0$ the dipole limit is recovered, while for $q\rightarrow\infty$ one obtains the quasi-free scattering limit. A simple model is used for the exclusive reaction both with real and virtual photons to define the corresponding effective charges which are more sensitive to the details of the reaction kinematics. The ratio e_p^2/e_n^2 is in agreement with the $(\gamma,p)/(\gamma,n)$ data. (22 refs.)

117566 Measurement of the total neutron cross-section of selenium at neutron energies below 2 eV. M.Salama (Nuclear Res. Center, Atomic Energy Establ., Cairo, Egypt).
Atomkernenerg. Kerntech. (Germany), vol.42, no.3, p.187-9 (1983).
Total neutron cross-section of ordinary selenium has been measured at room temperature as a function of neutron energy in the range from 2.2 eV to 5.5 meV. The measurements were performed using the transmission method in connection with a time-of-flight spectrometer installed in front of one of the horizontal channels of the ER-RR-1 reactor. Expression for the dependence of the total neutron cross-section of selenium upon energy was obtained. New values for the coherent scattering amplitude as well as the coherent scattering cross-section of selenium were also determined. Values for the average scattering cross-section and the total incoherent scattering cross-section were also obtained. The values of both potential scattering cross-section and effective potential scattering radius R' were determined for this element from the measured behaviour of the total cross-section, using the single level Breit-Wigner formula. The determined value of R' was found to be in agreement

with that predicted from vibrational-rotational optical model calculations. (18 refs.)

117567 **Quasi-free reaction ^{12}C(p,d^{3}He)^{8}Be.** Liu Xianhui (Inst. of High Energy Phys., Acad. Sinica, Beijing, China), Chen Xuejun.
Chin. J. Nucl. Phys. (USA), vol.5, no.3, p.249-53 (Aug. 1983). In Chinese.
Based on the independent particle model of α-cluster the wave functions of the relative motion between α-cluster and ^{8}Be-cluster in nucleus ^{12}C are reduced, and then the energy sharing spectra of the quasi-free reactions ^{12}C (p,d^{3}He)^{8}Be at the bombarding energy of 100 MeV are calculated by PWIA and DWIA. The results obtained are in good agreement with the experimental data. (11 refs.)

117568 **The determination of forward and backward average projectional recoil ranges in the ^{65}Cu(n,2n)^{64}Cu and ^{27}Al(n,α)^{24}Na reactions induced by D-T neutrons.** Guo Yinghuan, Zhao Zhenlan, Zhang Jinglie, Luo Shihua, Huang Zhongxiang, Yang Ruiying, Jiang Yong, Feng Xizhang (Inst. of High Energy Phys., Acad. Sinica, Beijing, China).
He Huaxue Yu Fangshe Huaxue (China), vol.4, no.4, p.234-7 (Nov. 1982). In Chinese. [received: Sept. 1983]
In this work, the forward and backward average projectional recoil ranges (R) of the residual ^{64}Cu and ^{24}Na with respect to neutron beam direction respectively in the ^{65}Cu(n,2n)^{64}Cu and ^{27}Al(n,α)^{24}Na reactions induced by D-T neutrons were determined by thick-target-thick-catcher method. The results are $R_F=73.8\pm13.1$ μg/cm^2, $R_B=10.0\pm5.1$ μg/cm^2 for ^{64}Cu in Cu-target and $R_F=282.9\pm11.0$ μg/cm^2, $R_B=20.0\pm3.4$ μg/cm^2 for ^{24}Na in Al-target. (13 refs.)

117569 **Investigation of the ^{48}Ti(n,γ)^{49}Ti reaction.** J.F.A.G.Ruyl (FOM-ECN, Netherlands Energy Res. Found., Petten, Netherlands), P.M.Endt.
Nucl. Phys. A (Netherlands), vol.A407, no.1-2, p.60-76 (3-10 Oct. 1983).
The energy E_γ and the intensity I_γ of 97 γ-rays produced by capture of thermal neutrons in ^{48}Ti have been measured. Of the total observed strength 99.6% has been placed in the decay scheme which consists of 78 transitions between 28 levels. The Q-value of 8142.41(3) keV is in agreement with previous data. From a measurement of the γ-ray circular polarization resulting from the capture of polarized neutrons, combined with previous (d,p) work, the spins of 5 levels could be determined, and those of 13 other levels could be confirmed. The primary strength to 2p states agrees with a sum rule estimate. The nature of the capture process was determined as valence capture. The total cross-section estimate agrees with experiment. The total number of $J^\pi=(^1/_2\text{-}^5/_2{}^-)$ levels below $E_x=3.8$ MeV and the resonance level density are explained satisfactorily by the Fermi gas model. (25 refs.)

117570 **A study of ^{206}Pb by inelastic scattering of 35 MeV protons.** J.E.Finck (Dept. of Phys., Northern Michigan Univ., Marquette, MI, USA), G.M.Crawley, J.A.Nolen,Jr., R.T.Kouzes.
Nucl. Phys. A (Netherlands), vol.A407, no.1-2, p.163-92 (3-10 Oct. 1983).
Using high-resolution techniques the inelastic scattering of 35 MeV protons by ^{206}Pb was measured. Approximately 180 levels with excitation energies up to 6.8 MeV were identified and angular distributions of most of these states were measured. The L-transfers and deformation parameters were determined by comparison of the measured angular distributions to collective-model calculations. Microscopic calculations of natural-parity states are presented and allow a test of RPA and TDA wave functions. Unnatural-parity states were also studied microscopically and permit an examination of the central and noncentral forces in the effective interaction. (29 refs.)

117571 **Inclusive (p,p′) reactions at medium energies.** Y.Tzeng, T.Tamura (Dept. of Phys., Univ. of Texas, Austin, TX, USA).
Phys. Lett. B (Netherlands), vol.129B, no.6, p.379-83 (6 Oct. 1983).
By extending the formalism of Krimm et al. (1981) so that spin-dependent amplitudes can be used in the multiple-scattering treatment of the A(p,p′)X reactions, ^{12}C(p,p) dat at $E_p=800$ MeV were analyzed. Reasonably good fits to data were obtained for both cross sections and analyzing powers. (6 refs.)

117572 **Isotopic effects in the (n,p) reaction cross section on he;avy targets and the statistical preequilibrium model.** R.Caplar, L.Udovicic, E.Holub, D.Pocanic, N.Cindro (Rudjer Boskovic Inst., Zagreb, Yugoslavia).
Z. Phys. A (Germany), vol.313, no.3, p.227-34 (1983).
The systematic decrease in (n,p) cross sections with increasing neutron number for isotopes in reactions induced by 14 MeV neutrons on heavy targets is explained in terms of the preequilibrium model. The relevant physical quantities responsible for this behaviour are proton and neutron separation energies, similarly to (n,p) reactions on lighter nuclei, in which proton emission is governed by the compound-nucelus model. The principal transition rate λ_+ in the preequilibrium exciton-model calculations should be kept constant (for a given number of excitons and constant energy) in order to obtain a good description of data. The calculations are compared with experimental (n,p) cross sections for series of Te, Xe, W and Os isotopes. (25 refs.)

117573 **Curium-248 neutron data evaluation.** M.Caner, S.Yiftah.
Report IA-1383, Israel Atomic Energy Comm., Tel Aviv (Feb. 1983), iii+35 pp.
An evaluation of ^{248}Cm neutron data was performed. All significant cross sections in the neutron energy range 10^{-3} to 15×10^{6} eV were considered. The experimental data were complemented by spherical optical model and statistical theory calculations. The evaluated data were compared with those in the ENDF/B-V file. (32 refs.)

25.50 ^{2}H- AND ^{3}H-INDUCED REACTIONS AND SCATTERING

117574 **Soft repulsive core effects in the d+d scattering and reaction.** Zhao Xuan, Zeng Fanan (Inst. of Nuclear Res., Acad. Sinica, Shanghai, China).
Chin. J. Nucl. Phys. (USA), vol.5, no.3, p.239-48 (Aug. 1983). In Chinese.
By using the one-channel RGM in which a central nucleon-nucleon potential containing a soft repulsive core (SRC) is adopted, the authors have calculated the d+d scattering phase shifts, differential scattering cross sections and total reaction cross sections at a series of energies below 20 MeV with and without imaginary potential. The agreement between the theoretical and experimental results is good. The main conclusions are as follows: (a) the phase shifts calculated with SRC are lower than that calculated without repulsive core (RC); (b) the SRC makes the total reaction cross sections decrease distinctly and makes the differential scattering cross sections at the forward and backward angle increase distinctly, but it does not have large influence upon the differential cross sections at other angles; (c) the SRC has some marked effects on the d+d scattering phase shifts, differential cross sections and total reaction cross sections. (13 refs.)

117575 **On the determination of the deuteron quadrupole moment by elastic scattering of polarised deuterons.** J.E.Kammeraad, L.D.Knutson (Dept. of Phys., Univ. of Wisconsin, Madison, WI, USA).
J. Phys. G (GB), vol.9, no.10, p.L217-22 (Oct. 1983).
It is shown that the deuteron quadrupole moment can be determined from measurements of the tensor analysing power T_{20} for sub-Coulomb deuteron elastic scattering. A first result, $Q=0.282\pm0.019$ fm^2, is obtained from measurements of T_{20} for ^{208}Pb(d,d) at a deuteron energy of 4 MeV. (14 refs.)

117576 **Investigation of the ^{1}H(d,pp)n reaction in collinear geometry at 12.8, 14.2 and 15.6 MeV.** D.L.Chuprunov, M.S.Golovkov, S.N.Kondratyev, T.N.Mikhaleva, A.M.Popova, V.V.Zatekin (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR).
J. Phys. G (GB), vol.9, no.10, p.1199-210 (Oct. 1983).
Differential cross sections have been measured for the ^{1}H(d,pp)n reaction in collinear and non-collinear geometry at incident deuteron energies of 15.6, 14.2 and 12.8 MeV. The results are compared with an exact three-body calculation by using two-particle charge-dependent interactions for the S wave. The calculations fit the experimental data. (13 refs.)

117577 **Kinematically complete measurement of cross sections and vector and tensor analyzing powers of ^{4}He($\vec{d}$,pα)n at $E_{\vec{d}}=10$ MeV.** M.Bruno, F.Cannata, M.D'Agostino (Istituto di Fisica, Univ. di Bologna, Bologna, Italy), B.Jenny, W.Gruebler, V.Konig, P.A.Schmelzbach, P.Doleschall.
Nucl. Phys. A (Netherlands), vol.A407, no.1-2, p.29-44 (3-10 Oct. 1983).
Differential cross sections and vector and tensor analyzing powers have been measured in the breakup reaction ^{4}He($\vec{d}$,pα)n at $E_{\vec{d}}=10$ MeV, for $\theta_\alpha=46°$, $\theta_p=46°$ in a kinematically complete coincidence experiment. The kinematics allow for np final-state interaction (FSI) (E_{np}=O). A comparison with theoretical predictions based on Faddeev equations is presented. Phenomenologically it appears that there are larege interference effects between the different FSI and the importance of Coulomb interaction emerges clearly. (29 refs.)

25.60 ^{3}HE- AND ^{4}HE-INDUCED REACTIONS AND SCATTERING

117578 **The even-odd effect of the pre-equilibrium emission in ^{59}Co, ^{60}Ni, ^{63}Cu, ^{64}Zn (α,p) reactions.** Lu Xiuqin, Cheng Yehao, Yang Zhuqing, Zhao Kui, Zhu Guanghua, Jiang Chenglie (Inst. of Atomic Energy, Acad. Sinica, Beijing, China).
Chin. J. Nucl. Phys. (USA), vol.5, no.3, p.193-202 (Aug. 1983). In Chinese.
The energy spectra of protons emitted in the ^{63}Cu (α,p), ^{64}Zn (α,p), ^{60}Ni (α,p) reactions are measured at $E_\alpha=18$ MeV. It is found that the fractions of pre-equilibrium emission in odd-A target cases are larger than in even-even target cases. The experimental results are analyzed using exciton model. The even-odd effect about the pre-equilibrium emission in ^{59}Co, ^{60}Ni, ^{63}Cu, ^{64}Zn (α,p) reactions is discussed in detail. The fraction of the pre-equilibrium emission depends strongly on the related binding energies and pairing energies, and these energies depend systematically on the nucleus. The even-odd effect in the (α,n) reactions and other related problems are also discussed. (14 refs.)

117579 **Band structure in ^{81}Sr.** S.E.Arnell, C.Ekstrom (Dept. of Phys., Chalmers Univ. of Technol., Gothenburg, Sweden), L.P.Ekstrom, A.Nilsson, I.Ragnarsson, P.J.Smith, E.Wallander.
J. Phys. G (GB), vol.9, no.10, p.1217-35 (Oct. 1983).
The reactions ^{78}Kr(α,n) and ^{80}Kr(α,3n) were used to populate excited states in ^{81}Sr. The de-excitation of these states was studied by in-beam γ-ray spectroscopy. A number of new high-spin states forming band structures have been observed. Lifetime measurements have also been performed. Theoretical calculations using a particle-rotor approach based on the Nilsson model have been made. The different bands are generally well reproduced. (35 refs.)

117580 **Low-lying levels in ^{125}Xe and ^{127}Xe.** A.D.Irving, P.D.Forsyth, I.Hall, D.G.E.Martin (Oliver Lodge Lab., Univ. of Liverpool, Liverpool, England).
J. Phys. G (GB), vol.9, no.10, p.1245-69 (Oct. 1983).
The nuclei ^{125}Xe and ^{127}Xe have been studied by the ^{122}Te(α,n)^{125}Xe, ^{124}Te(α,n)^{127}Xe, ^{125}Te(α,2n)^{127}Xe and ^{123}Sb(^{7}Li,3n)^{127}Xe reactions. In-beam γ-ray spectroscopy measurements largely confirm the level schemes and band structures proposed earlier for these nuclei. The results are compared with recent theoretical calculations and appear to be in good overall agreement with those based on the interacting boson-fermion model, though the electromagnetic decay properties suggest that refinements in the calculations are required. (33 refs.)

117581 **In-beam investigation of high-spin states in actinides with (α,xn) compound reactions.** K.Hardt, P.Schuler, C.Gunther, J.Recht, K.P.Blume (Inst. fur Strahlen- und Kernphys., Univ. Bonn, Bonn, Germany).
Nucl. Phys. A (Netherlands), vol.A407, no.1-2, p.127-40 (3-10 Oct. 1983).
The ground-state rotational bands in ^{230,232}U and ^{236,238,240}Pu were investigated in (α,xn) reactions. Conversion electrons mere measured with an iron-free orange spectrometer in order to suppress the background from fission. Levels up to $I^\pi\approx16^+$ were identified in e$^-\gamma$ coincidence measurements. The systematics of the ground-state rotational bands in the even actinides is discussed. (24 refs.)

Electromagnetic transitions and radiative capture in the generator-coordinate method ....See Entry 117528

25.70 HEAVY ION INDUCED REACTIONS AND SCATTERING

117582 **A study of the (^{6}Li,^{7}Be) reaction in the mass-90 region at 60 MeV.** R.Wadsworth, M.D.Cohler, M.J.Smithson, D.L.Watson (Postgraduate School of Phys., Univ. of Bradford, Bradford, England), F.Jundt, L.Kraus, I.Linck, J.C.Sens.
J. Phys. G (GB), vol.9, no.10, p.1237-44 (Oct. 1983).
Angular distributions have been measured for the reactions ^{90}Zr(^{6}Li,^{7}Be$_{GS}$)^{89}Y, ^{90}Zr(^{6}Li,^{7}Be$_{0.43}$)^{89}Y, ^{89}Y(^{6}Li,^{7}Be$_{GS}$)^{88}Sr and ^{89}Y(^{6}Li,^{7}Be$_{0.43}$)^{88}Sr at an incident beam energy of 60 MeV in the angular range 6°-45° (lab). Exact finite-range distorted-wave Born approximation calculations have been performed and were found to be moderately successful in

reproducing the shape of the experimental angular distribution. The optical-model parameters used in the calculations were obtained from a global set of parameters which was capable of reproducing the ^{6}Li and ^{7}Li elastic scattering data taken at 60 MeV. In the analysis of the reaction data the $^7Be_{GS}$ was assumed to be a mixed state of $1p_{3/2}$ and $1p_{1/2}$ configurations, whilst the $^7Be_{0.43}$ state was assumed to be due to a pure $1p_{3/2}$ configuration, in agreement with shell-model calculations and previous experimental results. Spectroscopic factors were deduced from a comparison of the theoretical and experimental cross sections. The results obtained were found to be in good agreement with those deduced from light-ion reactions. (13 refs.)

117583 Elastic fusion and total reaction cross-sections for the $^{12}C+^{32}S$ system at $E(^{32}S)=160$ MeV. R.Giordano, F.Porto, S.Sambataro, A.Scalia (Istituto Dipartimentale di Fisica, Univ. Catania, Catania, Italy).
Nuovo Cimento A (Italy), vol.77A, ser.2, no.2, p.135-46 (21 Sept. 1983).
Elastic scattering, evaporation residues and total reaction cross sections have been measured for the system $^{12}C+^{32}S$ and $E(^{32}S)=160$ MeV. The total reaction cross-section has been also extracted by means of the modified SOD method. The experimental results have been interpreted in the light of a simple model underlying the method. (11 refs.)

117584 Spin-orbit potentials for elastic scattering of polarized ^{6}Li ions from ^{12}C and ^{58}Ni. K.Rusek, Z.Moroz (Inst. of Nuclear Res., Warsaw, Poland), R.Caplar, P.Egelhof, K.-H.Mobius, E.Steffens, I.Koenig, A.Weller, D.Fick.
Nucl. Phys. A (Netherlands), vol.A407, no.1-2, p.208-20 (3-10 Oct. 1983).
Angular distributions of the differential cross section σ/σ_R, of the vector analyzing power iT_{11} and of the 2nd rank tensor analyzing power $^TT_{20}$ have been measured for elastic scattering of ^{6}Li from ^{12}C and ^{58}Ni at 19.2 and 20.0 MeV, respectively. The vector and tensor polarization data can be well described using in addition to the complex central potential a real spin-orbit potential. Best-fit potentials are compared with those from folding models. In addition, vector analyzing power data were measured for ^{6}Li-^{122}C elastic scattering at 9.0 MeV bombarding energy. They are compared to predictions derived from an analysis of previously measured tensor analyzing powers of the same system at the same energy. (22 refs.)

117585 Linear momentum transfer investigated in the $^{20}Ne+^{197}Au$ and ^{209}Bi systems at 30 MeV/u. G.La Rana, G.Nebbia, E.Tomasi, C.Ngo, X.S.Chen, S.Leray, P.Lhenoret, R.Lucas, C.Mazur, M.Ribrag (CENS, Gif-sur-Yvette, France), C.Cerruti, S.Chiodelli, A.Demeyer, D.Guinet, J.L.Charvet, M.Morjean, A.Peghaire, Y.Pranal, L.Sinopoli, J.Uzureau, R.de Swiniarski.
Nucl. Phys. A (Netherlands), vol.A407, no.1-2, p.233-54 (3-10 Oct. 1983).
The authors have measured at SARA the correlation of fission fragments produced in the reactions $^{20}Ne+^{197}Au$ and $^{20}Ne+^{209}Bi$ at 30 MeV/u. The results show that the most probable amount of linear momentum transferred from the projectile to the fissioning nucleus is about 80%. This corresponds to about 3.7 GeV/*c*. The fission cross section is still rather large at this bombarding energy: 1.6 ± 0.3 b for the Au target and 2.2 ± 0.5 b for the Bi one. They present the results of a Monte-Carlo simulation which allows them to reproduce most of the experimental data under certain conditions which are discussed. (17 refs.)

117586 Collisions to melt the vacuum. B.Willis (CERN, Geneva, Switzerland).
New Sci. (GB), vol.100, no.1378, p.9-12 (6 Oct. 1983).
Physicists now believe that they can create a new form of vacuum, resembling that of the early stages of the Universe. Far from being empty, this new vacuum is seething with elementary quarks and gluons. It may possibly be formed in collisions of high-energy nuclei. (no refs.)

117587 Unified band-crossing interpretation of $^{16}O+^{16}O$ inelastic reactions. K.Langanke, H.Friedrich, S.E.Koonin (W.K. Kellogg Radiation Lab., California Inst. of Technol., Pasadena, CA, USA).
Phys. Rev. Lett. (USA), vol.51, no.14, p.1231-4 (3 Oct. 1983).
A band-crossing model based on a microscopically derived $^{16}O+^{16}O$ potential and the Pauli principle is used to interpret data on $^{16}O+^{16}O$ reactions to eight inelastic channels. Structures observed in the cross sections are accounted for in all cases. (16 refs.)

117588 Resonances in elastic and inelastic scattering of $^{24}Mg+^{24}Mg$. R.W.Zurmuhle, P.Kutt (Dept. of Phys., Univ. of Pennsylvania, Philadelphia, PA, USA), R.R.Betts, S.Saini, F.Haas, O.Hansen.
Phys. Lett. B (Netherlands), vol.129B, no.6, p.384-6 (6 Oct. 1983).
Excitation functions for elastic and inelastic scattering of $^{24}Mg+^{24}Mg$ have been measured in 100 keV steps over the bombarding energy range 84-100 MeV. Strong narrow resonances are observed correlated in many channels. The data are compared with similar results for the $^{28}Si+^{28}Si$ system. (6 refs.)

117589 Pairing effects in quasi-elastic neutron transfer between tin isotopes. W.von Oertzen, B.Gebauer, A.Gamp, H.G.Bohlen (Hahn-Meitner-Inst. fur Kernforschung, Berlin, Germany), F.Busch, D.Schull.
Z. Phys. A (Germany), vol.313, no.3, p.189-95 (1983).
The transfer of neutrons between low-lying states of Tin isotopes has been measured in the reaction $^{120}Sn\rightarrow^{112}Sn$ at energies below the Coulomb barrier. The transfer probabilities are deduced as function of the classical minimum distance from transfer and scattering cross sections at different angles and two energies. At the smallest distances very large transfer probabilities, $P_t=0.5$, are observed for one- and two-neutron transfer. The two-neutron transfer is significantly enhanced as compared to a successive independent single-nucleon transfer. The definition of enhancement is discussed. (16 refs.)

25.80 MESON- AND HYPERON-INDUCED REACTIONS AND SCATTERING

117590 Energy dependence of the tensor polarisation t_{20} in $\pi^+ -d$ elastic scattering. V.Konig (Lab. fur Kernphys., Eidgenossische Tech. Hochschule, Zurich, Switzerland), A.Chisholm, W.Gruebler, J.Ulbricht, P.A.Schmelzbach, M.Merdzan, K.Elsener.
J. Phys. G (GB), vol.9, no.10, p.L211-15 (Oct. 1983).
The tensor polarisation t_{20} of the recoil deuterons from $\pi^+ -d$ elastic scattering has been measured between $T_\pi=110$ and 150 MeV. An excitation curve of t_{20} shows a clear peak near the mass 2.14 GeV with a structure 20 MeV wide. The angular distributions at 117, 134 and 151 MeV confirm the rapidly changing behaviour with energy. A phase-shift analysis of all $\pi^+ -d$ scattering data in this energy range has been performed. The strong energy and angular dependence are believed to manifest evidence for non-conventional dynamics. (8 refs.)

25.85 FISSION REACTIONS

117591 The measurement of absolute fission product yield for spontaneous fission of ^{252}Cf. Li Ze, Liu Conggui, Lu Huijun, Liu Yonghui, Wang Lianbi (Inst. of Atomic Energy, Acad. Sinica, Beijing, China).
Chin. J. Nucl. Phys. (USA), vol.5, no.3, p.226-38 (Aug. 1983). In Chinese.
The absolute fission product yields for spontaneous fission of ^{252}Cf are measured by Ge(Li) γ-ray spectrum method. The catcher foil technique is used for the first time in the absolute measurement of fission yields. The collection efficiency of catcher foil for fission fragments is studied precisely. 44 chain yields from ^{85}Kr to ^{157}Eu are obtained. Fractional independent chain yields of ^{134}I and ^{135}Xe are determined. They are 0.268 ± 0.048 and 0.086 ± 0.012, respectively. The authors' results are compared with those given in the literature. (22 refs.)

117592 Measurement of the prompt fission neutron multiplicity from the ^{245}Cm(n,f) and ^{242}Am(n,f) reactions. R.E.Howe, R.M.White, J.C.Browne, J.H.Landrum, R.J.Dougan, R.W.Lougheed, R.J.Dupzyk (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
Nucl. Phys. A (Netherlands), vol.A407, no.1-2, p.193-207 (3-10 Oct. 1983).
The prompt fission neutron multiplicity, $\bar{\nu}_p$, of ^{245}Cm was measured relative to that of ^{235}U using the neutron time-of-flight facility at the Lawrence Livermore National Laboratory (LLNL) 100 MeV electron linac. Incident neutron energies ranged from 0.05 eV to 14 MeV. In addition, a monoenergetic measurement of $\bar{\nu}_p$ for ^{245}Cm relative to ^{235}U was made at $E_n=14.1$ MeV using the LLNL Insulated Core Transformer (ICT) Neutron Source. Fission fragments were detected using a hemispherical ionization chamber containing ~200 μg of ^{245}Cm. A separate fission chamber contained 8.3 mg of ^{235}U. Fission neutrons were detected in liquid scintillators using pulse-shape discrimination to separate γ-rays from neutrons. The measurements reported here for ^{245}Cm are in agreement with each other and indicate an overall rate of increase in $\bar{\nu}_p$ with incident neutron energy which departs significantly from systematic trends. Interpretations are presented which suggest that these results are a consequence of changing fragment kinetic energies. Results from a concurrent measurement of $\bar{\nu}_p$ for ^{242m}Am at $E_n=14.1$ MeV are also included and agree with previously reported data. (17 refs.)

25.88 FUSION REACTIONS

117593 Low-energy fusion of $^{28}Si+^{12}C$. R.A.Racca, P.A.Deyoung, J.J.Kolata, R.J.Thornburg (Phys. Dept., Univ. of Notre Dame, Notre Dame, IN, USA).
Phys. Lett. B (Netherlands), vol.129B, no.5, p.294-7 (29 Sept. 1983).
Fusion cross sections have been measured for the $^{28}Si+^{12}C$ system over the energy range 60 MeV$\leq E(^{28}Si)\leq$90 MeV. Large structures in the total fusion yield are identified at $E_{cm}=19.6$, 20.6, 22.0, 23.9 and 25.1 MeV. Unlike most systems previously studied, the nucleon decay modes are largely responsible for these anomalies. The structures occur at successive integral values of angular momentum, but do not appear to correlate with known resonances in 180° elastic and inelastic scattering. (16 refs.)

117594 COMETHE-IIIJ predictions of the fuel centerline temperatures in the IFA-431, IFA-432, and IFA-513 assemblies. L.Rayes, S.Lee, E.Y.Lim, E.T.Rumble, A.Woodis.
Report EPRI-NP-2992, Electr. Power Res. Inst., Palo Alto, CA, USA (May 1983), 78 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USa.
Results are presented of a comparison of the centerline fuel temperature predictions provided by the COMETHE-IIIJ computer code to measurements obtained from 18 BWR fuel rods with in-fuel thermocouples. The error characteristics of the COMETHE-IIIJ are summarized, and performance of the code in this test and for predicting fuel temperatures in reload licensing submittals is determined.

117595 VIPRE-01: A thermal-hydraulic analysis code for reactor cores. Vol.III: Programmer's manual. C.W.Stewart, A.S.Koontz, J.M.Cuta, S.D.Montgomery.
Report EPRI-NP-2511-CCM, Electr. Power Res. Inst., Palo Alto, CA, USA (May 1983), 190 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
The authors present the programmer's manual for the VIPRE code, which was developed for nuclear power utility thermal-hydraulic analysis applications. The manual explains the structure of the code as well as the computer interfaces.

117596 Assessment, development, and application of LMFBR thermal-hydraulic analysis tools. W.P.Barthold, I.G.Barthold.
Report EPRI-NP-3167, Electr. Power Res. Inst., Palo Alto, CA, USA (July 1983), 150 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
The authors discuss an evaluation of the whole-core LMFBR thermal-hydraulics codes COBRA-WC, COMMIX, CORE-3D, CORTRAN, and SUPER ENERGY-2. The design analyst's point of view was used to consider basic algorithms, code capabilities, physical models, user instructions, and general code features. An expanded version of CORTRAN, CORTRAN-C, was developed and applied to the analysis of split inlet plenum designs. Orificing strategies for these designs were investigated.

117597 Numerical simulation of steam separators used in nuclear steam generators and reactor systems. Vol.II: User's manual. M.J.Vander Vorst.
Report EPRI-NP-3063-CCM, Electr. Power Res. Inst., Palo Alto, CA, USA (June 1983), 102 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
The author presents a user's manual for the SWIRL computer code, which simulates the fluid dynamics of a primary steam separator.

117598 Steam generator data base. W.Pearl, S.Sawochka.
Report EPRI-NP-3033, Electr. Power Res. Inst., Palo Alto, CA, USA (June 1983), 246 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
The authors discuss the development of a data base that will provide comprehensive information on the effects of different PWR designs, materials, and operating conditions on the various corrosion phenomena involved. A discussion of the computer service and software selection used for the compilation of the data is given as well as an analysis of the questionnaires and their transmittal to the cooperating units. The appendix provides details on the computational tools for data storage access, and investigation.

117599 Modeling air-water tests with DUVAL. R.S.Dougall.
Report EPRI-NP-3163, Electr. Power Res. Inst., Palo Alto, CA, USA (July 1983), 50 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
Comparisons of the DUVAL computer code predictions to data obtained in two-dimensional two-phase flow air-water experiments are presented. The report documents conservation equations simulating these flows. The comparisons indicate that the DUVAL computer code can accurately simulate these air-water experiments without heat addition.

117600 Computer calculated potential pH diagrams to 300°C. Vol. III: User's guide for the computer program POT-pH-TEMP. C.M.Chen, K.Aral.
Report EPRI-NP-3137, Electr. Power Res. Inst., Palo Alto, CA, USA (June 1983), 98 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
The authors present a user's guide for POT-pH-TEMP, a computer program to generate potential pH diagrams for many metal-water systems at various temperatures.

117601 Testing ENDF/B-V data for thermal reactors (Addendums 1, 2, 3). D.S.Craig.
Report AECL-7690, Atomic Energy Canada Ltd., Chalk River, Ont. (June 1983), 23 pp.
Four lattices have been added to those used to test the ENDF/B-V data for use with thermal reactors. One, LTRIIA, is a D_2O-moderated lattice of uranium fuel tubes arranged on a tight pitch. The other three, R1/100H, R2/100H and R3/100H, are H_2O-moderated lattices of UO_2. Two of these also have the fuel rods arranged on a tight pitch. The measurements made on LTRIIA are not consistent with each other and thus the lattice is not an ideal test lattice. However, calculations made at other laboratories using Monte Carlo and integral transport methods give different results. It was hoped that the calculations would help to resolve this difference. The choice of some of the input options and parameters for the OZMA code is discussed.

117602 Model investigations on core monitoring in large pebble-bed HTGRs using fast fission chambers in the top reflector. D.E.Carlson.
Report JUL-1853, Kernforschungsanlage, Julich, Germany (June 1983), 214 pp. In German.
The work presented is concerned with the detection of flux irregularities in large pebble-bed high-temperature reactors by means of measuring the fast (E_n>0.1 MeV) neutron flux distribution in the lower region of the top reflector. (35 refs.)

28.42 FISSION REACTOR MATERIALS

117603 Radiation protection aspects in permanent decommissioning of the N.S. 'Otto Hahn'. K.Henning (GKSS-Forschungszentrum Geesthacht GmbH, Geesthacht, Germany).
Atomwirtsch.-Atomtech. (Germany), vol.28, no.9, p.467-9 (Sept. 1983). In German.
After more than ten years of operation, the nuclear research vessel, N.S. 'Otto Hahn', was decommissioned in the period 1980 to 1982, i.e. dismantled and decontaminated to such an extent as to now contain only 'free areas' in the sense of the Radiation Protection Ordinance, which allows continued operation without a permit under the Atomic Energy Act of the vessel as a diesel operated commercial vessel. The case of the N.S. 'Otto Hahn' for the first time demonstrates for a nuclear plant, a complete nuclear waste management to the point of commercial re-use. (no refs.)

117604 A simple theoretical investigation of the effect of a moderator present in the central region of a hollow fuel element. A.Kakatsios, D.Leonidou (Lab. of Nuclear Engng., Nat. Tech. Univ., Athens, Greece).
Atomkernenerg. Kerntech. (Germany), vol.42, no.3, p.193-8 (1983).
In order to predict the thermal neutron flux increment in the fuel region of the cell, due to the transition from the situation without, to the one with a central moderator positioned in the central region of a hollow fuel element, a simple theoretical model is used in combination with several experimentally obtained magnitudes, taken in positions of the cell where access is possible. Though the theoretical model is based on the one group diffusion theory and on a number of simplifications, the proposed method gives results which are in a fair agreement with the experimentally obtained ones. (8 refs.)

117605 A probabilistic model for spent fuel management costs. P.Jauho.
Acta Polytech. Scand. Appl. Phys. Ser. (Finland), no.Ph138, p.63-5 (1983).
A probabilistic analytic model for spent fuel management costs is developed to enable a calculation of statistical properties of costs, charges, funding, etc. The model is based on insurance mathematics. (2 refs.)

117606 Ceramization of nuclear wastes with clay. J.K.Miettinen, J.Lehto.
Acta Polytech. Scand. Appl. Phys. Ser. (Finland), no.Ph138, p.132-6 (1983).
A new method to ceramize nuclear wastes with clay has been developed. Inorganic ion exchangers loaded with nuclear wastes were turned into final ceramic waste form by mixing them with a Finnish red clay in weight ratio 1:4 at maximum. The tiles moulded from the wet, bakeable mixture were ceramized at 1020-1060°C. The leach rates of Sr, Cs, and Co from the tiles determined by a dynamic ISO test were after six months of leaching $10^{-6}-10^{-7}$ g/cm^2×d, in decreasing order. Mechanically the tiles are very durable: flexural strengths were in the range of 20-45 meganewtons per square meter. (9 refs.)

117607 Assessment of flaw detection probability in the case of pressure vessel materials. H.Riikonen, J.Raussi, O.J.A.Tiainen.
Acta Polytech. Scand. Appl. Phys. Ser. (Finland), no.Ph138, p.159-64 (1983).
Shaffer has presented a method for assessing flaw detection probability in pressure retaining components. In this case study the usefulness of Shaffer's method is examined using inspection data from a BWR-plant piping and mathematical fittings for size distributions of detected flaws. It was seen that the size distribution function has to fulfil many conditions to be useful for assessing the detection probability of flaws. The discovery of a proper Shaffer's ω function appears to be the key factor for the usefulness of the model. (4 refs.)

117608 Leachability of radionuclides from radioactive waste solidified products. S.Seki (JAERI, Tokyo, Japan).
J. At. Energy Soc. Jpn. (Japan), vol.25, no.7, p.571-6 (July 1983). In Japanese.
From leach tests of cement solidified products containing ^{137}Cs and ^{60}Co, it was concluded that the leachability of radionuclides from radioactive waste solidified products can be treated as the diffusion control. In obtaining the diffusion coefficient, the radioactive waste products are classified in two groups, permeable and nonpermeable, respectively, and the diffusion equations suitable for the respective groups are proposed. Accordingly, using the diffusion coefficients derived, the method of long-term estimations on the amounts leached is also proposed. (12 refs.)

117609 Estimation of multicomponent breakthrough curves in soil environment. N.Katoh, K.Nakamichi (Kogakuin Univ., Tokyo, Japan), H.Tasaka, T.Asano.
J. At. Energy Soc. Jpn. (Japan), vol.25, no.7, p.577-82 (July 1983). In Japanese.
Breakthrough curves were experimentally obtained for Co, Sr, Cs, Co-Sr and Co-Sr-Cs systems to examine effects of co-existence of nuclides on the absorptivity of a soil. Results showed that the breakthrough curves of same nuclide differ considerably from single to binary and ternary component systems. These phenomena cannot be explained by Henry type isotherm theory which is dominantly used in the field of radioactive waste management. In the present study, based on Freundlich type isotherm and Radke-Prausnitz theory, estimation of breakthrough curves of multicomponent systems was carried out and good agreement was obtained between estimated and experimental results. The method proposed here enables one to estimate multicomponent nuclide migration in the groundwater only using single component adsorption parameters. (14 refs.)

117610 Gamma dose-rates from the maximum-rated spent fuel bundle in KANUPP. K.F.Mirza (Karachi Nuclear Power Plant, Karachi, Pakistan).
Nucleus (Pakistan), vol.20, no.1, p.11-17 (Jan.-March 1983). [received: Oct. 1983]
Gamma dose-rates in air have been determined from a maximum-rated spent fuel bundle at different distances from the bundle and at different times after its discharge from the reactor core. At different intervals the dominant contributions to radiation dose are caused by different sets of radionuclides e.g. Cs-134 contributes only 5.4% of the total dose at 27.8 hrs after discharge but its contribution increases to 85.2% after 11.6 months when the shorter-lived activities have decayed. (no refs.)

117611 Nuclear fuel conversion characteristics in a nuclear power station in a fuel cycle with two compositions of cycling fuel. G.B.Usynin, V.A.Chirkov, S.V.Zbrueva.
Vestsi Akad. Navuk BSSR Ser. Fiz. Energ. Navuk, no.3, p.10-14 (1983). In Russian.
Fast reactor operation with two compositions of consumed fuel is considered. Calculation results of a BN-1600-type reactor for different consumed plutonium compositions in small and large enrichment zones are reported. The presence of ^{240}Pu in the fuel is shown to result in the fuel self-compensation with the degree of self-compensation in the large enrichment zone being, on the average, less than that in the small enrichment zone. The method of calculating physical characteristics according to fuel balance is formulated, an equation for estimating the rate of the system growth is given. (2 refs.)

117612 Theoretical investigation of the operation of cermet fuel elements in a BRIG-300 fast reactor. I.S.Kulikov, V.B.Nesterenko, B.E.Tverkovkin.
Vestsi Akad. Navuk BSSR Ser. Fiz. Energ. Navuk, no.3, p.14-18 (1983). In Russian.
Presents the theoretical results on the operation of cermet fuel elements in a fast gas-cooled BRIG-300-type reactor. The investigations have been conducted at the Nuclear Power Engineering Institute of the Byelorussian Academy of Sciences. (9 refs.)

117613 Chromatographic determination of gas-like impurities in a dissociating coolant. V.V.Leonova, V.V.Gren'.
Vestsi Akad. Navuk BSSR Ser. Fiz. Energ. Navuk, no.3, p.33-5 (1983). In Russian.
The chromatography technique for determining gaseous impurities in nitrogen tetroxide is described. The gas-chromatographic system to determine nitrogen, nitrogen oxide, nitrous oxide and oxygen in the 0.03 g coolant sample with the analysis time of 12 min and method sensitivity of 10^{-3}% is presented. The parameters of seperation of the determined components are given. (3 refs.)

117614 Experimental investigation of heat exchange and hydraulic resistance during air flow in fuel element bundle cells. O.S.Vasilevich, L.I.Kolykhan, A.V.Sheinina.
Vestsi Akad. Navuk BSSR Ser. Fiz. Energ. Navuk, no.3, p.72-6 (1983). In Russian.
The enhancement of heat transfer in air flowing in the cells of fuel element bundles with S/d=1.08, 1.12, 1.13 and roughness in form of rectangular lateral ribs with height h=0.02, 0.03 mm and pitch t=0.75 mm has been investigated. The empirical expressions have been derived for evaluating drag

and heat transfer coefficients in the fuel elements bundles with artificial roughness in the test range of geometry and conditions parameters. (13 refs.)

117615 Analysis of creep rupture data for five multiheat alloys by the minimum commitment method using double heat term centering technique. S.S.Manson, U.Muralidharan.
Report EPRI-CS-3171, Electr. Power Res. Inst., Palo Alto, CA, USA (July 1983), 74 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA, USA.
The authors develop the heat term concept of adapting the minimum commitment method for characterizing individual heats of multiheat materials data. Programs permitting the use of desk top microcomputers are included. A preliminary study is presented to show that it is possible that the long-term characteristics of a particular construction material heat can be estimated to a high degree of accuracy using short-time data from that heat together with longer time data from other heats of the same material.

117616 LWR core materials performance program: Progress in 1981-1982.
Report EPRI-NP-3150-SR, Electr. Power Res. Inst., Palo Alto, CA, USA (July 1983), 144 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
This report describes the progress made in 1981 and 1982 by the EPRI Light Water Reactor Core Materials Performance Program. The active projects under this program range in scope from test reactor experiments of advanced fuel types to large-scale testing of prototypic fuel assemblies. During 1981 and 1982, several projects produced significant results in a number of areas. The primary emphasis continues to be on fuel reliability with demonstrations of extended fuel burnup capability receiving significant support.

117617 Analysis of test lattice experiments in the light water high-conversion reactor PROTEUS. E.Hettergott, R.Chawla, K.Gmur.
Report EPRI-NP-3190, Electr. Power Res. Inst., Palo Alto, CA, USA (July 1983), 62 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
The authors describe the preliminary analysis of a series of tight-pitch lattice experiments conducted at the PROTEUS zero-power reactor facility in Switzerland. Data is presented on a PuO_2/UO_2-fueled test lattice with a fuel-to-moderator ratio of approximately 2.0 Measurements include the capture rate in ^{238}U and fission rates in ^{235}U, ^{238}U, ^{239}Pu, and ^{241}Pu.

117618 Evaluation of BWR resin intrusions on stress corrosion cracking of reactor structural materials. R.J.Kurtz, D.W.Shannon, B.Francis, F.M.Kustas, P.L.Koehmstedt.
Report EPRI-NP-3145, Electr. Power Res. Inst., Palo Alto, CA, USA (June 1983), 70 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
The authors discuss a study of the stress corrosion and corrosion fatigue behavior of type-304 stainless steel when exposed to off-normal BWR water chemistry conditions. Normal high-purity BWR water and an impure BWR water that simulated ion exchange resin releases from the demineralizer system and their chemical conditions are evaluated.

117619 Optimization of metallurgical variables to improve corrosion resistance of Inconel alloy 600. G.P.Airey.
Report EPRI-NP-3051, Electr. Power Res. Inst., Palo Alto, CA, USA (July 1983), 304 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
Several aspects of the corrosion performance and characterization of thermally treated and mill-annealed alloy 600 tubing are studied. It is confirmed that special thermal treatment improves SCC of alloy 600. A model for improved SCC resistance is developed. The carbide dissolution and precipitation kinetics are confirmed, and the long-term low-temperature microstructural changes in alloy 600 are evaluated. Finally the author establishes suitable stress relief annealing parameters.

117620 Effect of localized waste-container failure on radionuclide transport from an underground nuclear waste vault. S.C.H.Cheung, T.Chan.
Report AECL-7796, Atomic Energy Canada Ltd., Chalk River, Ont. (July 1983), 13 pp.
In the geological disposal of nuclear fuel waste, one option is to emplace the waste container in a borehole drilled into the floor of the underground vault. In the borehole, the waste container is surrounded by a compacted soil material known as the buffer. A finite-element simulation has been performed to study the effect of localized partial failure of the waste container on the steady-state radionuclide transport by diffusion from the container through the buffer to the surrounding rock and/or backfill. In this study, the radionuclide concentration at the buffer-backfill interface is assumed to be zero. Two cases are considered at the interface between the buffer and the rock. In case 1, a no-flux boundary condition is used to simulate intact rock. In case 2, a constant radionuclide concentration condition is used to simulate fractured rock with groundwater flow. (8 refs.)

117621 Diffusional mass transport phenomena in the buffer material and damaged zone of a borehole wall in an underground nuclear waste vault. S.Page, S.C.H.Cheung.
Report AECL-7788, Atomic Energy Canada Ltd., Chalk River, Ont. (June 1983), 20 pp.
The effects of the geometry of the borehole and the characteristics of the damaged borehole rock wall on the movement of radionuclides from an underground nuclear waste vault have been studied. The results show that radionuclide transport will occur mainly through the buffer into the damaged zone of the borehole wall. As the degree of fracturing of the damaged zone increases, the total radionuclide flux will increase up to a limit which can be approximated by a one-dimensional radial diffusion model. For large degrees of fracturing of the damaged zone, an increase in the radial buffer material thickness will decrease the total flux, whereas, for small degrees of fracturing, an increase in the radial buffer thickness may slightly increase the total flux. Increasing the vertical buffer thickness will significantly decrease the total flux when the degree of fracturing of the damaged zone is small. An increase in the vertical extent of the damaged zone will cause an increase in total flux. (7 refs.)

117622 High-level waste glass field burial tests at CRNL: The effect of geochemical kinetics on the release and migration of fission products in a sandy aquifer. T.W.Melnyk, F.B.Walton, H.L.Johnson.
Report AECL-6836, Atomic Energy Canada Ltd., Chalk River, Ont. (June 1983), 53 pp.
In 1960 June, 25 nepheline syenite-based glass hemispheres containing the fission products ^{137}Cs, ^{90}Sr, ^{144}Ce and ^{106}Ru were buried below the water table in fluvial sand at the Chalk River Nuclear Laboratories of Atomic Energy of Canada Limited. Soil and groundwater concentrations of ^{90}Sr and ^{137}Cs have been determined since then and the data have been interpreted using kinetically limited migration models to deduce the leaching history of the glass for these burial conditions. The leaching history derived from the field data is compared to laboratory leaching of samples from a glass hemisphere retrieved in 1978, and also to pre-burial laboratory leaching of identical hemispheres. The time dependence of the leach rates observed for the buried specimens suggests that leaching is being inhibited by the formation of a protective surface layer, although no direct observation of this layer has been made. The effect of the kinetic limitations of the fission-product/fluvial-sand interactions is discussed with respect to the migration of ^{90}Sr and ^{137}Cs over a 20-a time scale. (28 refs.)

117623 Canadian nuclear fuel waste management program. T.E.Rummery, E.L.J.Rosinger.
Report AECL-7787, Atomic Energy Canada Ltd., Chalk River, Ont. (May 1983), 18 pp.
The Canadian Nuclear Fuel Waste Management Program is now well established. This report outlines the generic research and technological development underway in this program to assess the concept of immobilization and subsequent disposal of nuclear fuel waste deep in a stable plutonic rock in the Canadian Shield. The program participants, funding, schedule and associated external review processes are briefly outlined. The major scientific and engineering components of the program, namely, immobilization studies, geoscience research and environmental and safety assessment, are described in more detail. (58 refs.)

117624 Characterization of low and medium level radioactive waste forms. R.A.J.Sambell.
Report EUR 8663 EN, Comm. European Communities, Luxembourg (1983), vii+111 pp. Contract 235-81-13 WAS-DK, 240-81-13 WAS-D, 242-81-13 WAS-UK, 243-81-13 WAS-UK, 244-81-15 WAS-F, 245-81-15 WAS-B.
The work reported was carried out during the first year of the Commission of the European Community's programme on the characterization of low and medium level waste forms. Ten reference waste forms plus others of special national interest have been identified covering PWR, BWR, GCR and reprocessing wastes. The immobilising media include the three main matrices: cement, polymers and bitumen and a glass. Characterization is viewed as one input to quality assurance of the waste form and covers: waste-matrix compatibility, radiation effects, leaching, microbiological attack, shrinkage and swelling, ageing processes and thermal effects. The aim is a balanced programme of comparative data, predictive modelling and an understanding of basic mechanisms. (34 refs.)

117625 Ballooning of thin-walled tubes with an azimuthal temperature gradient. R.S.W.Shewfelt.
Report AECL-7799, Atomic Energy Canada Ltd., Chalk River, Ont. (Sept. 1983), 16 pp.
The analysis of the ballooning of thin-walled tubes with azimuthal temperature gradients is frequently simplified by assuming the cross section remains circular. To estimate the errors caused by this assumption, a two-dimensional model was developed to estimate the deviations from a circular cross section caused by an azimuthal temperature gradient. The deviations were found to be small for the azimuthal temperature distributions considered and, consequently, predictions made by assuming the cross section remains circular are adequate. (2 refs.)

117626 Parameter-sensitivity analysis of near-field radionuclide transport in buffer material and rock for an underground nuclear fuel waste vault. S.C.H.Cheung, T.Chan.
Report AECL-7801, Atomic Energy Canada Ltd., Chalk River, Ont. (Aug. 1983), 31 pp.
An analytical model has been developed for radionuclide transport in the vicinity of a nuclear fuel waste container emplaced in a borehole. The model considers diffusion in the buffer surrounding the waste container, and both diffusion and groundwater convection in the rock around the borehole. A parameter-sensitivity analysis has been done to study the effects on radionuclide flux of (a) Darcian velocity of groundwater in the rock, (b) effective porosity of the buffer, (c) effective porosity of the rock, (d) radial buffer thickness, and (e) radius and length of the container. (14 refs.)

28.42H Fuel preparation and reprocessing

(inc. isotope separation and enrichment)

117627 Advanced isotope separation. Nuclear chemistry for the 21st century. C.B.Stevens (Fusion Energy Found., New York, NY, USA).
Fusion (USA), vol.5, no.2, p.36-41 (Dec. 1981). [received: Sept. 1983]
Isotope separation has been the key to the development of the most advanced frontiers of 20th-century science and technology, in particular nuclear fission and fusion. If declassified and fully developed with the aid of plasma bombardment, it will cheapen energy production and revolutionize materials science. (no refs.)

117628 Substoichiometric extraction of thorium with PMBP. Yu Yufu, Tang Jingjuan, Ye Minglu (Dept. of Nuclear Sci., Fudan Univ., Shanghai, China).
He Huaxue Yu Fangshe Huaxue (China), vol.4, no.4, p.228-33 (Nov. 1982). In Chinese. [received: Sept. 1983]
In studying the substoichiometric extraction of thorium with 1-phenyl-3-methyl-4-benzoyl-pyrazolone-5 (PMBP), it was found that thorium can be extracted substoichiometrically by $5.0\times10^{-4}M$ PMBP-xylene solution in the range of pH 4.5-5.5. Thorium in synthetic mixture solution and ore samples was determined by substoichiometric isotope dilution method and the preliminary results were presented. (13 refs.)

117629 Monitoring plutonium enrichment in mixed-oxide fuel pellets inside sealed nuclear fuel pins by neutron radiography. J.K.Ghosh, J.P.Panakkal, P.R.Roy (Radiometall. Div., Bhaba Atomic Res. Centre, Bombay, India).
NDT Int. (GB), vol.16, no.5, p.275-6 (Oct. 1983).
The possibility of using neutron radiography for monitoring plutonium enrichment in mixed-oxide fuel pellets inside welded fuel pins has been explored. Neutron radiographs of pellets containing 0-6% weight PuO_2 have been analysed by microdensitometry. The optical density of the radiographs has been correlated to the compositional variations in the fuel pellets studied. Analysis of the experimental results in presented. (6 refs.)

117630 Third-order aberration-free ion-optical system for an electromagnetic isotope separator. I.Chavet.
Report IA-1379, Israel Atomic Energy Comm., Tel Aviv (Dec. 1982), 9 pp.
The essential qualities required of a production isotope separator are high output and high enrichment factor. For this purpose, the imaging system should have as little geometric aberration as possible. In the proposed system, consisting of a homogeneous sector-type analyzing magnet, the beam is crossed in the axial direction at the entrance boundary of the magnetic field and the incidence to this boundary is normal. It is shown that for this case all radial aberrations to the 'practical' third order can be eliminated provided four optical conditions are satisfied: two related to heterogeneous aberrations terms in addition to the two conditions related to the second and third order homogeneous aperture aberration terms. The resulting equations take into account the magnetic fringe-field effects to the third order. (5 refs.)

28.43 FISSION REACTOR OPERATION

117631 Performance of platinum self-powered neutron detectors in the simulated conditions of a pressurized water reactor. A.A.Kendoush, S.M.Al-Jobori, H.H.Ahmed, H.Z.Mohamed (Iraqi Atomic Energy Comm., Tuwaitha-Baghdad, Iraq).
Atomkernenerg. Kerntech. (Germany), vol.42, no.3, p.174-6 (1983).
An experiment was designed to investigate the performance of platinum emitter SPNDs. The SPNDs were irradiated in the periphery of Osiris reactor for 3 cycles. The range of operating temperature in the experiment was (250-400)°C. Measurements were obtained for the sensitivity, linearity, response, stability and temperature effects of Pt SPNDs. It was found that the operation of the 0.5 mm emitter diameter was more reliable than the 1.0 mm emitter diameter during the increase in the operating temperature. (9 refs.)

117632 Cooldown performance capability of atmospheric steam dump system. J.D.Harris (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Nucl. Saf. (USA), vol.24, no.4, p.471-84 (July-Aug. 1983).
The steam generator atmospheric steam dump (ASD) system is evaluated to assess its thermal-hydraulic ability to cool down the reactor coolant system and steam generators following a design basis event (DBE) in which the main steam isolation valves close. A number of pressurized-water reactors are examined to evaluate ASD system performance within the constraints of the available licensing feedwater supply. Calculations using Final Safety Analysis Report data show that, although the ASD system is vital for safety following a DBE, design inadequacies exist which indicate unresolved safety and licensing issues at a number of operating plants. (38 refs.)

117633 Prevention and mitigation of steam generator water hammer events in PWRs. J.T.Han, N.Anderson.
Nucl. Saf. (USA), vol.24, no.4, p.533-7 (July-Aug. 1983).
Water hammer in nuclear power plants is an unresolved safety issue under study by the Nuclear Regulatory Commission (NRC). The authors summarize (1) the causes of steam generator water hammer (SGWH) events in pressurized-water reactors (PWRs), (2) various methods used to prevent or mitigate SGWH events, and (3) modifications that have been made at each operating PWR. (14 refs.)

117634 REWET-II facility for experiments on the loss-of-coolant accident in nuclear reactors. H.Kalli, T.Kervinen, A.Hamalainen.
Acta Polytech. Scand. Appl. Phys. Ser. (Finland), no.Ph138, p.66-71 (1983).
REWET-II is an experimental facility for studies of the reflood phase during a loss-of-coolant accident. The emphasis is on simulation of the pressurized water reactors in use in Finland. The facility, its scaling principles, main measurements and fuel rod simulators are described. The simulator rods are compared with the real fuel rods by computer. The difference in the behavior of the rods is explained and discussed. (5 refs.)

117635 Heat and mass transfer in a disperse nonequilibrium chemically reacting two-phase flow in a vertical channel. V.A.Nemtsev.
Vestsi Akad. Navuk BSSR Ser. Fiz. Energ. Navuk, no.3, p.46-50 (1983). In Russian.
A one-dimensional mathematical model for heat and mass transfer of a dispersed two-phase nonequilibrium chemically reacting N_2O_4 flow in a vertical channel has been elaborated. The influence of chemical reaction kinetics on the basic characteristics of a steam generating channel in the second-kind burnout region has been investigated. (4 refs.)

117636 A review of condensate demineralizer regeneration procedures. D.P.Siegwarth, K.A.Friedman, D.A.McNea.
Report EPRI-NP-2975, Electr. Power Res. Inst., Palo Alto, CA, USA (April 1983), 68 pp.
Available from Research Report Centre, Box 50490, Palo Alto, CA 94303, USA.
Performance of deep-bed condensate demineralizers for sodium chloride removal from condensate was evaluated in the laboratory for several different regeneration procedures. Sodium and chloride removal efficiency data, sulfate throw, and resin analysis results are presented. Condensate polisher design and operating guidelines are provided that emphasize good resin separation—identified as the factor responsible for positive laboratory results—in order to achieve water quality meeting PWR Secondary Water Chemistry Guidelines.

117637 Chemical cleaning process evaluation - Westinghouse steam generators. W.F.Cleary, G.B.Gockley.
Report EPRI-NP-2987, Electr. Power Res. Inst., Palo Alto, CA, USA (April 1983), 140 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
The authors present an assessment by Westinghouse Electric Corporation of the results of laboratory work and demonstration testing for developing a generic chemical cleaning process for the secondary side of PWR steam generators. In addition, recommendations are provided for methods of transferring the generic process to a Westinghouse plant-specific application, and the report identifies chemical cleaning corrosion guidelines for the construction materials in Westinghouse steam generators.

117638 Evaluation of secondary-system layup and cleanup practices and processes. W.F.Cleary.
Report EPRI-NP-2977, Electr. Power Res. Inst., Palo Alto, CA, USA (April 1983), 120 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
The study of PWR secondary-system layup and cleanup practices, undertaken to evaluate current and proposed methods of corrosion-product control associated with extended plant outages, is summarized. The study includes a field survey of 14 representative PWR plants, an extensive literature search, and an evaluation of corrosion-product transport data. Recommendations for layup and cleanup system processes are derived from these practices and related information, and the layup and cleanup system process design information is provided.

117639 Design and testing of a laboratory gamma-ray densitometer for two-phase flow. M.Herschthal, M.Kawaji, S.Banerjee.
Report EPRI-NP-2819, Electr. Power Res. Inst., Palo Alto, CA, USA (April 1983), 70 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
A scanning narrow-beam gamma-ray densitometer, developed for measurements of void profiles during reflood, is described. The design principles, details of construction, and experiments to calibrate the densitometer are presented.

117640 State-of-the-art evaluation of condensate polisher performance. S.J.Elmiger, S.J.Potterton.
Report EPRI-NP-2978, Electr. Power Res. Inst., Palo Alto, CA, USA (April 1983), 386 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
The authors document the methodology used for the results of a detailed survey conducted at 142 operating power plants to determine the capabilities and limitations of current generation condensate polisher systems. Results indicate that condensate polishers can be (and are being) designed and operated to produce the high-quality feedwater required in current generation power plants.

117641 Two-phase flow characteristics during controlled oscillation reflooding of a hot vertical tube. Y.S.Ng, S.Banerjee.
Report EPRI-NP-2821, Electr. Power Res. Inst., Palo Alto, CA, USA (May 1983), 98 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
The authors present the results of experiments performed to determine the transient void fraction in a heated vertical tube under oscillatory inlet flow conditions. Experimental results are discussed for oscillations of various amplitudes and periods, which were superimposed on a constant feed rate. In addition, measurements made of temperatures, void fraction, and mass carry-over are given.

117642 Ultrasonic enhancement of chemical cleaning of steam generators. T.Scharton.
Report EPRI-NP-2997, Electr. Power Res. Inst., Palo Alto, CA, USA (April 1983), 290 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303. USA.
The results of an investigation into the use of ultrasound to enhance the chemical cleaning of steam generator tube and support crevices are presented. Focus is placed on the coupling of the transducers to the wrapper plate, the transmission of sound through the tube bundle, and the determination of cavitation threshold levels. The testing demonstrated that ultrasonics is an effective means of enhancing the crevice cleaning if sound levels sufficient to cause cavitation can be transmitted to the crevices.

117643 Analysis of sludge from Indian Point 3. C.L.Nealy, M.M.Klenck.
Report EPRI-NP-3027, Electr. Power Res. Inst., Palo Alto, CA, USA (June 1983), 62 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
Detailed chemical analyses of samples of Indian Point 3 PWR steam generator sludge are presented. The entire chemical analyses are described, primary sludge components as well as observed elements at levels of 1.2% and less than 1% are identified, and the separation and subsequent analysis of an anion and a cation resin fraction are discussed in detail.

117644 In situ calibration of nuclear plant platinum resistance thermometers using Johnson noise methods. T.V.Blalock, R.L.Shepard.
Report EPRI-NP-3113, Electr. Power Res. Inst., Palo Alto, CA, USA (June 1983), 142 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
Three methods are presented for in situ calibration of reactor plant platinum resistance thermometers using Johnson noise measurements were tested in the laboratory and in operating Diablo Canyon and Sequoyah nuclear plant reactors. Results of tests designed (1) to investigate these in situ calibration

methods, (2) to determine possible error uncertainties and to quantify their effects, and (3) to identify future research areas in Johnson noise thermometry are reviewed. Calibration test results are detailed.

117645 Pressurized fluidized-bed combustion cycle screening study. J.C.Dille, P.A.Berman.
Report EPRI-CS-3151, Electr. Power Res. Inst., Palo Alto, CA, USA (July 1983), 138 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
Results are provided of a study, which focused almost exclusively on thermodynamic performance, that was conducted to evaluate a large number of different pressurized fluidized-bed combustion plant configurations in order to identify performance trends. The best candidates for mid-term development and for near-term utility application are reviewed, and a parametric sensitivity study showing the effect of key parameters on the performance of the most promising cycles is included.

117646 High-reliability condenser design study. Y.G.Mussalli, R.J.Bell, A.M.Impagliazzo.
Report EPRI-CS-3200, Electr. Power Res. Inst., Palo Alto, CA, USA (July 1983), 250 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
The authors present a review of US and European condenser designs and practices in order to recommend improvements and further research needs. Condenser integrity, deaeration, and thermal performance are discussed as well as designs to improve performance of condenser-associated systems, including macro- and micro-fouling control technologies and improved cooling-water pump designs. Several areas for research are identified.

117647 Crevice corrosion of lattice support alloys in secondary environments of nuclear steam generators. M.C.H.McKubre, S.C.Leach, L.E.Eiselstein.
Report EPRI-NP-3045, Electr. Power Res. Inst., Palo Alto, CA, USA (July 1983), 140 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
This report summarizes a study to determine the extent to which galvanic coupling effects are significant for initiating and sustaining corrosion in crevices. Particular emphasis is placed on determining how crevice and bulk water chemistry affect the corrosion rate. Experiments in a single-pass flow tube containing 14 specimens in different crevice geometries are described. Corrosion of support alloys is related to alloy content and pH.

117648 PWR model steam generator corrosion studies. R.M.Rentler, J.W.KLisiewicz, K.E.Marugg, J.K.Hayes, E.E.Grondahl.
Report EPRI-NP-3138, Electr. Power Res. Inst., Palo Alto, CA, USA (June 1983), 220 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
Results of a series of high-temperature heat transfer corrosion tests, designed to examine the effects of water chemistry variations on steam generator material corrosion, are reported. Details are provided of the four-year testing effort, which was carried out in four-tube low-heat-flux pot boilers and in multitube model steam boilers and which focused on the role of specific impurities relative to the corrosion of carbon steel support structures as well as a laboratory production of tube denting.

117649 Steam generator chemical cleaning: Demonstration test in a model boiler. G.C.Fink, M.H.Helyer, G.L.Key, D.B.Scott.
Report EPRI-NP-2990, Electr. Power Res. Inst., Palo Alto, CA, USA (June 1983), 312 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
Results of the final demonstration testing of the Steam Generator Owners Group generic chemical cleaning process, developed to chemically remove steam generator corrosion-product accumulants, are documented. Evaluation of the effectiveness of the process for (1) high-copper-content sludge removal and (2) cleaning of dented tube support crevices and the quantification of the corrosivity of the process to the generator base metals are reported.

117650 Added mass computation for impellers in nuclear power pumps. W.K.Liu, D.Lam, T.Belytschko.
Report EPRI-NP-3202, Electr. Power Res. Inst., Palo Alto, CA, USA (July 1983), 82 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
The authors present results of a study conducted to examine the fluid forces in the shaft and impeller regions of a pump and focuses on a method developed for calculating the effect of the hydrodynamic mass on the impeller stage of the rotor. Details are provided on the method, and a comparison of this method, which includes an accurate, three-dimensional representation of the impeller shape and the pump geometry as well as the effects of the velocity of the fluid, is made with previous approaches and current practices.

117651 Evaluation and improvement of PWR secondary-system oxygen control measures. A.D.MacArthur.
Report EPRI-NP-3020, Electr. Power Res. Inst., Palo Alto, CA, USA (July 1983), 502 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA, USA.
The author studies the design and operation of balance-of-plant systems and components to minimize oxygen-induced corrosion in the secondary systems of PWRs are presented. Recommendations for equipment and design options, as well as associated costs for making plant modifications that would correct the air inleakage in most plants are suggested. Details are provided on an evaluation of the use of hydrazine to scavenge oxygen in secondary systems and on recommendations for operating and maintenance practices.

117652 Condensate polishing at Surry Nuclear Power Station. D.A.McNea, D.P.Siegwarth, K.A.Friedman, S.G.Sawochka.
Report EPRI-NP-3037, Electr. Power Res. Inst., Palo Alto, CA, USA (June 1983), 114 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.
Results are presented of a detailed study conducted at the Surry Nuclear Power Station to evaluate the capability of the deep-bed condensate polisher systems to achieve water quality to meet the PWR Secondary Water Chemistry Guidelines. Polisher operation during normal operation and during periods of simulated condenser cooling-water inleakage is analyzed. Additionally, the results of less extensive site studies at the Ginna and Trojan nuclear stations are documented.

117653 Method of predicting pressure profiles in horizontal 37-element clusters. C.W.Snoek, S.Y.Ahmad.
Report AECL-8065, Atomic Energy Canada Ltd., Chalk River, Ont. (May 1983), 22 pp.
A new two-phase friction multiplier correlation has been developed to predict the pressure profile in two-phase flow with heat addition. The main difference from other pressure drop prediction routines is that in addition to the effect of quality, the effects of system pressure, heat and mass flux on the two-phase multiplier are included. The inception of two-phase flow is defined to occur at the onset of significant void in the subcooled boiling regime instead of the boundary between negative and positive thermodynamic equilibrium quality. Pressure drop data from an experiment with a fully segmented 6-metre long, 37-element fuel string were used to optimize the constants and exponents of this correlation for the friction multiplier. The authors present the derivation of the equations in a systematic manner. The effects of the system parameters on the prediction error are discussed in detail. (14 refs.)

117654 Measurements of fast neutron fluxes in HTR-OTTO-core configurations and comparison with theoretical calculations (Detection of flux perturbation). M.Khamis.
Report JUL-1852, Kernforschungsanlage, Julich, Germany (June 1983), ii+145 pp. In German.
Measurements of the absolute fast neutron fluxes and reactor power have been carried out on the critical facility KAHTER in the Institute for Reactor Development at the Kernforschungsanlage Julich GmbH. The Once Through Then Out core loading schemes OTTO 0/5 and OTTO 5/5 for the pebble-bed HTGR were investigated. The measurement results with the threshold detectors Rh^{103} and In^{115} as well as with U^{235}-, Np^{237}- and Th^{232}-fission chambers have been compared to calculations with the program cycles GAMTEREX and MUPO-CITATION. A further task was to check for statistical effects of the pebble-bed loading on the consistency of the measured values. Experiments with fast fission chambers were also performed to investigate the detectability of various flux perturbations in the upper core region by means of a detector system in the top reflector. (64 refs.)

117655 A surveillance system for nuclear reactors based on sequential pattern recognition methods. E.Saedtler (Gesellschaft fur Reaktorsicherheit mbH, Garching, Germany).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.323-32 vol.3
Discusses a surveillance system for nuclear power reactors based on sequential pattern recognition and large scale identification techniques. Bayes' decision theory is introduced and a maximum-a-posteriori filter algorithm is used compared with a multilevel structuring of the model, to estimate the likelihood ratios for a M-ary hypothesis test. With these procedures a computer controlled vibration monitoring and instrumentation surveillance system for power plants shall be realized. An empirical model is developed and some results, achieved with real data, are presented. A multimicroprocessor architecture for the surveillance problem is briefly described. (4 refs.)

117656 A new tool for nuclear reactor diagnostics. J.Valko, L.Zeke (Central Res. Inst. for Phys., Hungarian Acad. of Sci., Budapest, Hungary).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.333-42 vol.3
Presents a description of the architecture of a very fast digital signal analyser system (DSAS) for stand alone or computer controlled data processing. The special measuring environment has profound implications on the design of the DSAS. Attention is directed primarily to the modular architecture requirements of DSAS in order to achieve high real-time speed and intelligent data handling. (5 refs.)

117657 Broader utilization of programmable automation equipment in French nuclear power plants: reflections on the choices made by Electricite de France and French designers. Y.Baudry, G.Varaldi (Electricite de France, Paris, France).
Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium, Munich, Germany, 11-15 Oct. 1982 (Vienna, Austria: IAEA 1983), p.3-11 In French.
More than 1000 microprocessors and more than 10000 data memories in each of the twenty or so 1300 MW units in the French nuclear programme: that was the decision taken by Electricite de France (EDF) in conjunction with the designers in 1974, with the intention of introducing programmable automata on a wide scale in French nuclear power plants. Having used computers for linking sequences (themselves carried out with electromagnetic technology) for its latest natural-uranium gas-cooled graphite-moderated power plants, EDF decided to call a temporary halt, in the case of its 900 MW light-water range, to the use of digital techniques for the control and automation of power plants although it continued to employ such techniques widely in data processing. Thus, the widespread introduction of programmable automata led EDF and French designers to undertake a major development effort in order to meet the requirements—particularly safety and reliability requirements—for such automata to be incorporated into the nuclear field. The authors consider how this choice fits in with the logical evolution of the digitalization of French nuclear power plants and the problems it has caused for EDF and French industry. (6 refs.)

117658 Application of integrated detection systems for in-core instrumentation of nuclear power plants. J.Kott (Skoda Concern, Plzen, Czechoslovakia), V.Krett.
Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium, Munich, Germany, 11-15 Oct. 1982 (Vienna, Austria: IAEA 1983), p.13-20
On the basis of results of research and development, the advantages and disadvantages of detection systems for in-core reactor instrumentation are evaluated. The technological feasibility and the application of such systems are discussed as well as their potential economic benefits. The authors present long-term research and development results for such systems which are intended to measure physical and thermotechnical core parameters in a fuel assembly. Experience gained with these systems is discussed, together with their evaluation in an operational nuclear power reactor. The systems make it possible to determine experimentally the basic safety characteristics by means of measuring the coolant flow, pressure and pressure pulsations, neutron flux, heat generation, and heat of coolant and fuel assembly surfaces, enabling an exact determination of the fuel assembly heat output. (5 refs.)

117659 Improving 900 MWe PWR control rooms. M.Bouat, R.Marcille (Electricite de France, Paris, France), J.L.Testud, D.Viard.
Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium, Munich, Germany, 11-15 Oct. 1982 (Vienna, Austria: IAEA 1983), p.33-42 In French.
Analyses of the behaviour of operators during operating tests on PWR units and the lessons learned from the TMI-2 accident have demonstrated the need to improve the interface between operators and the facilities they control. To that end, and to complement its establishment of safety panels, Electricite de France (EDF) embarked upon a study on the 'Modification of Control Desks and Boards' in control rooms. This study, involving twenty-eight 900 MW(e) units, almost all of which are currently in service, began with an ergonomic analysis of control rooms. This analysis was based on interviews with simulator instructors and operators, a study of the operation of the unit, and a general review of previous studies. It resulted, in April 1981, in a critical report and a proposal to create a full-scale mock-up of a 900 MW(e) control room. The alterations to be made will make it necessary to revamp the control panels completely. The work and tests involved should match the duration of refuelling shut-downs. (no refs.)

117660 Control-room mock-up for the Philippsburg nuclear power plant, unit 2. M.Gamer (Badenwerk AG, Karlsruhe, Germany), E.Jager, G.Wohrle.
Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium, Munich, Germany, 11-15 Oct. 1982 (Vienna, Austria: IAEA 1983), p.43-56
The authors describe the major aspects of the construction of a full-scale control-room mock-up for Unit 2 (1300 MW PWR) of the Philippsburg nuclear power plant. The multitude of monitoring and control systems, co-operative control-room modelling by the planning staff as well as the operating staff, including the feedback of experience gained during operation, and the practice-oriented application of human factors engineering, especially the optimization of the man/machine interface, are emphasized. The most important improvements in the application of human factors engineering in process instrumentation and control are listed. The consequent structuring of mimic diagrams and instruments both by colour and shape is a fundamental step. A computerized operator support system has been installed with the aim of improving the man/machine interface. (8 refs.)

117661 Exchange of plant computers at Ringhals 1: system philosophy and orgnaizational requirements. B.-M.Jacobsson (Swedish State Power Board, Vallingby, Sweden).
Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium, Munich, Germany, 11-15 Oct. 1982 (Vienna, Austria: IAEA 1983), p.97-106
The author describes work in connection with the exchange of the plant computers at the Ringhals nuclear power plant. The new systems will contain the functions of the old system as well as some new functions. They will have to provide information for the 'Safety Panel' and the 'Technical Support Centre'. The author emphasizes the requirements to be met by the buying organization in order to be able to specify, install, verify, use and maintain such a system. (no refs.)

117662 Decision-making aid for operational crews: status of the EPRI DASS project. A.J.Spurgin, D.G.Cain, A.B.Long (Electric Power Res. Inst., Palo Alto, CA, USA).
Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium, Munich, Germany, 11-15 Oct. 1982 (Vienna, Austria: IAEA 1983), p.111-29
The authors consider recent work on the development of the disturbance analysis and surveillance system (DASS) of the Electric Power Research Institute (EPRI), Palo Alto. The work at EPRI covered a BWR application and the development of advance concepts as applied to a PWR. The authors start by considering the environment in which the DASS developments are taking place, especially the effect of observations resulting from evaluations of the safety parameter display system (SPDS) in actual control rooms. It is pointed out that insights are being gained into the behaviour of reactor control room crews. Both the philosophy and characteristics of the displays for the PWR and BWR DASS applications are discussed and pictures of the actual displays are included. The development and execution of a human factors plan is an integral part of the EPRI DASS programme and some discussion of the plan is included. It is concluded that there is a need for DASS-type systems and that such systems might be developed from an enhanced SPDS which would include the newly proposed emergency procedures based on identification of symptoms rather than events. (13 refs.)

117663 Computer-aided core surveillance and control. D.Beraha, A.Hoeld, O.Lupas (Gesellschaft fur Reaktorsicherheit mbH, Garching, Germany), O.Berg, K.Haugset, S.Hval, R.Moen, U.Scot Jorgensen.
Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium, Munich, Germany, 11-15 Oct. 1982 (Vienna, Austria: IAEA 1983), p.131-50
The purpose of the core surveillance and control system described is to provide the operator with relevant information on the actual core state, to predict core behaviour in transient situations, to determine strategies for control of both power and power distribution, and to realize these strategies in an online control mode. Thus, the safety of the plant is improved since undesired core conditions can be prevented more easily. An outline of the main tasks of a core surveillance system is given, followed by a description of the modules developed, namely core simulators in the core follow mode and predictive mode, strategy generators, databases, and interactive operator communication. (23 refs.)

117664 Application of artificial intelligence to the detection and diagnosis of core faults in fast reactors. G.le Guillou, C.Berlin (CEA, Centre d'Etudes Nucleaires de Cadarache, Saint-Paul-lez-Durance, France), J.-P.Parcy.
Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium, Munich, Germany, 11-15 Oct. 1982 (Vienna, Austria: IAEA 1983), p.173-86 In French.
An automatic diagnostic system designed specially for fuel assembly accidents in fast reactors of the French type is described. It has an 'expert system' structure and, at the present stage of the project, is operating on a laboratory scale in an experimental unit (Solar 16/65). The software aspects of the development of such systems (structure and formulation of rules, language, etc.) are presented in detail. Various simulation tests are outlined. 'Real-time' application of the system will begin in 1983 on the Phenix reactor. (15 refs.)

117665 Diagnostic technologies for PWR plants in Japan. T.Masui (Mitsubishi Atomic Power Industries Inc., Tokyo, Japan), H.Morimoto, T.Ogino.
Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium, Munich, Germany, 11-15 Oct. 1982 (Vienna, Austria: IAEA 1983), p.203-22
The improvement of the reliability and availability of nuclear power plants is an important subject. In this connection, it is of special importance to try and improve man-machine interfaces, i.e. to collect, systematize and diagnose the vast amount of plant information and to assist plant operators in the proper operation of nuclear power plants. The authors outline the diagnostic techniques of a computerized operator support system for PWR nuclear power plants under development as part of a five-year project. This project was initiated in 1980 and is supported by the Japanese Ministry of International Trade and Industry (MITI). The detection of abnormal conditions, the diagnostic prediction function and the system configuration are outlined. (3 refs.)

117666 STAR disturbance analysis system. W.Bastl (Gesellschaft fur Reaktorsicherheit mbH, Garching, Germany), R.Heinbuch, M.Kraft.
Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium, Munich, Germany, 11-15 Oct. 1982 (Vienna, Austria: IAEA 1983), p.223-33
The STAR application in the Grafenrheinfeld 1300 MW(e) PWR has been completed. The system was to inform the operators of disturbances, their causes and their consequences. The project was to show feasibility as well as realizability of the above goals by means of a process computer. The authors describe the results achieved and the problems that have arisen. Based on the experience of this application, further investigations, recommendations and research work is proposed. (8 refs.)

117667 Development of a computerized operator support system. H.Yoshitoshi (Mitsubishi Heavy Industries Ltd., Tokyo, Japan), K.Noh, Y.Hirakochi, Y.Okamoto, M.Itoh, K.Monta.
Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium, Munich, Germany, 11-15 Oct. 1982 (Vienna, Austria: IAEA 1983), p.235-49
A project for the development of a computerized operator support system (COSS) was initiated in 1980 and is supported by the Japanese Ministry of International Trade and Industry. This five-year development project covers BWR and PWR plants. The conceptual designs for these systems have been established and the detailed designs are being completed and implemented. The prototype systems will be tested and validated using large-scale plant simulators especially built for this project. The authors present the results of conceptual design, mainly with regard to monitoring, diagnosis and operational guidance technologies. The system will cover normal plant operation as well as abnormal, transient and accident modes. The outline of the system configuration and the method of verification with a plant simulator are also discussed. It is expected that the completed project and the application of COSS in nuclear power plants will contribute considerably to increased reliability and availability of these plants. (10 refs.)

117668 Analysis of the operator's tasks: an aid to control room design. P.Blanc, G.P.Guesnier (Electricite de France, Paris, France), B.Heilbronn, B.Monnier.
Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium, Munich, Germany, 11-15 Oct. 1982 (Vienna, Austria: IAEA 1983), p.251-63 In French.
In order to study and design control rooms for its future PWR units, Electricite de France analysed the operator's tasks. By analysing the control procedures of the 900 MW PWR units already in operation, a data base describing the control and monitoring tasks performed by operators in normal, incident and accident situations has been built up. The database files, which were established from a study of 130 control procedures, record all the commands given and data available in the control room (about 7000), describe the tasks connected with these commands and data, and identify the times at which they are made use of by the operator. Using this database, the principle of operator-system communication and of data processing in the control room of the future has been established: in such a control room, most controls and data will be accessible through computer communication systems to ensure that control and monitoring systems are closely integrated under normal operating conditions as well as in incident and post-accident situations and to enable the plant to be controlled by one or two operators in a seated position. (no refs.)

117669 An approach to the design of an advanced control centre. K.Subramaniam, R.N.Ray (Reactor Control Div., Bhabha Atomic Res. Centre, Trombay, Bombay, India).
Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium, Munich, Germany, 11-15 Oct. 1982 (Vienna, Austria: IAEA 1983), p.265-84
Control-room design deficiencies are to a considerable degree responsible for operator errors that lead to accident situations in nuclear reactors. The consideration of human factors, coupled with the use of advanced computer and display technology, result in optimum integration of the operator in the process. The authors describe the methodology adopted for the design of an advanced control centre for Indian PHWRs. The design of a human-engineered safety centre for the Narora PHWR station is discussed; stepwise schematic flow diagrams were used on the basis of an analysis of the safety functions. The factors involved in the design and validation of the operator-process interface are also outlined. Cathode ray tube displays are used as the main information display media in the advanced control centre. Displays ranging from macroviews of the plant systems to microviews of plant components help the operator in monitoring, control and diagnosis tasks. Human factors to be considered in the design of effective display formats are discussed and design guidelines summarized. (7 refs.)

117670 Defence in depth by 'Leittechnique' systems with graded intelligence. W.Aleite (Kraftwerk Union AG, Erlangen, Germany).
Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium, Munich, Germany, 11-15 Oct. 1982 (Vienna, Austria: IAEA 1983), p.301-19
In the past, only two types of nuclear power plant instrumentation and control systems were in use in the Federal Republic of Germany (FRG): safety systems and operational systems. Present nuclear power plant 'Leittechnique' systems in the FRG have been expanded to multiple-grade systems with respect to safety, qualification requirements and intelligence. The extensive experience of the past has encouraged differentiation between the protection limitations and condition limitations of the reactor protection system on one hand and the information systems (including the accident monitoring and alarm system) of different safety importance on the other. This simplifies the introduction of computerized equipment, especially in the lower safety categories. Status, background and reasons of the introduction, as well as typical defence-in-depth modes, of the first running Leittechnique system of this kind (in the Grafenrheinfeld nuclear power plant) and especially their different tasks in disturbance handling are described. The international situation and future developments are briefly characterized. (9 refs.)

117671 A CMOS-logic-based reactor instrumentation system. J.E.Carpenter (Fisher Controls Ltd., London, England), K.Lillie.
Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium, Munich, Germany, 11-15 Oct. 1982 (Vienna, Austria: IAEA 1983), p.321-37
The authors describe a control and instrumentation (C&I) system for nuclear reactors. In the equipment design, a standard 'building block' technique was adopted so that a wide range of measurements for reactor safety equipment

could be provided from standard plug-in cards and modules fitted in rugged purpose-designed racks. CMOS (complementary metal oxide semiconductor) digitally based equipment was selected for this application after extensive evaluation of other technologies. The racks contain all the electronics so that sensors are just passive components, i.e. there are no driver circuits in the containment area. A particular system is described which is arranged as four identical redundant subsystems and one set of on-line test equipment, but this is only one of many possible arrangements. (no refs.)

28.44 FISSION REACTOR PROTECTION SYSTEMS, SAFETY AND ACCIDENTS

117672 Canadian approach to nuclear power safety. R.J.Atchison, F.C.Boyd, Z.Domaratzki (AECB, Ottawa, Ontario, Canada).
Nucl. Saf. (USA), vol.24, no.4, p.439-58 (July-Aug. 1983).
The development of the Canadian nuclear power safety philosophy and practice is traced from its early roots at the Chalk River Nuclear Laboratories to the licensing of the current generation of power reactors. Basic to the philosophy is a recognition that the licensee is primarily responsible for achieving a high standard of safety. As a consequence, regulatory requirements have emphasized numerical safety goals and objectives and minimized specific design or operating rules. In this article the Canadian licensing process is described with a discussion of some of the difficulties encountered. Examples of specific licensing considerations for each phase of a project are included. (30 refs.)

117673 Bayesian estimation of core damage frequency incorporating historical data on precursor events. C.D.Heising (Dept. of Nuclear Engng., MIT, Cambridge, MA, USA), A.Mosleh.
Nucl. Saf. (USA), vol.24, no.4, p.485-93 (July-Aug. 1983).
Data from a recent report analyzing precursors to severe core damage accidents are presented as additional evidence combined with the results of engineering risk analyses through the use of Bayes' theorem. Calculations are performed based on various definitions of increasing core damage: mild to severe core damage (no melting of fuel), full-scale core melt, and worse-case accidents. The Reactor Safety Study alone and combined with other published probabilistic risk assessment study results is also used. Assuming various core damage levels exist, the result of the Bayesian calculations indicate that the evidence, including precursor events, may not alter significantly core damage frequency estimates. (9 refs.)

117674 EPRI research in qualification of safety-related electrical equipment. G.E.Sliter (EPRI, Palo Alto, CA, USA).
Nucl. Saf. (USA), vol.24, no.4, p.494-505 (July-Aug. 1983).
Environmental qualification of safety-related electrical equipment easily qualifies for the top-10 list of issues in nuclear power safety during the past decade. The author gives an overview of what qualification is and is not, why qualification requirements may have reached a point of diminishing return in terms of improved safety, and how the research sponsored by utilities through the Electric Power Research Institute (EPRI) is helping them to meet growing qualification requirements in a technologically consistent manner and at minimum cost. Results to date from five EPRI research efforts are summarized: a review of equipment-aging technology, a comptuterized equipment qualification databank, radiation effects on organic materials in plant equipment, shake-table tests to examine the need for ageing before seismic qualification, and hydrogen burn tests to determine the conditions under which qualified equipment can survive degraded-core accidents. (36 refs.)

117675 Optimization of the man-machine interface for LMFBRs. S.E.Seeman, R.W.Colley (Westinghouse Hanford Co., Richland, WA, USA), R.C.Stratton.
Nucl. Saf. (USA), vol.24, no.4, p.506-12 (July-Aug. 1983).
An effort is under way to optimize the roles of man and machine in control of liquid-metal-cooled fast breeder reactors. The work reported here describes two systems: (1) MIDAS, presently in use, is a large data base system developed for the Fast Flux Test Facility (FFTF) as an aid to operators in determining how to proceed with maintenance and repairs on plant components and (2) the Procedure Prompting System is being developed to demonstrate a new methodology for automatically generating instructions to aid plant recovery in off-normal conditions. Methodology for this system has been demonstrated on a model of a small subsystem of FFTF. (4 refs.)

117676 Pressure vessel thermal shock: experience at US pressurized-water reactors, 1963-1981. D.L.Phung (Inst. for Energy Analysis, Oak Ridge Associated Univ., Oak Ridge, TN, USA), W.B.Cottrell.
Nucl. Saf. (USA), vol.24, no.4, p.520-33 (July-Aug. 1983).
The authors summarize the results of a study whose purpose was to identify and analyze events at US pressurized-water reactors (PWRs) which either resulted in or could be considered as precursors to pressure vessel thermal shock (PVTS). The data base includes ~16000 Licensee Event Reports on 47 PWRs, covering ~329 reactor-years from 1963 through 1981. The 99 identified events were assigned to one of five categories of severity. On this basis, 34 of the events were considered significant to PVTS. The events are categorized by cause and by vendor of the plant at which the event occurred. Some probabilistic risk assessment data are also developed. (8 refs.)

117677 Salem breaker incident.
Nucl. Saf. (USA), vol.24, no.4, p.540-4 (July-Aug. 1983).
After the failure in the scram system at unit 1 of the Salem Nuclear Generating Station in February 1983, the Nuclear Regulatory Commission (NRC) established a task force to conduct a fact-finding investigation of the incident. They found that maintenance and testing procedures for the scram system were inadequate. NRC bulletins were issued to alert the industry and induce better maintanance and testing. (4 refs.)

117678 A finite element quasi-Eulerian method for three-dimensional fluid-structure interactions. R.K.Kulak (Reactor Analysis & Safety Div., Argonne Nat. Lab., Argonne, IL, USA).
Comput. & Struct. (GB), vol.18, no.2, p.319-32 (1984).
A quasi-Eulerian approach is used in the development of a three-dimensional hydrodynamic finite element. With this approach the motion in the computing grid may be different from the motion of the material. Within each element the field variables are represented by trilinear interpolation functions and the pressure field is assumed to be constant. This leads to a set of simple relations for internal nodal forces that are easily coded and computationally efficient. Because the formulation is based upon a rate approach it is applicable to problems involving large displacements. The technique of degeneration is applied to the hexahedron to generate a pentahedral element. The use of the hour-glass dissipating nodal-forces for mesh stabilization is discussed. The procedure used to couple the fluid and structural domains of a problem is presented. The above method is applied to a three-dimensional, fluid-structure interaction problem in the area of reactor safety. (24 refs.)

117679 Thermal shock—new nuclear-reactor safety hazard?. E.Edelson.
Electron. Aust. (Australia), vol.45, no.8, p.12-17 (Aug. 1983).
Coolant water from the accumulator flooding into older reactor vessels during an emergency may create abrupt temperature and pressure changes, cracking steel walls or weld joints weakened by prolonged exposure to neutrons. In this pressurized-water reactor, water is pumped through the core and transfers heat to a steam generator. The full facts on this possible safety hazard are given. (no refs.)

117680 Analytic redundancy for online fault diagnosis in a nuclear reactor. A.Ray, R.Geiger, M.Desai, J.Deyst (Charles Stark Draper Lab. Inc., Cambridge, MA, USA).
J. Energy (USA), vol.7, no.4, p.367-73 (July-Aug. 1983).
A computer-aided diagnostic technique has been applied to online signal validation in an operating nuclear reactor. To avoid installation of additional redundant sensors for the sole purpose of fault isolation, a real-time model of nuclear instrumentation and the thermal-hydraulic process in the primary coolant loop was developed and experimentally validated. The model provides analytically redundant information sufficient for isolation of failed sensors as well as for detection of abnormal plant operation and component malfunctioning. (10 refs.)

117681 Risk assessment in reactors. N.Saqib (Karachi Nuclear Power Plant, Karachi, Pakistan).
Nucleus (Pakistan), vol.20, no.1, p.19-21 (Jan.-March 1983). [received: Oct. 1983]
The Maximum Credible Accident approach used for reactor safety assessment in the past has proved inadequate and a Probabilistic Approach has now caught the fancy of the scientific world. This paper introduces the newer approach. (4 refs.)

117682 LOCA hydroloads calculations with multidimensional nonlinear fluid/structure interaction. Vol.IV. Fluid/structure interaction application studies. F.H.Chang, G.A.Mortensen, G.E.Santee,Jr., G.F.Brockett, M.Gross, T.Belytschko.
Report EPRI-NP-1401, Electr. Power Res. Inst., Palo Alto, CA, USA (May 1983), 72 pp.
Available from Research Report Center, Box 50490, Palo Alto, CA, USA.
The authors describe the application of a three-dimensional nonlinear fluid-structure interaction methodology to the calculation of the structural response of pressure vessel internals during a postulated loss-of-coolant accident. Results of the PWR/HDR calculation are compared with the HDR V31.1 test results, and the transient response of the fuel bundle is presented.

117683 Spray removal of fission products in PWR containments. D.R.Grist.
Report SRD R 267, UKAEA, Culcheth, Lancs., England (Nov. 1982), 61 pp.
Containment spray systems are provided in PWR containments to condense steam and to remove fission products from the containment atmosphere under accident conditions. This report provides models and parameters for assessing the rate and extent of removal of various fission product species. A range of droplet sizes and of spray additive options is considered and removal of vapour phase inorganic iodine species, of organic iodides and of aerosols containing fission products is discussed. Aerosol removal is assessed in terms of contributing removal mechanisms and the removal rate modelled as a function of the radius of the aerosol particulate species. (11 refs.)

117684 Safety system backfitting. G.B.Karlsson (Asea-Atom AB, Vasteras, Sweden).
Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium, Munich, Germany, 11-15 Oct. 1982 (Vienna, Austria: IAEA 1983), p.57-67
In recent years, the necessity of physical separation of equipment to achieve redundancy and fire protection of a passive character has been emphasized. In order to improve the passive fire protection in the first Swedish commercial nuclear power plant, Oskarshamn-1, a project for cable separation and safety system upgrading has been executed. Oskarshamn-1 is an 'old' plant and therefore a number of backfitting projects have been considered; the author deals with one of the largest and most important backfitting projects and describes the basic technical principles applied in the design phase and the feedback achieved as a result of the project. (no refs.)

117685 Improvements in the control and monitoring of PWR pressure vessels in post-accident situations. B.Appell, R.Marcille, B.Perrin (Electricite de France, Paris, France).
Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium, Munich, Germany, 11-15 Oct. 1982 (Vienna, Austria: IAEA 1983), p.69-78 In French.
Post-accident instructions based on initial events do not cover multiple equipment or human failures. Only instructions which are based on the status of physical parameters and changes occurring in them can cover the entire range of possibilities. A study of new instructions of this type has led to: (1) the design of a logic diagram for continuous monitoring for each state; this logic diagram is applied by the safety engineer, independently of the instructions for each event followed by the operators; the safety engineer may insist on the application of emergency instructions if certain specifications are exceeded; and (2) the inclusion in the event instructions of elements of the approach, whereby control procedures are determined by the plant state. In anticipation of the final results of the study, both the content (realistic post-accident developments have been taken into account) and the form (following a study of operator behaviour on simulators) of event instructions have been improved. Three computer-operated communication and information stations constitute the 'safety panel'. They present concise and detailed information to assist operators, the safety engineer and the team of emergency control experts whom the plant director can assemble if required. (no refs.)

117686 A plant protection interlock system for the United Kingdom Prototype Fast Reactor. D.Hodgson, N.T.C.McAffer (Systems Engng. Design Office, UKAEA, Risley, England), M.A.Read.
Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium, Munich, Germany, 11-15 Oct. 1982 (Vienna, Austria: IAEA 1983), p.79-89
The development of operating procedures for the prototype fast reactor and general plant commissioning has shown that some of the original systems lacked flexibility and changes are now considered desirable to meet the current-needs. The authors describe recent work carried out to improve and extend the protection system associated with the secondary sodium circuits and steam generators, by the provision of a completely new programmable system sited in the central control room area. Connection to the plant continues to use the original cables and cubicles as marshalling frames for all input and output signals. The new control logic is based on programmable logic controllers operating in a majority-vote mode with final plant drive signals being provided by electromagnetic relays. Programming is carried out with the aid of a microprocessor development system away from the plant, and all the programs and modifications are stored on floppy discs. (no refs.)

117687 Design and implementation of a computerized system for evaluation of plant status with respect to safety technical regulations. F.Dworzak, A.Nedelik (Osterreichisches Forschungszentrum Seibersdorf GmbH, Seibersdorf, Austria), P.A.Van Gemst.
Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium, Munich, Germany, 11-15 Oct. 1982 (Vienna, Austria: IAEA 1983), p.151-8
The authors describe the development, implementation and evaluation of the pilot version of a computerized system which supervises the operability of plant safety systems during normal plant operation. The system has been designed for use by the reactor operating staff and supplies the operator with comprehensive information on both the present situation and the operability of systems by performing a fast evaluation of the plant status. The system also indicates operational restrictions when any of the reactor safety systems are of restricted availability. Additionally, the system can be used for planning maintenance work and test activities as well as for training. Safety technical regulations are discussed and the principles of safety philosophies are briefly explained. The efforts with regard to the pilot project, which was implemented in the Forsmark-1 nuclear power plant in Sweden, are summarized. The results of this experiment are evaluated and recommendations for further improvements and future development work for full-scale application are outlined. (5 refs.)

117688 Post-accident diagnosis system. P.A.Van Gemst (ASEA-ATOM AB, Vasteras, Sweden), P.-O.G.Waessman.
Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium, Munich, Germany, 11-15 Oct. 1982 (Vienna, Austria: IAEA 1983), p.159-71
The Swedish State Power Board will integrate a post-accident diagnosis system (PADS) of ASEA-ATOM design in the control rooms of its nuclear power plants Ringhals 1 and Forsmark 1 and 2. The authors describe the background for this decision, important design criteria and system design, and gives some examples of the proposed picture display. (no refs.)

117689 Diagnostic system for nuclear power plant operation. J.Wakabayashi, S.Tashima, A.Gofuku (Inst. of Atomic Energy, Kyoto Univ., Kyoto, Japan).
Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium, Munich, Germany, 11-15 Oct. 1982 (Vienna, Austria: IAEA 1983), p.187-201
A diagnostic system for nuclear power plant operation was proposed and the applicability of this system to the actual plant verified by computer simulation. The diagnostic system is composed of three phases. In phase 1, a set of observed signals (observed vector) obtained from a plant is identified with one of the patterns (categories) representing normal operation and a number of anticipated anomalous situations; if there is no probable category, the observed vector is identified as an unanticipated anomalous state. If it is assumed that multiplex anomalies appear sequentially with some time interval, these anomalies are also identified in phase 1. When the observed vector is identified in phase 1 with one of the anticipated single or multiplex anomalous situations, the magnitude and time transition of the anomaly source is estimated in phase 2 on the basis of previous signals obtained from phase 3 (storage) and incoming signals. A χ^2-test and calculation of the normal probability density functions are carried out in phase 1, and the Kalman filtering technique is applied in phase 2. (6 refs.)

117690 Information provided to the operator via visual display screens: optimization of alarm signals. A.Seisdedos (Empresarios Agrupados, SAE, Madrid, Spain).
Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium, Munich, Germany, 11-15 Oct. 1982 (Vienna, Austria: IAEA 1983), p.285-95 In Spanish.
Present-day computers can be used for a range of applications, one of which is the alarm system for a power plant. Generally speaking, the number of alarms generated is excessive in relation to the amount of data that the operator can handle. Furthermore, the display screens become overloaded with signals, as a result of which they become less effective and the operator loses track of the real status of the plant. It is, therefore, necessary to optimize the number of alarms and display screens in the system. One way is to establish degrees of priority for the alarms in order to exclude from the display from the display any signals which do not call for immediate action by the operator, although a case-by-case study cannot be entirely avoided. It is also desirable to program on the same computer a large package of graphic signals providing a complete overview of the plant. Alongside the above system, an optimised conventional alarm system, providing redundancy and support, is expedient. (no refs.)

117691 Computers in CANDU special safety systems. N.M.Ichiyen (Eng. Co., Sheridan Park Res. Community, AECL, Mississauga, Ontario, Canada).
Nuclear Power Plant Control and Instrumentation 1982. Proceedings of an International Symposium, Munich, Germany, 11-15 Oct. 1982 (Vienna, Austria: IAEA 1983), p.339-53
Computers hve been used in CANDU reactors for both direct digital control and control-room functions such as alarm annunciation, presentation of operating data, and data logging. However, until recently, computers were not used in the special safety systems. Recent designs have proposed computerization in all the safety systems, but implementation is most advanced in the two shut-down systems. The evolution of computers in safety systems has been in three stages: first, the monitoring of important shut-down system variables; secondly as programmable digital comparators which implement selected shut-down system functions; and thirdly the fully computerised shut-down system design being implemented in the Darlington A generating Station. 28.52 FUSION REACTORS

(for confinement, see 52.55)

117692 Prospects for fusion by 1995.
Fusion (USA), vol.5, no.3, p.9-16 (Sept. 1982). [received: Sept. 1983]
A review of current fusion programs is presented along with an assessment of the economic viability of polarised and unpolarised D-T reactors. (1 ref.)

117693 Technological methods in polarized fusion.
Fusion (USA), vol.5, no.3, p.17-22 (Sept. 1982). [received: Sept. 1983]
Technological methods for polarised fusion reactors are discussed, including pulsed operation and use of tandem mirrors. (2 refs.)

117694 Scientific frontiers in polarized fusion.
Fusion (USA), vol.5, no.3, p.24-7 (Sept. 1982). [received: Sept. 1983]
The problems of nuclear fusion are discussed, in particular the use of polarisation to control fusion. (1 ref.)

117695 A pellet model of DT ignitor and DD fuel for an ICF reactor without tritium breeding blanket. S.Ido (Inst. of Laser Engng., Osaka Univ., Osaka, Japan), T.Tazima.
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.7, p.1194-9 (July 1983).
A pellet concept of a DT ignitor and DD fuel for an ICF reactor without a tritium breeding blanket is analytically examined under the condition that T is bred through the DD reactions. There is the additional restriction that the tritium breeding ratio in a pellet is unity, including the in situ DT burn in the DD region. Model calculations show that sufficiently high pellet gain can be obtained in a DT-DD pellet, when fuel ρR increases to ~ 40 g/cm^2 and the fraction of energy released in the DD region becomes dominant. One-dimensional neutronics calculations carried out for a reference pellet model with $\rho R \sim 40$ g/cm^2 show that the neutron heating in the compressed pellet model is evident and the total energy of the neutrons escaping from the pellet is reduced from ~ 2000 MJ to 330 MJ for a microexplosion of ~ 3000 MJ. (18 refs.)

117696 Preheating energy in a soft-X-ray-accelerated foil. H.Shiraga, S.Sakabe, K.Okada, T.Mochizuki, C.Yamanaka (Inst. of Laser Engng., Osaka Univ., Osaka, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L383-5 (July 1983).
Preheated temperature in a soft X-ray driven ablation was found by a double foil experiment to be $T_{ph}=2\sim 12$ eV for a 1.7 μm thick Al target at the incident X-ray irradiance of $I_x=10^{13}$ W/cm^2. This preheating was caused by the higher $h\nu$ component (~ 1 keV) of the soft X-ray spectrum. Its energy flux was also estimated to be $27\sim 260$ J/cm^2. (10 refs.)

117697 ECR-discharge cleaning for liner-containing Tokamaks. S.Ishii, K.Okazaki, Y.Sakamoto, K.Yano (Inst. of Phys. & Chem. Res., Saitama, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L403-5 (July 1983).
An experiment on electron-cyclotron-resonance (ECR) discharge cleaning was conducted in the TEXTOR device. A clean-up time for the liner was determined by estimating a total atomic flux integrated over spatial distributions of the ECR plasmas. It was proved that the vacuum components between the liner and vacuum vessel of tokamaks can be cleaned by this method. (8 refs.)

117698 Time decay of electric fields probed by charged reaction products in six-beam symmetrical implosion experiments. J.Delettrez, A.Entenberg, Y.Gazit, D.Shvarts, J.Virmont, T.Bristow, J.M.Soures, A.Bennish (Lab. for Laser Energetics, Univ. of Rochester, Rochester, NY, USA).
Nucl. Fusion (Austria), vol.23, no.9, p.1135-41 (Sept. 1983).
Alpha-particle spectra have been measured with a time-of-flight detector in laser fusion experiments on the symmetrical illumination, six-beam ZETA laser system (Nd-doped phosphate glass, $\lambda=1.054$ μm). For a series of fast imploding targets, upward mean energy shifts of alpha particles were observed. These energy shifts were attributed to a time-varying electric field which charged reaction products experience as they pass through the corona of the imploding microballoon. A one-dimensional, two-temperature hydrodynamics code was used to simulate both the expanding corona and the imploding glass. The corona simulation gave rise to an electric field with a decay time of the order of the laser pulse width. The acceleration of alpha particles by this field satisfactorily accounted for their observed alpha-energy shifts. (15 refs.)

117699 A capillary discharge thermonuclear burner. R.A.McCorkle (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
Nuovo Cimento B (Italy), vol.77B, ser.2, no.1, p.31-41 (11 Sept. 1983).
Transient behavior of high-power discharges in small-diameter capillaries is a means for obtaining thermonuclear burn. (26 refs.)

28.80 RADIATION TECHNOLOGY, INCLUDING SHIELDING

(see also 87.60 Medical and biomedical uses of fields, radiations and radioactivity)

117700 The recovery of organic solvents from liquid scintillation waste. J.A.Mangravite, D.Gallis, R.Foery (West Chester State Coll., West Chester, PA, USA).
Am. Lab. (USA), vol.15, no.7, p.24-34 (July 1983).
The authors have demonstrated the feasibility of separating the organic solvents xylene and toluene from liquid scintillation wastes. The solvents are removed completely from the waste material by distillation, leaving behind most of the radioactive contaminants. While a small amount of radioactivity is seen in the distillate, the source of this contamination is either the cosolvent, 2-ethoxyethanol, or water. These materials can be completely removed from the xylene or toluene distillates by treatment with anhydrous $CaCl_2$. (8 refs.)

117701 Angular flux of 662 keV gamma-ray transport in water. J.Banai (Dept. of Mech. Engng., Liverpool Univ., Liverpool, England).
Atomkernenerg. Kerntech. (Germany), vol.42, no.3, p.181-5 (1983).
Establishing experimental angular benchmark data from a point isotropic Cs 137 source in an effectively semi-infinite medium of water, slight discontinuities of the differential energy and angle spectra were observed at the single-scattering cut-off-energy. These spectra were compared with values calculated using the code PIPE (Program Integrating Photon transport Equation) and earlier benchmarks. Exposure buildup factors were computed from the angular fluxes for a range of angles between 5 and 70 degrees for separations of 15, 30, 45, 60 and 75 cm between source and water surface. Furthermore, the energy range of scattered photons from a point source is derived from the Compton relation. (20 refs.)

117702 Az egesztestszamlalo scannelo meroelrendezesenek kalibracioja (Whole body counter scanning system calibration). A.Andrasi, E.Beleznay.
Report KFKI-1983-43, Hungarian Acad. Sci., Budapest (1983), 29 pp.
The calibration of the mechanically and electronically improved whole body counter has been performed. In scanning and scanning-end-stop methods the validity of the calibration data obtained for the former system was checked and found to be applicable also to the improved new system. For double detector profile, and rectilinear scanning systems, the influence of the point source location inside the phantom and of the source gamma energy on the linear spatial resolution and on the counting efficiency were investigated in the case of different collimators. It was found that more uniform vertical response can be obtained when the arithmetic or geometric mean of the double detector responses was taken into account for integrated total spectra or for full energy peaks respectively. In the given geometry and for gamma energy of 662 keV the point source efficiency varies in the range of 0.4-1.9 cps/γ Bq, while the spatial resolution changes from 4 to 25 cm depending on the type of collimator used. (3 refs.)

117703 Investigation of fission models for high-energy radiation transport calculations. T.W.Armstrong, P.Cloth, D.Filges, R.D.Neef.
Report JUL-1859, Kernforschungsanlage, Julich, Germany (July 1983), 71 pp.
An investigation of high-energy fission models for use in the HETC code has been made. The validation work has been directed checking the accuracy of the high-energy radiation transport computer code HETC to investigate the appropriate model for routine calculations, particularly for spallation neutron source applications. Model calculations are given in terms of neutron production, fission fragment energy release, and residual nuclei production for high-energy protons incident on thin uranium targets. The effect of the fission models on neutron production from thick uranium targets is also shown. (29 refs.)

117704 Method of risk assessment for a multi-plant site. R.F.White.
Report SRD R 273, UKAEA, Culcheth, Lancs., England (June 1983), 69 pp.
A model is presented which can be used in conjunction with probabilistic risk assessment to estimate whether a site on which there are several plants (reactors or chemical plants containing radioactive materials) meets whatever risk acceptance criteria or numerical risk guidelines are applied at the time of the assessment in relation to various groups of people and for various sources of risk. The application of the multi-plant site model to the direct and inverse methods of risk assessment is described. A method is proposed by which the

potential hazard rating associated with a given plant can be quantified so that an appropriate allocation can be made when assessing the risks associated with each of the plants on a site. (7 refs.)

117705 Theoretical concept for measuring doses from external radiation in radiation protection - A supplement. B.R.L.Siebert, R.Hollnagel, R.Jahr.
Report PTB-ND-21, Phys.-Tech. Bundesanstalt, Braunschweig, Germany (June 1983), 36 pp.
A previously published theoretical concept for measuring individual doses from external radiation in radiation protection is applied to the following topics: film dosemeters in photon dosimetry, finite distances between the radiation sources and the exposed individual, calibration procedures for individual dosemeters in practical situations in which the dosemeter can be calibrated for only a finite set of energy spectra and directions of incident radiations. 28.90 OTHER TOPICS IN NUCLEAR ENGINEERING AND NUCLEAR POWER STUDIES

117706 Dekontamination von Komponenten stillgelegter Kernkraftwerke fur die freie Beseitigung (Decontamination of components of closed-down nuclear power stations for open air disposal). G.Lorcher, W.Piel.
Report EUR 8704 DE, Comm. European Communities, Luxembourg (1983), v+116 pp. In German. Contract DE-B-009-D.
An important task during the decommissioning of nuclear power plant is the decontamination of contaminated matter to an extremely low residual level. This kind of treatment allows disposal at municipal refuse tips or recycling and, consequently, reduces the quantity of radioactive waste to be disposed of. In order to evaluate the economic aspects of such a decontamination procedure, an estimation of costs for final disposal is needed. Such a comparison between final disposal and decontamination treatment is possible only under the condition that for the two procedures examined all cost elements, such as cutting to reduce size, conditioning, packaging and transport, are taken into account. (31 refs.)

29.00 EXPERIMENTAL METHODS AND INSTRUMENTATION FOR ELEMENTARY-PARTICLE AND NUCLEAR PHYSICS

29.15 ELECTROSTATIC AND LINEAR PARTICLE ACCELERATORS

117707 LAMPF II. C.M.Hoffman (Los Alamos Nat. Lab., Los Alamos, NM, USA).
AIP Conf. Proc. (USA), no.102, p.3-8 (1983). (Theoretical Symposium on Intense Medium Energy Sources of Strangeness, Santa Cruz, CA, USA, 18-21 March 1983).
A brief description of LAMPF II is presented. LAMPF II is a planned high intensity 16-32 GeV proton accelerator with LAMPF as the injector. Some of the physics which could be studied with LAMPF II is discussed. (7 refs.)

117708 The electron linear accelerator, a versatile source of radiation. U.Kneissl (Justus-Liebig-Univ., Giessen, Germany).
Atomkernenerg. Kerntech. (Germany), vol.42, no.3, p.151-6 (1983).
The different kinds of radiation (electrons, positrons, photons, neutrons) available at conventional electron linear accelerators and their performances are described. The capabilities of the new high duty-cycle facilities are discussed. (29 refs.)

117709 A pulsed electron accelerator with extraction of a broad beam into the atmosphere. M.A.Abroyan, P.M.Bogomazov, S.F.Zverev, S.L.Kosogorov, V.A.Lagutin, V.A.Rodichkin, A.D.Susarov, G.M.Tokarev, K.A.Sharkov (Electrophys. Apparatus Res. Inst., USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.5, pt.1, p.1065-7 (Sept.-Oct. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR),* vol.25, no.5, p.28-30 (Sept.-Oct. 1982). [received: Sept. 1983]
Design features and test results are presented for a pulsed electron accelerator producing a beam of cross section 20×80 cm^2 in the atmosphere. With an accelerating voltage of 240 kV and a pulse length of 40 μsec, the density of the beam current extracted into the atmosphere is 8 mA/cm^2 with an inhomogeneity in the current density distribution of $\leq 10\%$ over an area of 0.9 of the nominal area of the beam. (6 refs.)

117710 Measurement of the number of electrons in electron rings from infrared synchrotron radiation. Yu.M.Volkov, A.A.Mal'tsev, V.A.Sviridov, V.P.Fominenko, V.P.Chizhov (Joint Inst. for Nuclear Res., Dubna, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.5, pt.1, p.1080-3 (Sept.-Oct. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR),* vol.25, no.5, p.40-3 (Sept.-Oct. 1982). [received: Sept. 1983]
A method has been developed for measuring the number of electrons in electron rings used in the collective acceleration of ions. The measurement is made from the synchrotron radiation in the infrared region. The detector used for the synchrotron radiation was an integrated-circuit silicon photodetector and amplifier, built into a single housing. The photodetector was calibrated with a heat source, viz. an SIRSh 6-100 light-measuring lamp with a ribbon-shaped tungsten luminous element. The measuring method has been checked on the synchrotron at the Leningrad Institute of Nuclear Physics. (4 refs.)

117711 Investigation of the operation of a two-stage accelerator with an anode layer with one electrical power supply. A.F.Kovrizhko, I.N.Safronov, A.V.Semenkin.
J. Appl. Mech. & Tech. Phys. (USA), vol.23, no.6, p.776-8 (Nov.-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR),* vol.23, no.6, p.48-51 (Nov.-Dec. 1982). [received: Sept. 1983]
The two-stage accelerator with an anode layer, which has high acceleration efficiency, has a fairly complex electrical supply system, consisting of two independent power supplies. This complex power supply limits the range of application of these accelerators. The authors describe the results of an investigation of the operation of a two-stage accelerator with an anode layer with a simplified electrical power supply containing one source and an RC-divider. 29.20 CYCLIC ACCELERATORS AND STORAGE FACILITIES

(for plasma accelerators, see 52.75)

117712 The TRIUMF kaon factory. D.Bryman (TRIUMF, Vancouver, BC, Canada).
AIP Conf. Proc. (USA), no.102, p.9-14 (1983). (Theoretical Symposium on Intense Medium Energy Sources of Strangeness, Santa Cruz, CA, USA, 18-21 March 1983).
A kaon factory, using TRIUMF as an injector, could provide beams of kaons, neutrinos and other particles 100 to 1000 times more intense that are available at existing machines in the 30 GeV range. Consequently experimental opportunities would arise for new studies involving CP violation, rare kaon decays and fundamental neutrino interactions. (25 refs.)

117713 The BNL AGS—a context for kaon factories. L.S.Littenberg (Brookhaven Nat. Lab., Upton, NY, USA).
AIP Conf. Proc. (USA), no.102, p.15-42 (1983). (Theoretical Symposium on Intense Medium Energy Sources of Strangeness, Santa Cruz, CA, USA, 18-21 March 1983).
The author discusses the use of the BNL-AGS as a kaon factory and the possible areas of experimental use. (20 refs.)

117714 The SuSe project—a heavy ion accelerator for intermediate energies. G.Hinderer, P.Kienle, W.Schott, U.Trinks, W.Wilhelm, E.Zech (Tech. Univ. Munchen, Garching, Germany).
Atomkernenerg. Kerntech. (Germany), vol.42, no.3, p.145-9 (1983). In German.
A project to open up the field of heavy-ion physics in the medium energy range using advanced methods is described. Various fields of physics which become accessible with medium energy beams of particles exceeding the pion production threshold are reviewed. The concept is derived from the requirement of high beam quality, i.e. small energy spread, short time structure and good emittances. The beam is carefully treated from the ion source to the experimental equipment in order to minimize possible deteriorations of its quality. An injector like the Munich 13-MV tanden accelerator followed by a superconducting sector cyclotron (SuSe) is an excellent combination to achieve this purpose for light and medium-heavy ions. (6 refs.)

117715 A precision current stabilizer for the main winding of a cyclotron for use in a multicoupled control system. V.I.Sakhno, P.P.Teplov, V.G.Tsyvinskii (Kiev Polytech. Inst., Kiev, Ukrainian SSR).
Instrum. & Exp. Tech. (USA), vol.25, no.5, pt.1, p.1067-9 (Sept.-Oct. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR),* vol.25, no.5, p.30-2 (Sept.-Oct. 1982). [received: Sept. 1983]
Details are considered of an automatic control system for the current in a multiwound cyclotron magnet. The current stabilizer for the main winding of a 240-cm isochronous cyclotron is used to show that the incorporation of an additional resistance-actuated control circuity provides the required stabilization accuracy, with scope for computer control. (4 refs.)

117716 Measurement of parameters of electron-ion storage rings. V.D.Inkin, A.A.Mozelev, V.P.Sarantsev (Joint Inst. for Nuclear Res., Dubna, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.5, pt.1, p.1074-80 (Sept.-Oct. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR),* vol.25, no.5, p.36-40 (Sept.-Oct. 1982). [received: Sept. 1983]
A system is described for mesuring the number of electrons and ions in a collective heavy-ion accelerator. The operating principle of the system is that of detecting bremsstrahlung γ rays produced during the interaction of electrons from the storage ring with the nuclei of neutral atoms and ions at different stages of filling of the ring with ions. (8 refs.)

Accelerator production of medically useful radionuclides .... See Entry 121007

29.25 PARTICLE SOURCES AND TARGETS, PREPARATION AND TECHNOLOGY

(see also 07.77 Particle production and handling; targets)

117717 Transport of the beam phase space with non-centrosymmetric configuration. Chen Yinbao, Xie Xi (Inst. of Atomic Energy, Acad. Sinica, Beijing, China).
Chin. J. Nucl. Phys. (USA), vol.5, no.3, p.279-86 (Aug. 1983). In Chinese.
A transport theory of the non-centrosymmetric beam phase space has been developed. The beam envelope of the non-centrosymmetric polygonal and convex close curve phase space is proved to be the same as the beam envelope of the equivalent centrosymmetric phase space defined by the given non-centrosymmetric phase space and its image phase space with respect to the

origin of the coordinates as well as their common external tangents taken together. Thus the beam envelope of the non-centrosymmetric polygonal and convex close curve phase space is determined uniquely by the vertices and the parts of curve at the periphery of the so-defined equivalent centrosymmetric phase space, independently of those vertices and parts of curve within it. (1 ref.)

117718 Assay of radionuclide sources by energetic ion beams. I.V.Mitchell, D.Reher (Commission of the European Communities, Central Bur. for Nuclear Measurements, Geel, Belgium).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1277-90 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
The nondestructive analytical techniques of Rutherford backscattering and particle-induced X-ray emission spectrometry are described. Their application to the characterisation of thin radioactive deposits, prepared by different techniques, is illustrated by reference to recent examples carried out at the CBNM. (18 refs.)

117719 A magnetic-induction beam current transducer with shielding from magnetic interference. A.S.Kalinin, E.I.Shubin (Nuclear Phys. Inst., Acad. of Sci., Novosibirsk, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.5, pt.1, p.1070-4 (Sept.-Oct. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.5, p.32-5 (Sept.-Oct. 1982). [received: Sept. 1983]
A description is given of a magnetic-induction transducer for the beam current monitoring in a synchrotron acting as a booster for the VEPP-4 electron-positron system. The transducer operates with strong interference from the pulsed magnetic field in the synchrotron. Ways of reducing the interference level are considered. These measures enable one to monitor small beam currents (about 100 μA). (6 refs.)

117720 PHOBIS, a photon beam ion source for production of highly-charged ions. K.W.Jones, B.M.Johnson, M.Meron (Brookhaven Nat. Lab., Upton, NY, USA).
Phys. Lett. A (Netherlands), vol.97A, no.9, p.377-80 (26 Sept. 1983).
An ion source based on successive photoionization of trapped ions is now possible using high-brightness X-rays from a modern synchrotron storage ring. Calculations based on the design parameters for the National Synchrotron Light Source at Brookhaven indicate that degrees of ionization and beam intensities should be comparable to those achieved with existing EBIS, ECRIS, or recoil-ion sources. (9 refs.)

117721 Calculation of phase space compression by friction plus *RF* acceleration for charged particles. H.Daniel (Dept. of Phys., Tech. Univ. Munchen, Garching, Germany).
Z. Phys. A (Germany), vol.313, no.3, p.249-50 (1983).
Frictional phase space compression for charged particles is treated in closed form. The basic idea is to accumulate the particles in a 'synchrotron' with the frictional energy loss compensated on the average by RF acceleration and thus reduce the transverse phase space. (11 refs.)

117722 Muon flux measurement with silicon detectors in the CERN neutrino beams. E.H.M.Heijne.
Report CERN 83-06, CERN, Geneva, Switzerland (21 July 1983), viii+261 pp.
The neutrino beam installations at the CERN SPS accelerator are described, with emphasis on the beam monitoring systems. Especially the muon flux measurement system is considered in detail, and the calibration procedure and systematic aspects of the measurements are discussed. An introduction is given to the use of silicon semiconductor detectors and their related electronics. Other special chapters concern nonlinear phenomena in the silicon detectors, radiation damage in silicon detectors, energy loss and energy deposition in silicon and a review of energy loss phenomena for high energy muons in matter. 29.30 RADIATION SPECTROMETERS AND SPECTROSCOPIC TECHNIQUES

117723 A rapid spectroscopic technique for determining the potential α-energy concentration of radon decay products. K.L.Revzan, W.W.Nazaroff (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).
Health Phys. (GB), vol.45, no.2, p.509-23 (Aug. 1983).
The application of α-spectroscopy to the rapid determination of the potential α-energy concentration (PAEC) of radon decay products indoors is considered. Two count totals are obtained after a single counting period. The PAEC is then estimated by a linear combination of the count totals, the two coefficients being determined by analysis of the dependence of the statistical and procedural errors on the equilibrium conditions and the sampling, delay and counting times. For a total measurement time of 11 min, the procedural error is unlikely to exceed 20% for equilibrium conditions commonly found indoors; the statistical error is less than 20% at a PaEC of 0.005 WL, assuming a product of detector efficiency and flow rate of at least 1.0l/min. (11 refs.)

117724 A versatile solid-state-detector spectrometer. D.Reher, W.Bambynek (Commission of the European Communities, Central Bur. for Nuclear Measurements, Geel, Belgium).
Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1301-9 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).
The Low Energy X-ray and Electron Spectrometer (LEXES) has been designed for the simultaneous measurement of photons and electrons with windowless solid-state detectors. Within this spectrometer two detectors can be moved independently of each other with respect to the source plane. The source is introduced through an interlock system in order to keep the detectors constantly cooled and under high vacuum. Special techniques and materials have been chosen to reach the low operating temperatures of the detectors and to keep the consumption of liquid nitrogen at an acceptable level. LEXES has been used for the measurement of various parameters, and recently for the determination of conversion-electron ratios in the decay of ^{93m}Nb (Reher, 1982). As a further example of such measurements the redetermination of the relative K-capture probability P_K in the decay of ^{139}Ce is described. A value of $P_K=0.75\pm0.05$ has been found which is in good agreement with recent measurements (Hansen and Mouchel, 1975; Plch et al. 1975). (28 refs.)

29.40 RADIATION DETECTORS

(for mass spectrometers, see 07.75)

117725 A comprehensive study of the yield of Cerenkov radiation in transparent media. F.M.Swailem, M.B.Moussa (Middle Eastern Regional Radioisotope Centre for the Arab Countries, Cairo, Egypt).
Atomkernenerg. Kerntech. (Germany), vol.42, no.3, p.177-80 (1983).
A comprehensive study on the theoretical and experimental yields (counting efficiencies) of Cerenkov radiation is made using different radioisotope solutions and different transparent refractive media. The used radioisotope solutions are ^{32}P, ^{89}Sr, ^{99}Tc, ^{65}Zn, ^{54}Mn ^{131}I, ^{51}Cr, ^{137}Cs and ^{134}Cs and the used transparent media are distilled water, KBr solution, NaCl solution and glycerol. An automatic liquid scintillation spectrometer fitted with two bialkaline phototubes in fast coincidence circuit is used for counting Cerenkov radiations. A computer program is written to compute the theoretical yield of the radiations. The comparison between theoretical and experimental yields shows a largely satisfactory agreement. (8 refs.)

117726 Radon measurement intercomparisons. I.M.Fisenne, A.George, M.McGahan (Environmental Measurements Lab., US Dept. of Energy, New York, NY, USA).
Health Phys. (GB), vol.45, no.2, p.533-6 (Aug. 1983).
A description is given of the Evironmental Measurements Laboratory (EML) radon calibration chamber used for intercomparison of the methods for measurement of radon and radon daughters. Results are presented of the April and June 1981 radon intercomparisons. The participitating facilities, their sampler type and the detection system used are tabulated. The intercomparison results indicate reasonable agreement among the participating facilities at elevated radon concentrations;. (2 refs.)

117727 The intercalibration of a radon daughter detection system with a radon detection system. J.P.McLaughlin (Dept. of Phys., Univ. Coll. of Dublin, Dublin, Ireland), N.Jonassen.
Health Phys. (GB), vol.45, no.2, p.556-9 (Aug. 1983).
The need for intercalibrations to be made between radon and radon daughter detection systems is discussed. This is necessary if a fuller understanding of the mechanisms of partitioning of radon daughters in the indoor environment between the free, attached and plateout states is to be obtained. A method which was developed for making an intercalibration of this type is presented. It is a method which is easy to use and to adapt for use by other investigators for the intercalibration of their radon and radon daughter detection systems. (9 refs.)

117728 Operation of multigap projection-type spark chambers. B.M.Golovin, Yu.A.Gornushkin, V.S.Nadezhdin, N.I.Petrov (Joint Inst. for Nuclear Res., Dubna, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.5, pt.1, p.1088-95 (Sept.-Oct. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.5, p.47-52 (Sept.-Oct. 1982). [received: Sept. 1983]
The article describes the design of a multigap projection-type spark chamber. The dependence of the track structure upon both the amplitude and the direction of the cleaning field was established. The possibility of determining angles in space, which characterize the direction of a trajectory, from a single projection of a track was investigated. It was shown that it is possible to operate the multigap projection-type spark chamber with an internal target. The possibility of using multigap projection-type chambers for ionization measurements was studied. (16 refs.)

117729 A drift chamber for the identification of slow particles. Yu.Zlomanchuk, A.Navrot, V.A.Nikitin, V.D.Peshekhonov, M.Shavlovski (Joint Inst. for Nuclear Res., Dubna, USSR).
Instrum. & Exp. Tech. (USA), vol.25, no.5, pt.1, p.1095-101 (Sept.-Oct. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.5, p.53-8 (Sept.-Oct. 1982). [received: Sept. 1983]
The resolving power with respect to mass and charge was calculated for a drift chamber as a function of both number and thickness of the measuring channels for ^{4}He, ^{24}Mg, and ^{56}Fe ions with energies of up to 10 MeV/nucleon.The calculations show that the chamber allows reliable identification of the elements in the range $Z=1$-30. The isotope resolution, which is excellent for He and Mg ions, is noticeably worse for iron. (12 refs.)

117730 Calculation of the spatial resolution of scintillation hodosocopes built on the basis of hodoscope photomultipliers at various types of time matching. V.G.Vasil'chenko, V.G.Lapshin, E.A.Monich, A.I.Ronzhin, V.I.Rykalin.
Instrum. & Exp. Tech. (USA), vol.25, no.5, pt.1, p.1102-7 (Sept.-Oct. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.5, p.58-62 (Sept.-Oct. 1982). [received: Sept. 1983]
The Monte Carlo method was used to calculate the spatial distribution of scintillation hodoscopes built on the basis of photomultipliers at various types of time matching. The calculations have shown that in order to obtain the best spatial resolution of the scintillation hodoscopes, one must either extend the duration of a single-electron photomultiplier pulse to the optimum value $t_e\geq30$ nsec when threshold techniques of time matching and the method of a constant fraction are used or provide for matching to the center of gravity of the photomultiplier pulse. (13 refs.)

117731 Efficiency of recording thermal neutrons with semicondcutor detectors having planar convertors. N.O.Elyutin, V.K.Lyapidevskii, A.O.Nikitin, B.G.Perezhogin.

Instrum. & Exp. Tech. (USA), vol.25, no.5, pt.1, p.1107-10 (Sept.-Oct. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.5, p.62-4 (Sept.-Oct. 1982). [received: Sept. 1983]

The possibilities of building highly efficient semiconductor detectors with ^{6}Li and ^{10}B convertors for thermal neutrons are discussed. The experimental results obtained in research with silicon semiconductor detectors are analyzed. (5 refs.)

117732 Scintillator hodoscope system for a high intensity beam. M.De Palma, G.Macchia, G.Maggi, A.Ranieri, A.Sacchetti, G.Selvaggi, P.Spinelli.

Report INFN/TC-83/11, Ist. Naz. Fis. Nucl., Bari, Italy (16 May 1983), 9 pp.

Describes the construction and the operation of a scintillator hodoscope used in an intense beam. By using a fast scintillator (Pilot U), a XP1910 photomultiplier and an electronic chain, employing a fast Zero Crossing discriminator located close to the hodoscope and a differential discriminator as receiver in the counting room, a two pulse separation of 6 nsec per channel and a time resolution (σ) of 210 psec were obtained. (8 refs.)

117733 Major detectors in elementary particle physics. G.Gidal, B.Armstrong, A.Rittenberg.

Report LBL-91 Supplement (DE-AC03-76F00098), Univ. California, Lawrence Berkeley Lab., Berkeley, USA (March 1983), 86 pp.

This report is the first edition of a loose leaf compendium of the properties and performance characteristics of the major detectors of elementary particle physics.

29.60 COUNTING CIRCUITS AND NUCLEAR ELECTRONICS

117734 Interfacing the AI-4096 multidimensional analyzer to the Nairi-K computer. A.P.Zakharnev, N.B.Malevannaya.

Instrum. & Exp. Tech. (USA), vol.25, no.5, pt.1, p.1111-13 (Sept.-Oct. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.5, p.65-7 (Sept.-Oct. 1982). [received: Sept. 1983]

A method is described for interfacing the AI-4096 multidimensional pulse analyzer and the Nairi-K computer, permitting programmed data transfer between the devices. Data are transferred as an 18-bit binary code, and in practice, the data transfer rate is limited only by the computer speed, being $\geq$2000 numbers/sec. (6 refs.)

117735 Multichannel amplitude analyzer using the 'MERA-60' microcomputer. B.V.Fefilov, Nguen Hak Thi (Joint Inst. of Nuclear Res., Dubna, USSR).

Instrum. & Exp. Tech. (USA), vol.25, no.5, pt.1, p.1113-15 (Sept.-Oct. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.5, p.67-9 (Sept.-Oct. 1982). [received: Sept. 1983]

A 4096-channel amplitude analyzer based on the MERA-60/10 microcomputer and standard CAMAC modules is described. The system permits programmed automation of data collection and processing in activation analysis. Any 256-channel wide sector of the amplitude histogram can be displayed on the monitor screen, as can the addresses and contents of marker channels and other auxiliary information. Energy calibration and calculation of integral sums of specified spectral zones is possible, and various forms of hard copy output are provided. Up to eight spectral zones can be processed simultaneously. (14 refs.)

29.70 RADIATION MEASUREMENT, DETECTION AND COUNTING

(see also 29.30 Radiation spectrometers and spectroscopy, 29.40 Radiation detectors; for dosimetry, see 87.60M)

117736 Application of two-stage 4π LS-γ coincidence method in the measurement of ^{75}Se activity. A.Chylinski, T.Radoszewski, T.Kempisty (Inst. of Atomic Energy, Swierk, Poland).

Int. J. Appl. Radiat. & Isot. (GB), vol.34, no.8, p.1175-80 (1983). (Applied Radionuclide Metrology, Geel, Belgium, 16-17 May 1983).

The main difficulty in ^{75}Se counting is due to a delay in gamma-ray emission of about 17 ms. The anticoincidence method cannot be used, as the delay is too significant. The coincidence extrapolation method has been applied with an efficiency function for X-ray and electron counting in a liquid scintillation (LS) coutner. The extrapolated counting rate contains the decay rate of ^{75}Se but also conversion electrons from the delayed gamma emission and some additional effect due to the efficiency of LS for the delayed gamma rays. This effect is determined by the first correction factor. The second correction factor is concerned with the Compton effect in a gamma-ray-counting channel of the scintillation counter with an NaI (Tl) crystal, i.e. scattered gamma rays from the delayed gamma rays. This effect cannot be avoided even if the channel window is set in such a way that the delayed radiation was not counted directly. The second correction factor was obtained from ^{51}Cr measurements, where the detector efficiency was calculated for the scattered gamma rays from the 320-keV gamma ray. (5 refs.)

117737 Detection of synchrotron radiation under the conditions of pulsed noise. V.M.Lachinov, A.A.Mal'tsev, V.P.Filin (Joint Inst. for Nuclear Res., Dubna, USSR).

Instrum. & Exp. Tech. (USA), vol.25, no.5, pt.1, p.1084-8 (Sept.-Oct. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.5, p.43-7 (Sept.-Oct. 1982). [received: Sept. 1983]

A two-channel system is described for the detection of synchrotron radiation in the prototype of a collective heavy-ion accelerator under the conditions of a higher level of electromagnetic noise. The radiation is recorded in the spectral region 0.4-4.5 μm in two channels, a silicon photodiode being the detector in one channel and a lead selenide photoconducting cell. Electromagnetic disturbances are effectively suppressed in the system. The amplitude of the synchrotron radiation is measured with a relative accuracy of 0.2%. (4 refs.)

117738 Experimental study of charcoal adsorptive technique for measurement of radon in air. M.Shimo, Y.Ikebe, J.Maeda (Dept. of Nuclear Engng., Nagoya Univ., Nagoya, Japan), R.Kamimura, K.Hayashi, A.Ishiguro.

J. At. Energy Soc. Jpn. (Japan), vol.25, no.7, p.562-70 (July 1983). In Japanese.

A method for sampling of Rn in air was experimentally studied. Radon gases flowing at 5 *l*/min are adsorbed on activated charcoal (5 g) in a column which is set in a coolant with dry ice and ethanol. The adsorbed Rn is transferred to an ionization chamber by heating the charcoal trap. The activity of Rn is then determined by the currents. The gross collection efficiency of this system was evaluated to be 0.88 ± 0.05 in the region of 50-1200 pCi/m^3. An example of measurements obtained by this method is presented. The air concentration of Rn in a closed room in found to be 4000-5000 pCi/m^3. (13 refs.)

117739 Search for massive magnetic monopoles by plastic track detectors. T.Doke, T.Hayashi, R.Hamasaki, T.Akioka, T.Naito (Sci. & Engng. Res. Lab., Waseda Univ., Tokyo, Japan), K.Ito, T.Yanagimachi, S.Kobayashi, T.Takenaka, M.Ohe, Nagata K., T.Takahashi.

Phys. Lett. B (Netherlands), vol.129B, no.5, p.370-4 (29 Sept. 1983).

A search for massive magnetic monopoles, predicted by the grand unified theories, has been performed using plastic nuclear track detectors (cellulose nitrate) with a total area of about 100 m^2, which were exposed at ground level for 3.3 yr. The effective solid angle for detection of monopoles is estimated over the velocity range $0.03c<v<0.2c$. An upper limit of 5.2×10^{-15} cm^{-2} s^{-1} sr^{-1} at 90% CL is obtained for the flux of unit magnetic monopoles with velocities higher than $0.04c$. (15 refs.)

29.80 NUCLEAR INFORMATION PROCESSING

117740 FASTBUS—a standard for the design of high-speed, fourth-generation electronic apparatus (review). S.G.Basiladze (Joint Inst. for Nuclear Res., Dubna, USSR).

Instrum. & Exp. Tech. (USA), vol.25, no.5, pt.1, p.1041-64 (Sept.-Oct. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.5, p.5-27 (Sept.-Oct. 1982). [received: Sept. 1983]

A new standard is described for the design of high-performance multichannel electronic systems with distributed 'intelligence' that are based on the widespread implementation of large-scale integration (LSI) integrated circuits. The standard must serve as the structural and construction base of high-performance fourth-generation nuclear-physics apparatus. (11 refs.)

117741 Mathematical modelling for experimental physics data processing. A.N.Tichonov, V.Ja.Galkin.

In *Collection of scientific papers in collaboration with joint Institute for Nuclear Research, Dubna, USSR and Central Research Institute for Physics, Budapest, Hungary. Algorithms and programs for solution of some problems in physics. Vol.IV*, p.1-21. Report KFKI-1983-21, Hungarian Acad. Sci., Budapest (1983), 191 pp.

Statistical models for experimental physics data processing, mostly for gamma-interactions, are presented. Mathematical models of automatic measurements, hardware influence, multiplicity nuclear processes separation, Mossbauer spectroscopy and gamma-radiation kinetics are studied. Some direct and inverse problems formulations and decision results are discussed. (39 refs.)

30.00 ATOMIC AND MOLECULAR PHYSICS

(for physical chemistry, see 82.)

31.00 THEORY OF ATOMS AND MOLECULES

(see also 71. Electron states in condensed matter)

31.10 GENERAL THEORY OF STRUCTURE, TRANSITIONS AND CHEMICAL BINDING

117742 Time-reversal symmetry, Kramers' degeneracy and the algebraic eigenvalue problem. N.Rosch (Lehrstuhl fur Theoretische Chem., Tech. Univ. Munchen, Garching, Germany).
Chem. Phys. (Netherlands), vol.80, no.1-2, p.1-5 (Oct. 1983).
A method is presented whereby time-reversal symmetry may be fully exploited in systems exhibiting Kramers' degeneracy. A basis adapted to time-reversal symmetry, i.e. consisting of Kramers pairs, will be transformed into another of the same structure by symplectic unitary or, equivalently, by quaternionic unitary transformations. Only one quaternionic hermitean eigenvalue problem of half the original order has to be solved for each Kramers pair. This leads to a significant reduction of the necessary computational effort. (17 refs.)

117743 Geometries of van der Waals complexes of small polar molecules. J.T.Brobjer, J.N.Murrell (School of Chem. & Molecular Sci., Univ. of Sussex, Brighton, England).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.9, p.1455-64 (Sept. 1983).
The geometries of most known van der Waals complexes between small polar molecules agree well with those calculated to be optimum for the electrostatic energy at the experimental intermolecular separation. This conclusion has been reached by calculating the electrostatic energy using a multipole-fitted point-charge model. (66 refs.)

117744 Numerical properties of the convolution theorems of *B* functions. E.J.Weniger, E.O.Steinborn (Inst. fur Phys. & Theoretische Chem., Univ. Regensburg, Regensburg, Germany).
Phys. Rev. A (USA), vol.28, no.4, p.2026-41 (Oct. 1983).
For the computation of convolution integrals of *B* functions [Eq. (2.14) of E. Filter and E.O. Steinborn, Phys. Rev. A 18, 1 (1978)] which are a special class of exponential-type functions, different analytic representations are available. The authors have investigated the numerical properties of these convolution formulas and found out that results of sufficient accuracy can be obtained for molecular calculations. They have also investigated the numerical properties of the corresponding one-center integrals. Some new mathematical properties of *B* functions that are essential for the understanding of the numerical properties of the convolution formulas are derived. (50 refs.)

117745 Modified-Hill-determinant method for the hydrogen molecular-ion problem. R.S.Bhattacharjee, R.P.Saxena, P.K.Srivastava (Dept. of Phys. & Astrophys., Univ. of Delhi, Delhi, India), K.V.Sane.
Phys. Rev. A (USA), vol.28, no.4, p.2042-50 (Oct. 1983).
The problem of the H_2 molecular ion is reinvestigated with the use of a method of truncated Hill determinants. Modified Hill determinants are found such that the truncations thereof form a convergent sequence. The wave functions obtained from the present formulation are expected to be more reliable than those reported earlier and in fact are shown to be orthonormal to one part in 10^6. Equilibrium bond lengths (R_e), stiffness constants, and the wave functions at R_e for various states are presented. (23 refs.)

117746 Effective shell charge of electrons on a sphere—a discussion of Hund's rules, negative ions and the chemical bond. H.Essen (Dept. of Chem., McMaster Univ., Hamilton, Ontario, Canada).
Theor. Chim. Acta (Germany), vol.63, no.4, p.365-76 (1983).
By ignoring the radial motions of the electrons in the valence shell of an atom one formally obtains the problem of electrons constrained to move on a sphere. This sphere will be attracted by the core as if it had an effective charge equal to the number of electrons on it minus a certain quantity resulting from the mutual repulsion of the electrons. This 'effective shell charge' is a very simple, but still precise and quantitative concept which provides a good understanding of many empirical facts about atoms and ions, most notably Hund's rules. Implications for negative ions are discussed and chemical bonding is touched briefly. A qualitative difference in physical behavior for small and large sphere radii is pointed out. (22 refs.)

117747 Energy-density relations in momentum space. II. Generalization. T.Koga, T.Miyahara, M.Morita (Dept. of Appl. Chem., Muroran Inst. of Technol., Hokkaido, Japan).
Theor. Chim. Acta (Germany), vol.63, no.4, p.377-81 (1983).
For pt.I see ibid., vol.59, p.639 (1981). Rigorous relations are derived between the electronic energy and the electron momentum density of a molecular system whose Hamiltonian takes the form of $g(\lambda)T(\{\mathbf{r}\})+h(\lambda)V(\{\mathbf{r}\};\{\mathbf{R}\})$ and depends on a parameter λ. (8 refs.)

117748 The periodic system for diatomic molecules: group-theoretical approach. G.V.Zhuvikin, R.Hefferlin.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.10-16 (Aug. 1983). In Russian.
The group-theoretical construction of the periodic system for diatomic molecules is suggested. Six quantum numbers are introduced for enumerating molecules. The system developed is in good agreement with the periodic system previously proposed on the basis of the tabulated data by Hefferlin and others (1979, 1980). (16 refs.)

117749 An analytic approximation for the energy levels of neutral atoms. R.Dutt (Dept. of Phys., Visva-Bharati Univ., Santiniketan, West Bengal, India), Y.P.Varshni.
Z. Phys. A (Germany), vol.313, no.3, p.143-5 (1983).
Using a screened Coulomb potential, a simple formula is obtained for the shell binding energy E_{ns} of a neutral atom which gives accurate results over the entire range of the atomic number upto 84. (10 refs.)

Critical behavior of a three-dimensional dimer model ....See Entry 117108

31.15 GENERAL MATHEMATICAL AND COMPUTATIONAL DEVELOPMENTS

117750 A new method for the calculation of the electronic properties of atoms and molecules. C.Valdemoro (Inst. de Fisica del Estado Solido, CSIC, Madrid, Spain).
An. Fis. Ser. A (Spain), vol.79, no.2, p.106-11 (May-Aug. 1983). [received: Oct. 1983]
The author presents the basic theory for the construction of a spin-adapted reduced-Hamiltonian matrix describing the electronic properties of an m-electron system. It is expected that the eigenvalues and eigenvectors of this matrix will led to the exact or good approximation values to the excitation energies of an m electron-system. (13 refs.)

117751 On determining the number of stochastic degrees of freedom in polyatomic molecules. J.R.Stine (Los Alamos Nat. Lab., Los Alamos, NM, USA), D.W.Noid.
Chem. Phys. Lett. (Netherlands), vol.100, no.3, p.282-6 (9 Sept. 1983).
Construction of dimensionality plots have proved useful for determining the number of integrals of the motion in dynamical systems with two and three degrees of freedom. The slow convergence in the method is caused by the trajectory not accessing phase space uniformly. Here an information dimension is shown to have better convergence properties. (15 refs.)

31.20 SPECIFIC CALCULATIONS AND RESULTS

117752 The formate anion: an ab initio study of its equilibrium structure, general harmonic force field and fundamental vibrational frequencies. A.R.Gregory (Dept. of Chem., West Virginia Univ., Morgantown, WV, USA), K.G.Kidd, G.W.Burton.
THEOCHEM (Netherlands), vol.13, no.1-2, p.9-22 (Sept. 1983).
The general harmonic force field (GHFF) of the formate anion has been calculated by ab initio restricted Hartree-Fock theory using the minimal STO-3G and split valence 4-31G basis sets. This work was carried out in conjunction with a previously reported experimental study in which the ion's force field was determined from its vibrational frequencies in polycrystalline sodium formate by an improved refinement procedure. The ab initio results reported proved valuable in the study as a guide to the true physical values of the harmonic force constants. (41 refs.)

117753 The relations between the valence angles of sp^3-hybridized central atoms for all possible local symmetries. B.Klahn (Lehrstuhl fur Theoretische Chem., Univ. Gottingen, Gottingen, Germany).
THEOCHEM (Netherlands), vol.13, no.1-2, p.49-77 (Sept. 1983).
The explicit analytic relations between the valence angles of sp^3 hybridized atoms are derived for the different cases of local symmetry (C_{2V}, C_s, C_1 and C_{3v}). These relations allow the calculation of all valence angles, if a complete set of independent angles is given. Restrictive conditions on the input data are also presented. Examples illustrate to what extent the derived formulae are obeyed by bond angles of molecular centres with coordination number four. (64 refs.)

117754 Ab initio study of rotational isomerism in cyclopropanecarboxaldehyde. G.R.De Mare, M.R.Peterson (Lab. de Chimie Phys. Moleculaire, Brussels Univ., Brussels, Belgium).
THEOCHEM (Netherlands), vol.13, no.1-2, p.115-30 (Sept. 1983).
The geometry of cyclopropanecarboxaldehyde has been optimized completely at each critical point in the torsional potential curve for −CHO group rotation by analytic gradient (force) methods at the STO-3G, 3-21G and 6-31G* basis set levels. In agreement with the available gas-phase electron-diffraction and microwave spectroscopy results, minima in the torsional potential energy curves are located only at the cis and trans conformations. The STO-3G basis computations place the cis 1.4 kJ mol^{-1} above the trans conformer and predict the barrier for the trans→cis rotation to be 13.8 kJ mol^{-1} at $\theta=99.3°$. The geometrical parameters obtained are compared with the corresponding values for vinylcyclopropane, acetaldehyde and glyoxal. Evidence is found for important geometry changes due to the attraction between the oxygen and adjacent ring hydrogen atoms in the cis-cyclopropanecarboxaldehyde rotamer. Electric dipole moments were computed with the optimized geometries at each critical point. (26 refs.)

117755 Parameterization of small basis set molecular orbital calculations for bond moment determination. B.J.McClelland, W.J.Orville-Thomas (Dept. of Chem., Univ. of Salford, Salford, England).
THEOCHEM (Netherlands), vol.13, no.1-2, p.147-53 (Sept. 1983).
A previously-described method of determining polar parameters of bonds from vibrational band intensities requires the estimation of the contribution of polarization terms to derivatives of the molecular dipole moment with respect to symmetry coordinates. A new procedure is proposed which uses ab initio minimum basis set molecular orbital calculations with valence shell orbital exponents scaled to reproduce the experimentally-determined dipole moment derivatives. The method is applied to the methane molecule and polar parameters of C-H bonds in this molecule are evaluated. (12 refs.)

117756 Tests of the orbital stasis and orbital following models. W.E.Palke, B.Kirtman (Dept. of Chem., Univ. of California, Santa Barbara, CA, USA).
THEOCHEM (Netherlands), vol.13, no.1-2, p.207-13 (Sept. 1983).
Two zeroth-order models of the orbital motion (i.e. the change in orbital direction) that occurs when a molecule bends have been proposed, namely orbital following and orbital stasis. These models are tested by comparing calculated parameters, which characterize the bending potential and electronic charge distribution, with experimental values for N_2O, NH_3, and H_2S. The available data, although somewhat limited, show a moderate-to-strong preference for orbital stasis. Additional tests are suggested. (15 refs.)

117757 Structures and conformations of cyclopentane, cyclopentene, and cyclopentadiene. S.Saebo, F.R.Cordell, J.E.Boggs (Dept. of Chem., Univ. of Texas, Austin, TX, USA).
THEOCHEM (Netherlands), vol.13, no.1-2, p.221-32 (Sept. 1983).
The structures and conformations of cyclopentane, cyclopentene, and cyclopentadiene have been investigated by SCF gradient ab initio computation with a double zeta basis set. For cyclopentane the half-chair (C_2) and the envelope (C_s) forms were found to be isoenergetic, consistent with the experimentally observed free pseudorotation. The barrier to coplanarity of the ring is 4.3 kcal mol^{-1}. Cyclopentene has a puckered C_s equilibrium conformation with a very low barrier to planarity. Cyclopentadiene has a planar ring. The compounds with 5, 3 and 1 methylene groups, respectively, show a decreasing tendency to form puckered rings as interaction between adjacent methylene groups becomes of less significance compared with the influence of angle strain which favors ring planarity. A corrected geometrical optimization of the half-boat (C_2) form of cyclohexane is also presented. (68 refs.)

117758 Polarizability and aromaticity of pyrimidine: a comment. G.L.D.Ritchie (School of Chem., Univ. of Sydney, NSW, Australia).
THEOCHEM (Netherlands), vol.13, no.1-2, p.247-50 (Sept. 1983).
The author comments on the recent attempt of Subbaiah et al. (ibid., vol.87, p.105, 1982) to elucidate the structure and aromaticity of pyrimidine by applying considerations of molecular polarizability to 2,4,6,-trifluoropyrimidine (1) and 2-amino-4,6-dichloropyrimidine (2). The author points out the paper appears to contain deficiencies which compromise the credibility of both the numerical results and the qualitative inferences drawn therefrom. (21 refs.)

117759 RHF-SCF-LCAO-MO calculations of the one-electron properties of H_2O, CH_3OH, CH_32CH_2OH. S.Tolosa Arroyo, F.J.Olivares del Valle (Dept. de Quimica Fisica, Univ. de Extremadura, Caceres, Spain).
An. Fis. Ser. A (Spain), vol.79, no.2, p.112-20 (May-Aug. 1983). [received: Oct. 1983]
One-electron properties of water, methanol and ethanol have been studied in order to gain insight on the dependence of the charge distribution localized at the O-H with respect to the radicals CH_3-, C_2H_5- and H-. Likewise, properties of the systems as a whole (multipolar moments and diamagnetic susceptibilites referred to the mass centre), have been investigated. The molecular wave function has been built by using a double-zenta basis according to the nonempirical RHF-SCF-LCAO-MO method. (25 refs.)

117760 The conformation of proline using the concept of pseudorotation. K.K.Chacko, S.Swaminathan, K.R.Veena (Dept. of Crystallography & Biophys., Univ. of Madras, Madras, India).
Curr. Sci. (India), vol.52, no.14, p.660-3 (20 July 1983).
Proline ring conformation based on best planes is only an approximate way of defining the conformation. A more rigorous approach is to use the concept of pseudorotation of the five membered pyrrolidine ring system. The authors develop a method of representation of the conformation based on the above concept. From the endocyclic torsion angles, the pseudorotational parameters p (phase angle) and τ_m (maximum amplitude of pucker) can be calculated. The true conformation of the proline ring is obtained by referring to the pseudorotational pathway chart. The conformation is conveniently represented by an abbreviated nomenclature. Sample data of pyrrolidine rings of 12 prolyl residues are given to bring out the salient features. (19 refs.)

117761 On the assignment of the HOMO in UF_6. N.Martensson, P.-A.Malmquist, S.Svensson (Inst. of Phys., Uppsala Univ., Uppsala, Sweden).
Chem. Phys. Lett. (Netherlands), vol.100, no.4, p.375-7 (16 Sept. 1983).
Electron spectroscopic measurements provide strong evidence that the HOMO in UF_6 is of t_{1g} symmetry and not t_{1u} which has been generally assumed. (12 refs.)

117762 Semiclassical self-consistent field calculations of Feshbach resonance energies. A.D.Smith, W.-K.Liu (Dept. of Phys., Univ. of Waterloo, Waterloo, Ontario, Canada).
Chem. Phys. Lett. (Netherlands), vol.100, no.5, p.461-5 (23 Sept. 1983).
Feshbach (compound-state) resonance energies are calculated for a model collinear collision system using the semiclassical self-consistent field method. Good agreement is obtained with previous accurate quantum, semiclassical and perturbation theory results. (22 refs.)

117763 Finite perturbation MCSCF and CI calculations of nuclear spin-spin coupling constants for some molecules with multiple bonds. A.Laaksonen, J.Kowalewski (Dept. of Phys. Chem., Univ. of Stockholm, Stockholm, Sweden), V.R.Saunders.
Chem. Phys. (Netherlands), vol.80, no.3, p.221-7 (15 Oct. 1983).
Nonempirical finite perturbation calculations at the Hartree-Fock, multiconfigurational self-consistent field and configuration interaction levels of approximation are presented for the Fermi contact contribution in multiply-bonded molecules ethene, formimide, formaldehyde, ethyne and hydrogen cyanide. The finite perturbation-multiconfigurational SCF (FPMC) method (with few configurations) is free from the UHF triplet instabilities normally present in single configuration coupled Hartree-Fock (CHF) calculations of the Fermi contact (and spin-dipolar) contribution for π-bonded systems. The behaviour of coupling constants, calculated using FPMC for multiply-bonded systems parallels the behaviour of the CHF coupling constants in comparable systems with single bonds only. The effects of dynamic electron correlations are important and are obtained using the CI method. After accounting for the orbital contribution by means of the single configuration CHF method, agreement with experiment is excellent for systems containing only carbon and hydrogen, when a double-zeta quality basis set is used. For systems containing nitrogen and oxygen agreement is still reasonable, but the use of larger basis sets seems to be necessary if good agreement with experiment is to be obtained. (39 refs.)

117764 A theoretical estimate for quasihomopolar singlet levels in long polyenes with a spin model hamiltonian. K.Hashimoto (Dept. of Phys., Kyoto Univ., Kyoto, Japan).
Chem. Phys. (Netherlands), vol.80, no.3, p.253-61 (15 Oct. 1983).
A spin model hamiltonian is employed to estimate the energy levels of quasihomopolar singlet states in long polyenes. To this end, the singlet excitation energies of the alternating spin chain are calculated as functions of γ and N using the Hartree-Fock method developed based on the spinless fermion formulism. The result indicates that the excitation energies decrease monotonically with increasing chain length in accord with the known experimental results. Using the parameters j and γ empirically determined from the data on short polyenes, an estimation is given for the energy levels of the lowest-lying 2^1A_g states as well as those of the second ^1B_u quasihomopolar states in long polymers. In particular, the 2^1A_g level in polyacetylene is predicted to be at 1.1 eV in good agreement with a recent photoluminescence result (1.19 eV). (31 refs.)

117765 Theoretical structure of the $B_2H_7^-$ anion. K.Raghavachari (Bell Labs., Murray Hill, NJ, USA), P.von Rague Schleyer, G.W.Spitznagel.
J. Am. Chem. Soc. (USA), vol.105, no.18, p.5917-18 (7 Sept. 1983).
Previous ab initio calculations on $B_2H_7^-$, like those in the literature, appeared to favor a linear D_{3d} structure. The authors were intrigued by the apparent discrepancy with experiment. Larger basis sets with polarization functions and especially corrections for the effects of electron correlation favor bent over linear C-H-C bridges. Thus, definitive studies on $B_2H_7^-$ need a similar degree of sophistication, which was not employed in the prior theoretical investigations. They report the results of such an examination which confirms bent B-H-B structures to be favored. (15 refs.)

117766 Structure of an electronically stabilized carbonyl ylide. E.P.Janulis, A.J.Arduengo,III (Dept. of Chem., Univ. of Illinois, Urbana, IL, USA).
J. Am. Chem. Soc. (USA), vol.105, no.18, p.5929-30 (7 Sept. 1983).
The authors report the first structure determination of a stable carbonyl ylide, tetramethyluronium tetrakis(trifluoromethyl)cyclopentadienylide. A variety of analogous thione ylides have been synthesized, and many of these ylides are stable and isolable. The most stable of these thione ylides are stabilized by a 'push-pull' electronic substitution pattern, and complete structural studies are available on these systems. Early attempts to use the same stratagem to stabilize carbonyl ylides were unsuccessful. The absence of stable 'push-pull' carbonyl ylides has been bothersome from a theoretical point of view. The stabilizing influence of the electron-donating and -releasing groups on thione ylides is believed to act in concert with a sulfur conjugate link between the termini. The diminished ability of oxygen to function as a conjugative link demands that the substituent groups perform a cappella in stabilizing the carbonyl ylide. Thus, if stable carbonyl ylides are possible, exceedingly effective electron-releasing and -donating groups will be required. The authors chose to attempt the synthesis of a carbonyl ylide by the reaction of an electron-deficient-carbene with a carbonyl compounds. (7 refs.)

117767 Cli_5, CLi_6, and the related effectively hypervalent first-row molecules, $CLi_{5-n}H_n$ and $CLi_{6-n}H_n$. II. P.von Rague Schleyer, E.U.Wurthwein, E.Kaufmann, T.Clark (Inst. fur Organische Chem., Freidrich-Alexander-Univ., Erlangen-Nurnberg, Erlangen, Germany), J.A.Pople.
J. Am. Chem. Soc. (USA), vol.105, no.18, p.5930-2 (7 Sept. 1983).
For pt.I see ibid., vol.104, p.5839 (1982). The octet rule predicts the stoichiometries of first-row hydrides remarkably well. Thus, 'CH_5' and 'CH_6' are only likely to exist as weak complexes between methane and a hydrogen atom or a hydrogen molecule. Surprisingly, when lithium is involved instead of hydrogen, the situation is completely different. Both trigonal-bipyramidal CLi_5 (1, D_{3h}) and octahedral CLi_6 (2, O_h) are indicated by ab initio calculations using the 3-21G basis set and full geometry optimization to be highly stable toward all possible dissociation reactions. The related series of molecules $CLi_{5-n}H_n$ (n=0-4) and $CLi_{6-n}H_n$ (n=0-5) behave similarly. A number of geometries were explored for each species; the lowest energy structures (with bond lengths and angles) are illustrated. Single point calculations with the larger 6-31G* basis set including correlation corrections at the MP2 level were performed on the smaller species. How is it possible for CLi_5, CLi_6, and the other hyperlithiated molecules to violate the maximum stoichiometry expected on the basis of the octet rule? The high symmeties and the C-Li distances in 1 and 2, only slightly longer than those found for CH_3Li (2.001 Å) or CLi_4 (1.929 Å) at 3-21G, show that all the lithiums are bound to carbon. Indeed, all these molecules exhibit the bonding that the authors find to be general for such hypermetalated species. (14 refs.)

117768 Bonding effects on the momentum densities of alkaline-earth oxides. B.S.Sharma, A.N.Tripathi (Dept. of Phys., Univ. of Roorkee, Roorkee, India), A.J.Thakkar.
J. Chem. Phys. (USA), vol.79, no.6, p.3164-5 (15 Sept. 1983).
A promising technique, applicable at all levels of theory and experiment, for examining the effects of bonding on the isotropic Compton profiles is to form the bond difference profile by subtrcting from the molecular profile the sum of the profiles of the moieties that are considered to come together to form the bond under consideration. Isotropic Compton profiles J(q) and their parent spherically averaged one-electron momentum densities $\Pi(p)$ for the alkaline-earth oxides are examined in order to see how they reflect similar but different bonding situations in this homologous series. (14 refs.)

117769 Lower-bound energy functionals and their application to diatomic systems. A.Berk (Dept. of Chem., Univ. of North Carolina, Chapel Hill, NC, USA).
Phys. Rev. A (USA), vol.28, no.4, p.1908-23 (Oct. 1983).
A systematic method for determining lower-bound energy functionals within both the density-functional and orbital frameworks is presented. Lower-bound calculations are carried out on the Thomas-Fermi-Dirac-1/5 von Weizsacker (TFD1/5W) diatomic nitrogen molecule and the Hartree-Fock (HF) diatomic hydrogen molecule. In the TFD1/5W model, binding is found but not as much as previously thought to exist. Furthermore, an anomaly in the behavior of the energy at short internuclear distances (~1 bohr) is discovered through comparisons with HF data. In the Hartree-Fock theory, a strict lower bound on the H_2 potential-energy curve is obtained without performing any two-electron integrals. A dissociation energy results, which is 6% more than the exact HF value. (24 refs.)

117770 Pseudopotential local-spin-density calculations for Si_2. J.E.Northrup, M.T.Yin, M.L.Cohen (Dept. of Phys., Univ. of California, Berkeley, CA, USA).
Phys. Rev. A (USA), vol.28, no.4, p.1945-50 (Oct. 1983).
Pseudopotential local-spin-density calculations of the bond lengths, vibrational energies, and dissociation energies for the $^3\Sigma_g{}^-$, $^3\Pi_u$, and two $^1\Sigma_g{}^+$ states of the silicon dimer have been performed. The bond lengths are within 1% and the vibrational frequencies are within 5% of experimental values. The dissociation energy of the ground state is larger than experiment by ~1.25 eV. These results are near the limits of accuracy of the local-spin-density approximation. (26 refs.)

117771 Approximate solution of the strongly magnetized hydrogenic problem with the use of an asymptotic property. W.Rosner, H.Herold, H.Ruder, G.Wunner (Inst. fur Theoretische Astrophys., Univ. Tubingen, Tubingen, Germany).
Phys. Rev. A (USA), vol.28, no.4, p.2071-7 (Oct. 1983).
It is shown that the effective potentials of the adiabatic approximation, which depend on the magnetic field parameter $\beta=B/B_0$ ($B_0\simeq4.70\times10^5$ T) and the quantum number $s=-\mathrm{m}\geq0$ of the z component of the angular momentum, asymptotically (i.e. for large s) can be traced back to one single potential function which solely depends on the ratio $p=\beta/(s+1/2)$. For this asymptotic potential, numerical solutions of the Schrodinger equation are determined in the range $10^{-3}\leq p\leq10^{+3}$ for $0\leq v\leq20$ (v being the number of nodes of the longitudinal wave function). Exploiting the concept of quantum excesses, the asymptotic energies are extrapolated to $v>20$. It is found that the asymptotic energies provide the energy values of the real physical problem of hydrogenic atoms in magnetic fields $\beta\gtrsim1$ within an accuracy of $\lesssim1\%$ for every $s\geq3$ and arbitrary v, with the accuracy improving rapidly, as β, s, or v is increased. Thus the authors' results ideally complement those for $s<3$ for which accurate results have been tabulated in the literature. (19 refs.)

117772 Ab initio study of the vibrational spectrum and geometry of oxetane. I. Interpretation of the vibrational spectra. G.Banhegyi (Res. Inst. for Plastics, Budapest, Hungary), P.Pulay, G.Fogarasi.
Spectrochim. Acta Part A (GB), vol.39A, no.9, p.761-9 (1983).
As a first step toward the understanding of the role the zero-point energy of the fast vibrations plays in the effective puckering potential of oxetane, the authors have evaluated the force field of this molecule at three different values of the puckering angle by ab initio SCF calculations, using the 4-21 basis set. The force constants of the planar configuration, scaled by six empirical parameters, were used to establish the assignment of the high-frequency fundamental vibrations of oxetane and four of its deutero derivatives. The authors' results support most of the empirical assignments made by Kydd, Wieser and Kiefer (1983), but in each isotopomer one of the B_1 (out-of-plane) fundamentals must be assigned to a much higher frequency than they assumed. Except for a few cases where deviations up to 40 cm^{-1} occur, as a probable consequence of the inadequate description of ring strain and large anharmonicity connected with puckering, the theoretical spectrum reproduces most experimental frequencies to within 20 cm^{-1}. (35 refs.)

117773 Approximation electric potentials. G.G.Hall (Dept. of Math., Univ. of Nottingham, Nottingham, England).
Theor. Chim. Acta (Germany), vol.63, no.4, p.357-64 (1983).
It is shown that the elecrostatic energy functional is the only one available for fitting a given potential using approximate electric potentials arising from point charges. The significance of this fitting is examined in terms of splines. To illustrate the method the electron densities of atoms are modelled using point charges at the vertices of tetrahedra and of cubes. (4 refs.)

117774 g-factors for a spherical-top molecule. I.R.Akhmedov.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.16-21 (Aug. 1983). In Russian.
Calculation of *g*-factors for a spherical-top molecule is considered. The energy for a spherical-top molecule is obtained in constant magnetic field. (9 refs.)

117775 Ground state structures of thiocyanogen and its cation. S.P.So (Dept. of Chem., Chinese Univ. of Hong Kong, Hong Kong).
THEOCHEM (Netherlands), vol.13, no.1-2, p.241-6 (Sept. 1983).
The ground state structures of thiocyanogen and its cation have been studied by ab initio calculations. Results show that they both have bent SCN linkages. Further, first ionization changes the H_2O_2-like structure of the parent molecule to a planar trans one. (35 refs.)

117776 Hydrogen-bond energies of FHF^- and $HOHF^-$. Ab initio studies of strong hydrogen bonds involving fluoride, using improved fluoride energies. J.Emsley, R.J.Parker (Dept. of Chem., King's Coll., London, England), R.E.Overill.
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.9, p.1347-53 (Sept. 1983).
Using a large flexible Gaussian basis set the calculated hydrogen-bond energy of FHF^- is 169 kJ mol^{-1}, which agrees well with a recent gas-phase ion cyclotron resonance determination of 163 kJ mol^{-1}. Reoptimization of the 4-31G and double-zeta basis-set scale factors for F results in substantially lower energies for the fluoride ion and also leads to much improved hydrogen-bond energies for FHF^-. A similar improvement is found for $HOHF^-$. The hydrogen-bond energy of the CH_3OHF^- complex is computed for the first time and shows good agreement with experiment. Other heteronuclear systems involving hydrogen bonding to F^- have been recalculated using this approach. (37 refs.)

117777 Compliant fields for water, ammonia, and methane. A.S.N.Murthy, S.Ranganathan (Dept. of Chem., Indian Inst. of Technol., New Delhi, India).
THEOCHEM (Netherlands), vol.13, no.1-2, p.1-8 (Sept. 1983).
An approximate and economical method has been developed to derive the quadratic potential functions using a combination of the CNDO/Force method and the compliance constant approach. This new approach has been used to determine the force constants and harmonic vibrational frequencies for the normal and isotopic species of water, ammonia and methane. The results are expressed in terms of internal valence compliance constants. (8 refs.)

117778 A CNDO/S-CI investigation of planar and orthogonal anisole. H.Konschin, M.Lindblad (Dept. of Chem., Univ. of Helsinki, Helsinki, Finland).
THEOCHEM (Netherlands), vol.13, no.1-2, p.37-47 (Sept. 1983).
CNDO/S-CI calculations for planar and orthogonal anisole (methoxybenzene) have been done with single excitation configuration interaction. Both singlet and triplet transition energies are reported for the two currently proposed β^0(O) parameterizations. The influence of internal rotation upon the features of the electronic spectra is discussed. Excited state charge distributions for singlet and triplet states are presented, and some photochemically interesting implications are discussed. Calculated ionization potentials are compared with available experimental data. (39 refs.)

117779 Theoretical force field and vibrational spectrum of maleimide by the CNDO/2 force method. L.Harsanyi (Res. Lab. for Inorganic Chem., Hungarian Acad. of Sci., Budapest, Hungary), P.Csaszar, G.Fogarasi, G.Horvath, I.Szilagyi.
THEOCHEM (Netherlands), vol.13, no.1-2, p.79-89 (Sept. 1983).
In-plane and out-of-plane vibrations of malemide have been studied by the CNDO/2 force method. To account for systematic errors, the direct theoretical force field was scaled by empirical factors optimized on the basis of experimental frequencies. The calculations suggest some new assignments in the vibrational frequencies. (3 refs.)

117780 MINDO/3 study of the hydrogen insertions of cyclopropenylidene and cyclopropylidene. H.T.Tsang, W.K.Li (Dept. of Chem., Chinese Univ. of Hong Kong, Hong Kong).
THEOCHEM (Netherlands), vol.13, no.1-2, p.95-104 (Sept. 1983).
The least-motion and non-least motion paths of the hydrogen insertions of cyclopropenylidene (I) and cyclopropylidene (II) have been studied with the MINDO/3 method. It is found that, for both reactions, the non-least-motion path is preferred. The concerted non-least-motion paths of both reactions consist of two distinguishable steps, an electrophilic phase followed by a nucleophilic phase. The former is characterized by the formation of a three-centre bond; electron flows from the σ orbital of H_2 into the p_π orbital of the carbenic centre. In the nucleophilic phase, the H-H bond is broken as the carbene lone pair attacks the σ^* orbital of H_2. Due to the higher p_π population at the carbenic centre of (I), the transition state for the reaction of H_2+(I) occurs much later than that for H_2+(II). Also, this brings about the larger activation energy for the former reaction. (9 refs.)

117781 Molecular fragmentations. XIV. Structures and energies of the mass spectral fragments derived from the methylphosphines. J.R.Bews, C.Glidewell (Chem. Dept., Univ. of St. Andrews, St. Andrews, Fife, Scotland).
THEOCHEM (Netherlands), vol.13, no.1-2, p.105-14 (Sept. 1983).
For pt.XIII see ibid., vol.94, p.305 (1983). Molecular structures and energies have been calculated, using the MNDO method with UHF wavefunctions for open shell species, for the molecular and all the fragment ions, and their associated neutral fragments, occurring in the mass spectra of methylphosphine, dimethylphosphine and trimethylphosphine. (11 refs.)

117782 Computer-assisted studies of hypolipidemic drugs. C.Tosi, L.Barino (Istituto Richerche 'Guido Donegani', Novara, Italy), P.Melloni, F.Salvetti.
THEOCHEM (Netherlands), vol.13, no.1-2, p.135-45 (Sept. 1983).
Studies of the molecular structure of clofibrate and the ethyl ester of 6-H, 6-methyl-dibenzo [b,d] pyran, 6-carboxylic acid are reported. Stable conformers have been determined by the quantum mechanical semirigorous method PCILO, some results being backed by the all-electron method IBMOL. The best steric fit between these conformers is evaluated using the program FMFIT. It is found that clofibrate has limited conformational freedom. The introduction of a phenyl ring in place of one of the methyl groups of clofibrate and the linkage of the two phenyl rings in the dibenzo [d,b] pyran structure imparts a highly rigid structure to the molecule. Matching the ethyl ester and the aryloxy moieties of both molecules simultaneously would force clofibrate into an impossible formation: if the constraint of superimposition of the phenyl rings is limited to the baricentres, a good fit can be achieved between low-energy conformers. The different pharmacological activities might be related to the different orientations of the rings. (15 refs.)

117783 Calculation of solvent and internal rotation effects on $^3J_{FH}$ and $^3J_{HH}$ spin-spin coupling constants in 1,2-difluoroethane. S.Watanabe (Minato High School of Technol., Tokyo, Japan), I.Ando.
THEOCHEM (Netherlands), vol.13, no.1-2, p.155-61 (Sept. 1983).
The effects of rotation around the C-C bond and solvent dielectric constants (ε) on $^3J_{FH}$and $^3J_{HH}$ in 1,2-difluoroethane(1,2-DFE) have been studied. $^3J_{FH}$ and $^3J_{HH}$ in 1,2-DFE have been calculated by FPT-INDO-Solvaton method, and are compared with experimental values. The results indicate that an increase in $^3J_{FH}$in 1,2-DFE with increasing ε is not due to a change of conformation caused by increasing ε, but is caused by variation in the electronic structure of 1,2-DFE as a solute. Also, an increase of ε leads to a decrease of *p* character in the F...H bond (an increase of *s* character), an increase in the *p* character of the F atom, and an increase of the difference (Δq_{FH}) in charge density between F...H atoms. (7 refs.)

117784 Some INDO parameterised MO calculations of cobalt nuclear shielding in some diamagnetic hexacoordinate cobalt(III) complexes. B.N.Lamphun, G.A.Webb (Dept. of Chem., Univ. of Surrey, Guildford, England).
THEOCHEM (Netherlands), vol.13, no.1-2, p.191-6 (Sept. 1983).
Some ^{59}Co nuclear shieldings are calculated by means of Pople's model in conjunction with INDO parameters. Reasonable agreement between calculated and observed ^{59}Co chemical shifts, relative to $[Co(CN)_6]^{3-}$, is reported. The interpretation of the chemical shift differences in terms of variations in $\langle r^{-3}\rangle_{3d}$ and ΔE is examined. (27 refs.)

117785 Theoretical studies on conformational isomerism of bifurans and bipyrroles. E.Orti, F.Tomas, J.Sanchez-Marin (Dept. de Quimica-Fisica, Univ. de Valencia, Valencia, Spain).
THEOCHEM (Netherlands), vol.13, no.1-2, p.197-206 (Sept. 1983).
An INDO-SCF-LCAO-MO study has been performed for all isomers of bifurans and bipyrroles. The conformational problem for these molecules has been studied by performing a complete geometry optimization for each conformation. The trans conformers are the most stable for all isomers except for 2,3′-bifuran where the greater stability corresponds to the cis conformer. The torsional barrier about the interannular bond is also estimated for all isomers, together with total geometry optimization. The barriers are of relative significance but enable attainment of equilibria between both conformers. The particular case of 1,1′-bipyrrole, where an angular conformation presents the greater stability as a compromise between the contrary effects of nonbonded interactions and interannular conjugation, is discussed. The importance of performing geometry optimization on conformational problems is established. (31 refs.)

117786 A comparison of the molecular orbital (ab initio, CNDO and EHT) methods applied to the conformational study of thiocarbonohydrazide in its basic and diprotonated forms. S.Manogaran, D.N.Sathyanarayana (Dept. of Inorganic & Phys. Chem., Indian Inst. of Sci., Bangalore, India).
THEOCHEM (Netherlands), vol.13, no.1-2, p.215-20 (Sept. 1983).
Conformational preferences of thiocarbonohydrazide ($H_2NNHCSNHNH_2$) in its basic and *N,N*′-diprotonated forms are examined by calculating the barrier to internal rotation around the C-N bonds, using the theoretical LCAO-MO (ab initio and semiempirical CNDO and EHT) methods. The calculated and experimental results are compared with each other and also with values for *N,N*′-dimethylthiourea which is isoelectronic with thiocarbonohydrazide. The suitability of these methods for studying rotational isomerism seems suspect when lone pair interactions are present. (26 refs.)

117787 The use of transformation matrices to follow the change in electronic structure of some simple organic molecules upon ionization. G.Frenking (Inst. fur Organische Chem., Tech. Univ. Berlin, Berlin, Germany).
THEOCHEM (Netherlands), vol.13, no.1-2, p.233-9 (Sept. 1983).
MNDO calculations have been performed for the molecules CH_3X (X=H, F, OH, NH_2) and C_2H_n (n=2,4,6) and for the corresponding radical cations. Transformation matrices are calculated between the MO's of the neutral and charged species for vertical and adiabatic ionization. These matrices are then

used to interpret the associated changes in the geometrical and electronic structures. (22 refs.)

117788 Derivation of theoretical formulas for resonance integrals from Heisenberg equation of motion. II. Inclusion of Rydbern and/or inner atomic orbitals in the formalism of NDO-methods. J.Lipinski (Inst. of Organic & Phys. Chem., Tech. Univ. of Wroclaw, Wroclaw, Poland), J.Leszczynski.
Theor. Chim. Acta (Germany), vol.63, no.4, p.305-12 (1983).
On the basis of the Heisenberg equation of motion and Linderberg-Seamans approximations useful formulas for β-resonance integrals in the NDO-like semiempirical methods have been derived. The case of *s,p*-electron elements has been investigated. The possibility of inclusion of Rydberg and/or inner orbitals in the basis set of the valence orbitals has been taken into consideration. The results of the test INDOL/R method calculations of vertical transition energies for H_2 and H_2O molecules has been presented. (28 refs.)

31.20R Valence bond calculations (ab initio or not)

117789 Calculation of the hydrogen molecule by means of a parametrization obtained from the hydrogen ion-molecule. O.Stradella, G.A.Arteca, E.A.Castro, F.M.Fernandez (Seccion Quimica Teorica, INIFTA, La Plata, Argentina).
J. Phys. Lett. (France), vol.44, no.18, p.L741-53 (15 Sept. 1983).
The electronic energy function of the hydrogen molecule is calculated on the basis of the two simplest and most typical wave functions (MO-LCAO and VB) by introducing a reduction factor for the interelectronic repulsion and other functional parameters modifying the expectation values of both kinetic and potential energies. Such factors are associated to the CI contribution and some of them are calculated from the hydrogen ion-molecule. The comparison with the exact results shows a satisfactory agreement in binding energy, bond length and energy minimum values for the ground state. Some possible extensions of the method are discussed. (15 refs.)

31.20T Electron correlation and CI calculations

117790 Theoretical investigation of the interaction of propene with a sodium ion. R.Lochmann, T.Weller (Sektion Phys., Karl-Marx-Univ., Leipzig, Germany).
THEOCHEM (Netherlands), vol.13, no.1-2, p.91-4 (Sept. 1983).
An investigation of the interaction of propene with a sodium ion has been carried out by ab initio STO-3G, PCILO, and molecular electrostatic potential using PCILO wave function methods. In contrast to the results of 2-methylpropene (isobutene) ab initio and PCILO agree qualitatively in revealing the stable arrangement of the sodium ion in the area above the final carbon of the double bond to be due to a dominating charge transfer interaction. The electrostatically favoured arrangement of the sodium ion in the region in front of this carbon atom as predicted by the molecular electrostatic potential method, plays a less essential role than for 2-methylpropene. (10 refs.)

117791 Electron affinity of para-benzoquinone by ab initio ΔSCF calculations and semiempirical estimation of electron correlation energy. S.Millefiori, A.Millefiori (Univ. di Catania, Catania, Italy).
THEOCHEM (Netherlands), vol.13, no.1-2, p.131-4 (Sept. 1983).
The electron affinity of para-benzoquinone was computed by ab initio STO-3G and 4-31G ΔSCF calculations and by estimating the electron correlation energy by the semiempirical method of Sinanoglu and co-workers (1962-77). The electron-correlation energy associated with the formation of the mononegative anion is greater than the relaxation energy and amounts to 1.4 eV. The best present estimate of the electron affinity of para-benzoquinone is 2.20 eV, in fair agreement with experimental findings. The negative electron affinity (shape resonance) of benzene was also fairly well reproduced as −1.32 eV. The electron-correlation energy favours the formal disproportionation reaction in the gas phase $2PBQ^{1-} \rightarrow PBQ + PBQ^{2-}$ by 0.45 eV. (19 refs.)

117792 A non-van der Waals minimum of the $He(^1S)+H_2(B^1\Sigma_u^+)$ excited surface. S.C.Farantos, G.Theodorakopoulos, C.A.Nicolaides (Theoretical & Phys. Chem. Inst., Nat. Hellenic Res. Foundation, Athens, Greece).
Chem. Phys. Lett. (Netherlands), vol.100, no.3, p.263-7 (9 Sept. 1983).
The authors carried out MRD CI calculations for the first excited state of HeH_2 ($^1A'$) at geometries which have He (^1S) approaching the center of mass of H_2 ($B^1\Sigma_u^+$) at 45°. The calculated energies yield a barrier of 0.24 eV and a minimum of 1.5 eV. This minimum occurs near an avoided crossing with the ground-energy surface which is not found for collinear or perpendicular geometries. These results suggest an explanation for the electronic quenching of $HD(B^1\Sigma_u^+)$ in the presence of He observed by Moore and co-workers. (16 refs.)

117793 Relativistic molecular structure calculations including CI for several low lying states of SnO. K.Balasubramanian, K.S.Pitzer (Dept. of Chem., Univ. of California, Berkeley, CA, USA).
Chem. Phys. Lett. (Netherlands), vol.100, no.3, p.273-6 (9 Sept. 1983).
Relativistic quantum calculations including configuration interaction and spin-orbit interaction are described for seven low-lying Λ-S states of SnO and the corresponding ω-ω states with spin-orbit interaction. Spectroscopic properties of these states are computed and compared with experimental results. Properties are predicted for several low-lying electronic states that have not yet been observed experimentally. (9 refs.)

117794 Configuration interaction with Xα orbitals. A CI and RSPT study of the ground and ionized states of the Be atom. G.de Alti, P.Decleva, A.Lisini (Istituto di Chimica, Univ. di Trieste, Trieste, Italy).
Chem. Phys. Lett. (Netherlands), vol.100, no.4, p.371-4 (16 Sept. 1983).
Configuration-interaction calculations are carried out for the ground and ionized states of the Be atom with various bases of numerical Xα orbitals. These bases prove to be moderately effective for correlating the outer shell, while no correlation involving the inner electrons is achieved. This deficiency is attributed to the spatial nature of the virtual Xα orbitals. (18 refs.)

117795 The correlated electron density of alkali atoms: pseudopotential and density-functional results. A.Savin, M.Dolg, H.Stoll, H.Preuss (Inst. fur Theoretische Chem., Univ. Stuttgart, Stuttgart, Germany), J.Flesch.
Chem. Phys. Lett. (Netherlands), vol.100, no.5, p.455-60 (23 Sept. 1983).
Correlation contributions to the valence-electron densities of the Na and K atoms are evaluated by means of pseudopotential and density-functional methods. The results are compared to ab initio values, and reference is made to previous calculations for Li. (20 refs.)

117796 Conformational energetics in hydrogen-bonded dimers. The unobserved CO-HF complex. M.A.Benzel, C.E.Dykstra (School of Chem., Univ. of Illinois, IL, USA).
Chem. Phys. (Netherlands), vol.80, no.3, p.273-8 (15 Oct. 1983).
Ab initio electronic-structure calculations with large basis sets and extensive treatment of electron correlation have been carried out for the CO-HF complex. The potential surface exhibits a local minimum for linear Co-HF that is over 400 cm^{-1} above the absolute minimum that corresponds to the OC-HF structure. The main reason for the difference in the stabilities of the two conformers is the difference in their electron-correlation energies. The interconversion of CO-HF to OC-HF follows a minimum-energy path that takes the complex through a structure where the fluorine end of HF points into the middle regions of CO. (47 refs.)

117797 Influence of electron correlation on the spectra of streptopolymethines. F.Dietz (Section Chem., Univ. Leipzig, Leipzig, Germany), J.Fabian, G.Olbrich, N.Tyutyulkov, I.Kanev.
Izv. Khim. Bulg. Akad. Nauk. (Bulgaria), vol.15, no.4, p.519-24 (1982). [received: Sept. 1983]
Calculations on odd-numbers polyene ions and corresponding α, ω—substituted analogues in PPP approximation with CI including doubling excited configurations demonstrate the significant influence on the calculated spectra by taking into account the effect of electron correlation. (23 refs.)

117798 Hydrogen bonding in excited states of pyridine and pyrazine. C.V.Rama Rao, C.Jacob, A.K.Chandra (Dept. of Inorganic & Phys. Chem., Indian Inst. of Sci., Bangalore, India).
Indian J. Chem. A, vol.22A, no.3, p.183-5 (March 1983). [received: Oct. 1983]
Hydrogen bonding in the excited n-π^* and π-π^* states of pyridine and pyrazine has been examined by calculating the electric field at different points in space from the CNDO charges. Results reveal that the hydrogen bond which is formed in the ground state is broken upon excitation to the n-π^* state in pyridine while a weak hydrogen bonding is possible in the n-π^* state of pyrazine. (13 refs.)

117799 Theoretical equilibrium geometry, vibrational frequencies and the first electronic transition energy of HCC. G.Fogarasi, J.E.Boggs (Dept. of Chem., Univ. of Texas, Austin, TX, USA), P.Pulay.
Mol. Phys. (GB), vol.50, no.1, p.139-51 (Sept. 1983).
Ab initio calculations with the 6-311 G** basis set and all single and double excitations in the CI treatment have been carried out to determine the structure of the HCC radical. The theoretical geometry of R(CC)=1.209, r(CH)=1.067 Å (or 1.205 and 1.063, respectively, if corrected for residual errors) is in excellent accordance with the experimental rotational constant. The calculated harmonic vibrational frequencies are $\nu_1 \simeq 3450$, $\nu_2 \simeq 540$ and $\nu_3 \simeq 2040$ cm^{-1}. An extremely low energy around 2000 cm^{-1} is obtained for the first electronic transition $A^2\Pi \leftarrow X^2\Sigma$. Results for the excited state are also given. The theoretical vibrational frequencies, with all possible errors taken into account, are inconsistent with the accepted interpretations of the few experimental results. It is shown, however, that a complete reinterpretation of the spectroscopic observations is possible, by which the present calculations fit with the recent gas phase infrared laser spectroscopic data but remain in definite contradiction with the infrared matrix results. (20 refs.)

117800 Configuration mixing within the 2*s*-2*p* shell. C.Wulfman (Dept. of Phys., Univ. of Canterbury, Christchurch, New Zealand).
Phys. Rev. Lett. (USA), vol.51, no.13, p.1159-62 (26 Sept. 1983).
The Coulombic Hamiltonian of atoms approximately commutes with an N-electron operator which is a sum of O(4) Casimir operators. This accurately fixes configuration mixing within the entire 2*s*-2*p* shell. Several aspects of the stability of the results are discussed. (8 refs.)

117801 Collective and independent-particle motion in doubly excited two-electron atoms. G.S.Ezra, R.S.Berry (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA).
Phys. Rev. A (USA), vol.28, no.4, p.1974-88 (Oct. 1983).
Configuration-interaction wave functions are calculated for all intrashell doubly excited states of the $N=2$ shell for He and isoelectronic ions Li^+, Be^{2+}, and Ne^{8+} with the use of a basis of Sturmian functions. The density function $\rho(r_1,\theta_{12}|r_2=\alpha)$, which is the conditional probability that one electron will be found at distance r_1 from the nucleus with interelectronic angle θ_{12} given that the other electron is at distance α from the nucleus, is computed for each of the states and for various values of α. Density plots for the $^1S^e$ states of He are compared with those from Hylleraas-Kinoshita wave functions to assess the quality of the Sturmian basis. Sequences of plots are then examined to investigate the possibility of collective motion in doubly excited states. For He the form of the densities $\rho(r_1,\theta_{12}|\alpha)$ is in qualitative accord with the molecular model proposed by Kellman and Herrick (1978) in that the collective rotational and bending vibrational states are readily identifiable. With increasing nuclear charge a transition occurs to less collective behavior, corresponding to superpositions of hydrogenic configurations associated solely with the $N=2$ shell. Some states, e.g. $^1D^e$, correspond to single independent-particle configurations. Electron density distributions are also presented for the lowest S and P states of the He $n_1=2$, $n_2=3$ intershell manifold with a view to extension of the molecular interpretation to this case. Results are compared with those of calculations of the quantum states of model problems such as particles on concentric spheres. (49 refs.)

117802 Electronic configuration mixing and isotope shifts in singly ionized dysprosium. S.A.Ahmad, A.Venugopalan, G.D.Saksena (Spectroscopy Div., Bhabha Atomic Res. Centre, Bombay, India).
Spectrochim. Acta Part B (GB), vol.38B, no.8, p.1115-24 (1983).
The isotope shifts in 62 spectral lines of the singly ionised dysprosium in the region 3860-4665 Å have been studied using a photoelectric recording Fabry-Perot spectrometer and enriched isotopes ^{160}Dy and ^{164}Dy excited in liquid-nitrogen cooled hollow cathodes. On the basis of the present data, the

reported mixing of the configurations $4f^9 4d6s$, $4f^9 5d^2$ and $4f^{10} 6p$ have been confirmed for 27 odd levels by means of a 'sharing rule'. Isotope shifts in transitions from the high even levels of $4f^9 5d6p$ and $4f^9 6s6p$ to low odd levels of $4f^9 5d6s$ and $4f^9 6s^2$ configurations are reported for the first time. Electronic configurations have been suggested for nine unassigned odd levels. (15 refs.)

117803 Relativistic and correlation corrections to electron affinities of alkali and halogen atoms. W.Nowak, J.Karwowski, M.Klobukowski (Inst. Fizyki, Uniwersytet Mikolaja Kopernika, Torun, Poland).
Theor. Chim. Acta (Germany), vol.63, no.4, p.313-16 (1983).
Electron affinities (EAs) of alkali and halogen atoms have been calculated using Hartree-Fock and Dirac-Hartree-Fock methods. Comparing the results with the experimental values, relativistic and correlation corrections to EAs have been estimated. In the case of alkali atoms correlation correction constitute 110%-120% of the experimental EA values. In the case of halogens the corresponding numbers are 30%-60%. Relativistic effects are negligibly small for alkali atoms but significant for halogens (40% of the experimental value for At). (14 refs.)

117804 Triplet-singlet interaction in the $1s\ 2s^3S_1$ hyperfine splitting of He-like Li^+. J.Kowalski, R.Neumann, S.Noehte, H.Suhr (Phys. Inst., Univ. Heidelberg, Heidelberg, Germany), G.zu Putlitz, R.Herman.
Z. Phys. A (Germany), vol.313, no.3, p.147-50 (1983).
The hyperfine structure (hfs) interaction between the metastable 2^3S_1 and 2^1S_0 states in $^{6,7}Li^+$ causes very small equal and opposite energy level shifts, δ, in the two levels having the same total angular momentum quantum number $F=I$. This amounts to 12 ppm with respect to the total hfs splitting of 30 GHz for the $^7Li^+$ 2^3S_1 state and has been measured for the first time directly for the case of a core-free electronic system by combined laser-microwave spectroscopy. A new calculation of δ with accurate integral-transform 2^1S_0 and 2^3S_1 wave functions is reported. Configuration interactions and electron exchange and correlation effects, which differ for parallel ($^3S_1$) and antiparallel ($^1S_0$) spins, are treated in detail in order to obtain very good agreement between measured and theoretical values for this tiny perturbation. A complete understanding of δ is indispensible for extracting fundamental constants from two-electron spectroscopic data. (20 refs.)

31.30 CORRECTIONS TO ELECTRONIC STRUCTURE

117805 Magnetic susceptibility of 1,1′,2,2′-tetramethylcobaltocene and 1,1′-diethylcobaltocene: evidence for the dynamic Jahn-Teller effect. E.Konig, V.P.Desai (Inst. fur Phys. und Theoretische Chem., Univ. Erlangen-Nurnberg, Erlangen, Germany), B.Kanellakopulos, F.H.Kohler.
Chem. Phys. (Netherlands), vol.80, no.3, p.263-72 (15 Oct. 1983).
The magnetic susceptibility of 1,1′,2,2′-tetramethylcobaltocene, $Co[C_5H_3(CH_3)_2]_2$, and 1,1′-deithylcobaltocene, $Co(C_5H_4C_2H_5)_2$, has been studied between 0.99 and 296K. The data are well reproduced by a calculation of the dynamic Jahn-Teller effect for the $^2E_{1g}(a^2{}_{1g}e_{2g}{}^4e_{1g})$ ground state of D_{5d} symmetry. A suitable set of parameter values is given by $\zeta=100\ cm^{-1}$, $\delta=150\ cm^{-1}$, $k_{JT}=0.40$, $\kappa=0.70$. The magnetism of cobaltocene, $Co(C_5H_5)_2$, may be described by parameter values of comparable magnitude. The results imply a significantly larger reduction of the spin-orbit coupling parameter ζ due to covalency than of the orbital reduction factor κ. (20 refs.)

117806 Hyperfine structure splittings of the hydrogen atom in a covariant Hamiltonian formalism. T.Fujii, H.Enatsu (Dept. of Phys., Ritsumeikan Univ., Kyoto, Japan).
Mem. Res. Inst. Sci. & Eng. Ritsumeikan Univ. (Japan), no.41, p.11-20 (1982).
On the basis of a covariant Hamiltonian formalism, the nuclear correction to the hyperfine mass levels of the hydrogen atom are calculated. An approximation method in which Dirac spinors reduce to Pauli spinors, is employed. The results are compared with those obtained previously in an approximation method slightly different from the present one. (7 refs.)

117807 Relativistic calculation of the natural width of energy levels for multicharged one-electron ions. T.E.Timofeeva.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.82-4 (Aug. 1983). In Russian.
A general expression suitable for the numerical calculations of the natural width of energy levels for multicharged one-electron ions have been obtained within the framework of the adiabatic S-matrix formalism. The width of the energy level $2p_{1/2}$ has been calculated within the nonrelativistic limit. (4 refs.)

31.50 EXCITED STATES

117808 The method of delayed coincidences applied to the measurement of the lifetimes of K^+ ion excited states. M.A.Martin Vicente, J.Campos Gutierrez (Ciudad Univ., Madrid, Spain).
An. Fis. Ser. B (Spain), vol.79, no.2, p.164-70 (May-Aug. 1983). In Spanish. [received: Oct. 1983]
The first experimental values for the lifetime of K^+ levels obtained by delayed coincidence are given. The method of measurement was excitation by low energy electron pulses followed by single photon counting. The measured levels belong to the 3p5 4p configuration. (33 refs.)

117809 Contrasting picosecond photokinetics of Co^{II} and Co^{III} porphyrins verify excited-state predictions. C.D.Tait, D.Holten (Dept. of Chem., Washington Univ., St. Louis, MO, USA), M.Gouterman.
Chem. Phys. Lett. (Netherlands), vol.100, no.3, p.268-72 (9 Sept. 1983).
Using picosecond transient absorption techniques, the authors observed different low-lying excited states for several Co^{II} and Co^{III} porphyrins. These differences are interpreted in terms of theoretical calculations that predict the lowest-energy excited states to be $^2(\pi, d)$ in Co^{II} and $^3(d, d)$ in Co^{III}. (23 refs.)

117810 Resonant states of the hydrogen atom in strong magnetic fields. D.W.Noid (Oak Ridge Nat. Labs., Oak Ridge, TN, USA), S.K.Knudson, J.B.Delos.
Chem. Phys. Lett. (Netherlands), vol.100, no.4, p.367-70 (16 Sept. 1983).
Resonant states of atomic hydrogen in strong magnetic fields have been computed by semiclassical methods. Eigenvalues are obtained by using an adiabatic separation of variables and standard WKB methods; these are confirmed by semiclassical quantization of numerically quasiperiodic trajectories. Large numbers of resonant states are found at $B=10$ kT for L_z values above 20. (13 refs.)

117811 Recurrent algorithm solution of an infinite series of linear differential equations using a triangular matrix. I.M.Gaisinskii.
Zh. Vychisl. Mat. & Mat. Fiz. (USSR), vol.23, no.4, p.1003-7 (July-Aug. 1983). In Russian. English translation in: *USSR Comput. Math. & Math. Phys. (GB)*
A recurrence algorithm for calculating the coefficients of an infinite system of ordinary linear differential equations with constant coefficients with respect to a base function by a Greens function matrix expansion is constructed for the case when equality of the diagnoal elements of the original triangular matrix system is allowed. An investigation is made of the convergence of the proposed algorithm. As an example a calculation is presented of a system of kinetic equations describing the relaxation of a populated Rydberg state of a hydrogen atom for the dominant spontaneous radiation processes. 31.90 OTHER TOPICS IN THE THEORY OF ATOMS AND MOLECULES

(inc. properties other than energy)

117812 The potential energy curve from the excited state $A^1\Sigma^+$ of KH. A.Pardo, J.M.L.Poyato, M.S.Guijarro (Dept. de Quimica-Fisica y Quimica Cuantica, Univ. Autonoma de Madrid, Madrid, Spain).
An. Fis. Ser. A (Spain), vol.79, no.2, p.121-9 (May-Aug. 1983). [received: Oct. 1983]
The authors present the molecular constants revised for the $A^1\Sigma^+$ state of the KH molecule. These constants are used for the determination of the RKR potential energy curve by a new method with numerical integration. Results are in good agreement with the others' authors. (14 refs.)

117813 The hydrogen atom in a magnetic field—symmetries in the low field diamagnetic limit. J.C.Gay, D.Delande (Lab. de Spectroscopie Hertzienne, d'Ecole Normale Superieure, Paris, France).
Comments At. & Mol. Phys. (GB), vol.13, no.6, p.275-97 (1983).
Surprisingly, understanding the magnetism of the atom is still a major problem of contemporary physics. The basic aspects of the paramagnetic interaction responsible for the Zeeman effect have been understood since the work of Lorentz, but not the diamagnetic part of the magnetic interaction, which from Maxwell's equations is as essential as the paramagnetic part. The diamagnetic interaction may be responsible for a complete alteration of atomic properties, changing the Coulomb signature of the spectrum to a Landau one. There have been major advances in this field over the last few years. The authors review those in the low field Coulomb limit which turn out to be major pieces of the puzzle. Classical mechanics and group theoretical methods play an important role. At present they allow a complete understanding of the diamagnetic regime at low fields, although they are yet far from a general solution for the whole problem. (36 refs.)

117814 Effective core potential calculations using frozen orbitals. Applications to transition metals. L.G.M.Pettersson (Inst. of Theoretical Phys., Univ. of Stockholm, Stockholm, Sweden), U.Wahlgren, O.Gropen.
Chem. Phys. (Netherlands), vol.80, no.1-2, p.7-16 (Oct. 1983).
The effective core potential (ECP) method is modified to include frozen orbitals in order to improve the description of the outer core-valence interactions. Applications are made to the Sc, Ni and Pd atoms and several compounds containing these. It is shown that the new ECP resolves the earlier problems concerning the bond distance in $ScO(^2\Sigma^+)$ and the rotational barrier in $[NiH_4]^{2-}$. At the MC and CI levels the $^2\Delta$ and $^2\Pi$ states of NiH are accurately described using the new type of ECP. (27 refs.)

117815 Potential surfaces derived from gradient calculations—new potentials for Li^+/H_2O, Na^+/H_2O and K^+/H_2O. D.G.Bounds, P.J.Bounds (IBM Dept., Poughkeepsie, NY, USA).
Mol. Phys. (GB), vol.50, no.1, p.25-32 (Sept. 1983).
It is shown how simple ion-water potentials may be derived from a small number of calculations of energy derivatives without recourse to multiparameter fitting. The method is tested against athe SCF data for Li^+/H_2O, Na^+/H_2O and K^+/H_2O due to Kistenmacher, Popkie and Clementi (1972, 1973) and also against the more extensive Na^+/H_2O data of Dacre. New four-centre potentials are proposed for Li^+/H_2O, Na^+/H_2O and K^+/H_2O. (17 refs.)

117816 Hyperspherical representations of triatomic energy surfaces. M.Mishra, J.Linderberg (Dept. of Chem., Aarhus Univ., Aarhus, Denmark).
Mol. Phys. (GB), vol.50, no.1, p.91-6 (Sept. 1983).
Examples of triatomic electronic energy surfaces are presented in terms of hyperspherical coordinates using a mapping introduced by Mead (1980). An approximate electronic ground state energy is determined from the Hubbard model for the H_3 system and graphs are prepared for different values of the hyperspherical radius. (16 refs.)

32.00 ATOMIC SPECTRA AND INTERACTIONS WITH PHOTONS

32.20 ATOMIC SPECTRA GROUPED BY WAVELENGTH RANGES

117817 On the role of the dynamic Jahn-Teller effect in the spectra of matrix-isolated atoms with strong spin-orbit coupling. C.M.Weinert, F.Forstmann (Inst. fur Theoretische Phys., Freie Univ. Berlin, Berlin, Germany), R.Grinter, D.M.Kolb.
Chem. Phys. (Netherlands), vol.80, no.1-2, p.95-111 (Oct. 1983).
The extra splitting of the $S_{1/2}\rightarrow P_{3/2}$ absorption band of matrix-isolated atoms is investigated. The question is raised whether this splitting of the band has its origin in a static axial crystal field or in the coupling of low-symmetry modes of the matrix to the optical transition. Several theoretical and experimental ways of answering this question are discussed. A method of proving the existence of a dynamic Jahn-Teller effect is proposed. It consists of an analysis of the MCD absorption lineshapes up to the third moment. In this proof the authors take advantage of the fact that for strong spin-orbit splitting the parameters appearing in the moments' evaluation are not dependent on the spin-orbit parameter but only on the electron-lattice interaction. For this purpose, a new evaluation of the MCD moments' formulas is performed for strong spin-orbit systems and electron-lattice coupling up to second order in the lattice coordinates. (23 refs.)

117818 Effect of metastable states on the emission lines of OIII, OIV and OV ions. T.Kato (Inst. of Plasma Phys., Nagoya Univ., Nagoya, Japan), K.Masai, J.Mizuno.
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3019-28 (Sept. 1983).
Oxygen ions such as OIII, OIV, OV and OVII have metastable states, for example $2s2p^3(^5S)$, $2s2p^2(^4P)$, $2s2p(^3P)$ and $1s2p(^3P)$. When the electron density is high ($n_e<10^{10}$ cm^{-3}), the population densities of metastable states also become high, and the intensities of emission lines and the populations of ionization states are affected by the collisions with electrons. The authors have studied the density dependence of the line emissions and ionization balance including the populated metastable states. They apply these results to the diagnostics of plasmas.

117819 Electron collisional rate coefficients for low-level transitions in hydrogen. S.A.Drake (Joint Inst. for Lab. Astrophys., Univ. of Colorado, Boulder, CO, USA).
Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.15p-19p (Oct. 1983).
Aggarwal (1983) has presented new calculations of the excitation rate coefficients due to electron impact of the $n=1$ to $n'=2$ and $n=1$ to $n'=3$ transitions in atomic hydrogen, and compared them with the semi-empirical rates of Johnson (1972); he has found that the latter calculation can be as much as a factor of 9 too large compared to his new results at temperatures of 5×10^3K. In fact, Aggarwal has miscalculated the Johnson rates, and their actual values are much closer to his new values than he concluded; for the $1\rightarrow2$ transition, the agreement is within 10 per cent for temperatures between 5×10^3K and 3×10^5K, while for the $1\rightarrow3$ transition, the Johnson rate is a factor of 2 too small at low temperatures and 25 per cent too small at the higher temperatures. Thus, it is not possible to make any general statement that the Johnson rates always tend to be overestimates of the correct rates, particularly at low temperatures. (12 refs.)

117820 Magnetic resonance of cesium atoms in the case of optical pumping by radiation from a single-mode injection laser. L.S.Kornienko, A.L.Kotkin, V.I.Malakhova, V.V.Maiorshin, R.M.Umarkhodzhaev, S.D.Yakubovich (Sci.-Res. Inst. of Nuclear Phys., M.V. Lomonosov State Univ., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.380-2 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.631-3 (March 1983). [received: Oct. 1983]
An investigation was made of the influence of single-mode radiation from an injection laser on the magnetic resonance signal as a function of the laser radiation frequency. It was found that the amplitude, phase, and rate of decay of the free precession signal depended on the tuning of the laser radiation frequency within the Doppler profile of the line representing the hyperfine levels of the ground state of cesium. 117821 Branching ratios in the vacuum ultraviolet spectrum of neutral carbon. G.P.Tozzi (Osservatorio Astrofisico di Arcetri, Firenze, Italy), M.C.E.Huber, U.Pauls.
Astron. & Astrophys. (Germany), vol.126, no.2, pt.1, p.320-4 (Oct. 1983).
The relative strengths of allowed and intercombination transitions out of the $3s^3P^0$, $2p^3\ ^3P^0$ and $^3D^0$, $3d^3P^0$ and $^3D^0$ as well as $4s^3P^0$ terms belonging to neutral carbon have been measured. Some of the allowed multiplets exhibit deviations from *LS*-coupling. Implications of the measurements regarding the

spectra of the interstellar medium of comets and chromospheres are mentioned. (28 refs.)

117822 On the scaling properties of the energy spectrum of hydrogen in a uniform magnetic field. H.Hasegawa, S.Adachi, H.Harada (Dept. of Phys., Kyoto Univ., Kyoto, Japan).
J. Phys. A (GB), vol.16, no.14, p.L503-9 (1 Oct. 1983).
The magnetic-field scaling relation between the coordinates, momenta and the energy in the Hamiltonian for the Kepler motion in a uniform magnetic field, i.e. $H(\gamma^{-1/3}p, \gamma^{2/3}r; \gamma^{1/3}m, \gamma=1)=\gamma^{-2/3}H(p,r; m, \gamma)$, where $\gamma=B/B_0$ is the normalised field strength and m the constant value of the angular moment,um B-parallel component is shown to ensure a representation of the semiclassical energy spectrum: $E=(n+{}^1/_2)^{-2}f(\gamma^{1/3}(n+{}^1/_2), \gamma^{1/3}m)$, $m=0, \pm1, \ldots; n=0, 1, \ldots$. The authors discuss how the function f, in the two-dimensional approximation ($z=p_z=0, z//B$), can be constructed. (18 refs.)

117823 Observation of Na I inner shell-excited quartet terms. R.Frohling (Inst. fur Atom- und Festkorperphys. Freien, Univ. Berlin, Berlin, Germany), H.J.Andra.
Phys. Lett. A (Netherlands), vol.97A, no.9, p.375-6 (26 Sept. 1983).
Stokes parameters for Na I spectral lines after ion-beam surface interaction at grazing incidence were measured. The as yet unidentified line at 507.1 nm showed opposite polarization to that normally found in such experiments. Measurements after ion-atom collisions with charge state separation indicate that this line is a member of the neutral Na I-spectrum. Together with an unpublished calculation by Weiss of inner shell-excited term energies of Na atoms the analysis of the polarization suggests the line to stem from a transition inner shell-excited between the terms $3s3p^4D_{7/2}$-$3s4s^4P_{5/2}$ of neutral sodium. 32.20R X-ray spectra

117824 Kα hypersatellites of Zr. S.I.Salem, A.Kumar (Dept. of Phys. & Astron., California State Univ., Long Beach, CA, USA).
Phys. Rev. A (USA), vol.28, no.4, p.2245-7 (Oct. 1983).
The $K\alpha$ hypersatellites $K\alpha_1{}^h$ and $K\alpha_2{}^h$ of zirconium were observed in a conventional X-ray spectrum analysis. The energy separation between the hypersatellites and their corresponding diagram lines were measured, and the intensity ratio $I(K\alpha_1{}^h)/I(K\alpha_2{}^h)$ was computed. The experimental values are in good agreement with the results of the most advanced calculations, except for the energy of the $K\alpha_2{}^h$ where the measured value is some 15 eV higher than the theoretical prediction. (inc. quenching)

117825 Theoretical determination of fine-structure transitions occurring in collisional redistribution of light. K.C.Kulander, F.Rebentrost (Max-Planck-Inst. fur Quantentoptik, Garching, Germany).
Phys. Rev. Lett. (USA), vol.51, no.14, p.1262-4 (3 Oct. 1983).
Recent experimental results of Havey, Copeland, and Wang (1983) on the collisional redistribution of light by Na in Ar showed a dependence of the relative intensities of the Na D_1 and D_2 resonance lines on laser detuning. Calculations of these intensity ratios are reported. The agreement between theory and experiment obtained shows the importance of fine-structure transitions occurring during the dissociation of the excited-state molecule. (12 refs.)

117826 Subnatural-linewidth laser spectroscopy by phase switching. F.Shimizu (Dept. of Appl. Phys., Univ. of Tokyo, Tokyo, Japan), K.Shimizu, H.Takuma.
Phys. Rev. A (USA), vol.28, no.4, p.2248-53 (Oct. 1983).
A method to obtain subnatural resolution in laser-induced fluorescence spectroscopy by phase switching is described. The subnatural linewidth is obtained by extracting a coherent transient response induced by the switching of the laser. The linewidth in this type of spectroscopy is determined by the time interval between the switching and observation, instead of the spontaneous lifetime. The result is compared with the experiment on the Na D_1 line. (39 refs.)

32.60 ZEEMAN AND STARK EFFECTS

117827 The electric dipole moment of the fluorocarbene radical, HCF, in its $\tilde{X}^1A'$ and $A^{\sim1}A''$ electronic states. R.N.Dixon, N.G.Wright (School of Chem., Univ. of Bristol, Bristol, England).
Chem. Phys. Lett. (Netherlands), vol.100, no.4, p.311-15 (16 Sept. 1983).
Stark shifts have been measured for a number of transitions in the origin band of the $A^{\sim1}A''$-$X^{\sim1}A'$ electronic transition in HCF, using Doppler-limited optical Stark spectroscopy. The transitions were observed in DC field of up to ≈20 kV/cm, and excited by a single-mode tunable dye laser. From the resolved M_J structure the following values for the a-axis components of the electric dipole moment were computed: $\mu_a''=0.061\pm0.005$ D, $\mu_a'=0.488\pm0.005$ D. These values are discussed and rationalised in terms of a simple model. The other component of the electric dipole moment, μ_b is also discussed though no measurements have been made upon it. (17 refs.)

117828 Influence of different collisional processes on the Stark broadening. M.S.Dimitrijevic, N.Feautrier, S.Sahal-Brechot (Obs. de Paris, Meudon, France).
Fizika (Yugoslavia), vol.15, no.3, p.205-12 (July-Sept. 1983).
Using a semiclassical formalism, elastic, inelastic and strong collision's contributions to the electron impact width of the Li I ($2s^2$ S-$2p^2$ P^0; $\lambda=670.78$ nm) resonance line have been computed for different angular momenta of the incoming perturbing electron and for $T=2500$, 10000 and 20000K. On the basis of the obtained results, the relative importance of elastic, inelastic and strong collision's contributions to the line width are discussed. (6 refs.)

117829 Stark broadening of lines from multiply-charged carbon ions in a high-density arc plasma. M.A.El-Farra, T.P.Hughes (Dept. of Phys., Univ. of Essex, Colchester, England).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.30, no.4, p.335-43 (Oct. 1983).
Profiles of C(III) and C(IV) lines emitted in the VUV and visible regions from a pulsed arc ($N_e=1.5\times10^{18}$ cm^{-3}, $T_e=5.3\times10^4$K) have been measured with time resolution. The experimental results are in satisfactory agreement with the predictions of electron impact theory for (3-3) and (3-4) transitions for which the energy separation between the upper level and the nearest perturbing level is smaller than the electron thermal energy. For lines from (2-2) transitions for which the plasma is optically thick, damping constants determined experimentally agree with theoretical values within a factor of two. (12 refs.)

117830 Stark broadening of the Paschen-beta line of hydrogen in a linear discharge. R.Castell, D.Mandelbaum, A.Mendez, A.Sanchez (Dept. de Fisica, Univ. Simon Bolivar, Caracas, Venezuela).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.30, no.4, p.345-9 (Oct. 1983).
Experimental profiles of the hydrogen Paschen-beta line have been measured in a helium plasma with 0.85% hydrogen. Electron densities were deduced from profiles of the He(I) line ($\lambda=4471.5$ Å) and are in the range 10^{14}-10^{15} cm^{-3}. The authors measurements are compared with theoretical calculations. (8 refs.)

117831 Stark effect in barium $6snd$ $^1D_2$ Rydberg states; evidence of strong perturbations in the $^1F_3$ series. K.A.H.van Leeuwen, W.Hogervorst, B.H.Post (Natuurkundig Lab., Vrije Univ., Amsterdam, Netherlands).
Phys. Rev. A (USA), vol.28, no.4, p.1901-7 (Oct. 1983).
The scalar and tensor polarizabilities of the barium $6snd$ $^1D_2$ states with principal quantum number n ranging from 14 to 30, as well as those of the $5d7d$ $^1D_2$ perturber state near $n=26$, have been measured with high-resolution laser-atomic-beam spectroscopy. The data are analyzed by calculating the contribution to the polarizabilities of all known odd-parity states connected via the electric dipole operator with the $^1D_2$ states. In this way the contributions of the unknown $6snf$ $^1F_3$ states are inferred. The results indicate that the $^1F_3$ series is heavily affected by at least two perturber states. A tentative three-channel quantum-defect-theory analysis of the $^1F_3$ series, based on a fit to the experimental polarizabilities, is presented. (30 refs.)

117832 Stark widths and shifts of singly ionized silicon spectral lines. A.Lesage (Obs. de Paris, CNRS, Meudon, France), B.A.Rathore, I.S.Lakicevic, J.Puric.
Phys. Rev. A (USA), vol.28, no.4, p.2264-8 (Oct. 1983).
Stark widths and shifts of Si II lines from five visible multiplets: (1) $3p^2$ ^2D-$4p$ $^2P^0$, (2) $4s$ ^2S-$4p$ $^2P^0$, (3) $3d$ ^2D-$4f$ $^2F^0$, (4) $4p$ $^2P^0$-$5s$ ^2S, and (5) $4p$ $^2P^0$-$4d$ ^2D, are measured in an electromagnetically driven T tube. Electron density [$(0.3$-$1.4)\times10^{17}$ cm^{-3}] is determined by laser interferometry, and from Hβ profiles. Temperature (16000-22000K) is obtained from the intensity ratios of Si III and Si II lines, and from Boltzmann slopes of Ne I lines. Results are compared with other experimental and theoretical data. (34 refs.)

117833 Tensor hyperpolarizability of the $6s19d$ $^1D_2$ barium Rydberg state. P.Kulina, R.-H.Rinkleff (Inst. fur Atom- und Molekulphys., Univ. Hannover, Hannover, Germany).
Z. Phys. A (Germany), vol.313, no.3, p.241-2 (1983).
Tensor polarizability and tensor hyperpolarizability of the 6s19d $^1D_2$ Rydberg state of barium were derived from Stark splittings measured by quantum beat spectroscopy. The hyperpolarizability appearing in the fourth order contribution of the perturbation expansion was expressed in spherical tensor form. Using the Coulomb aproximation numerical values were calculated which are in fair agreement with experimental results. (4 refs.)

32.70 SPECTRAL LINE SHAPES AND INTENSITIES

117834 Information theory of line-shape in collision-induced absorption. Z.Gburski, C.G.Gray, D.E.Sullivan (Dept. of Phys., Univ. of Guelph, Guelph, Ontario, Canada).
Chem. Phys. Lett. (Netherlands), vol.100, no.4, p.383-6 (16 Sept. 1983).
Information theory is used to interpret the line-shape of collision-induced absorption spectra of rare-gas mixtures. Numerical results and comparison with experiment are given for low-density Xe-Ar gas mixtures at 295K. (15 refs.)

117835 Isotopic shift measurement of the $^3P_1$-$^3P_0$ fine structure transition of ^{24}Mg and ^{26}Mg. E.Bava, A.De Marchi, A.Godone, G.D.Rovera (Istituto Elettrotecnico Nazionale, Galileo Ferraris, Turin, Italy), G.Giusfredi.
Opt. Commun. (Netherlands), vol.47, no.3, p.193-5 (1 Sept. 1983).
The isotopic frequency shift for the $^3P_1$-$^3P_0$ $\Delta m_j=0$ fine structure transition in the first metastable triplet of ^{24}Mg and ^{26}Mg is reported. The transitions corresponding to the two even isotopes of Mg have been observed via the fluorescence emission at 4751 Å of the intercombination line $^3P_1$-$^1S_0$ in a metastable atomic beam. The center frequencies have been measured with an uncertainty of 7×10^{-9}; the isotopic shift turned out to be 1706 ± 2 kHz. (7 refs.)

117836 Lamb shift and the lifetime of the $2^2S_{1/2}$ state of hydrogenlike argon ($Z=18$). H.Gould (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA), R.Marrus.
Phys. Rev. A (USA), vol.28, no.4, p.2001-25 (Oct. 1983).
The authors report a measurement of the Lamb shift in hydrogenlike argon based on the electric-field-quenching method, and a measurement of the unperturbed lifetime of the $2^2S_{1/2}$ state. They find the lifetime of the unperturbed $2^2S_{1/2}$ state to be 3.487(0.036) ns in agreement with the theoretical value of 3.496 ns. This is the first measurement of the $2^2S_{1/2}$ state lifetime of sufficient accuracy to observe the contribution to the total decay rate of the single-photon magnetic dipole decay. The authors' measured value of the

Lamb shift is $\delta E(2^2S_{1/2}\text{-}2^2P_{1/2})=37.89(0.38)$ THz, lower than, but in agreement with, Mohr's value of 38.25(0.025) THz, and 2.7 standard deviations below Erickson's value of 39.01(0.16) THz. Both the quenched and natural lifetimes were measured by the beam-foil time-of-flight technique. In this paper the authors emphasize the treatment of the systematic effects in the beam-foil time-of-flight method including cascades from higher excited states, interference from the spectra of heliumlike ions, collisions in the residual gas, and perturbations from a highly excited extra electron, as well as systematic effects more unique to electric field quenching. (90 refs.)

117837 Isotope shifts of energy levels in the naturally abundant isotopes of strontium and calcium. C.-J.Lorenzen, K.Niemax (Inst. fur Experimentalphys., Univ. Kiel, Kiel, Germany), L.R.Pendrill.
Phys. Rev. A (USA), vol.28, no.4, p.2051-8 (Oct. 1983).
The isotope shifts of long series of spectral lines in the optical spectra of the alkaline earth elements Ca and Sr have been measured by Doppler-free, two-photon laser spectroscopy with a thermionic diode. The variation of transition isotope shifts with transition energy yields the level isotope shifts with reference to the ionization limit and how these shifts vary with the binding energy of the optically active electron. The largest isotope shifts of levels in these elements appear to arise from the specific-mass effect in the presence of state mixing. (20 refs.)

117838 Rb and Cs broadening of the Na resonance lines. B.Kamke, W.Kamke, K.Niemax, A.Gallagher (Joint Inst. for Lab. Astrophys., NBS & Univ. of Colorado, Boulder, CO, USA).
Phys. Rev. A (USA), vol.28, no.4, p.2254-63 (Oct. 1983).
The broadening of the Na resonance lines, due to collisions with Rb and with Cs, has been measured with the use of the normalized fluorescence-intensity method of Chatham, Lewis, and Gallagher (1980). Several Na resonance-radiation diffusion and absorption corrections were necessary in the Rb case, due to an unavoidable excess of Na density in the Rb vapor. The line-broadening rate coefficients k_1 and k_2 for the D_1 and D_2 resonance lines are $k_1(\text{Rb})=(6.2\pm0.4)\times10^{-9}$ cm^3 s^{-1}, $k_2(\text{Rb})=(5.5\pm0.6)\times10^{-9}$ cm^3 s^{-1}, $k_1(\text{Cs})=(6.9\pm1.0)\times10^{-9}$ cm^3 s^{-1}, and $k_2(\text{Cs})=(5.5\pm0.9)\times10^{-9}$ cm^3 s^{-1} at $T\simeq300$°C. The leading (C_6R^{-6}) dipole-dipole long-range dispersion forces for the Na-Rb and Na-Cs interactions are calculated, and are used in the impact-theory formula to obtain theoretical line-broadening rate coefficients. These are in poor agreement with the measurements, indicating that as suggested by Vadla, the higher-order (C_8R^{-8}) dispersion terms are also important at the very long range responsible for this line broadening. (18 refs.)

117839 Natural radiative lifetimes in the $^2S_{1/2}$ and $^2D_{5/2,3/2}$ sequences of aluminum. G.Jonsson, H.Lundberg (Dept. of Phys., Lund Inst. of Technol., Lund, Sweden).
Z. Phys. A (Germany), vol.313, no.3, p.151-4 (1983).
Natural radiative lifetimes have been measured for the $3s^2ns$ $^2S_{1/2}$ ($n\leq10$) and $3s^2$nd $^2D_{5/2,3/2}$ ($n\leq11$) sequences of aluminum using pulsed laser excitation of an atomic beam. The investigated states were populated from the ground configuration using UV pulses of wavelength down to 210 nm produced by a Nd:YAG-or an excimer-pumped dye-laser system. The S-state lifetimes increase regularly with increasing principal quantum number but this is not the case for the D sequence. (9 refs.)

32.80D Autoionization

117840 Resonance and intermediate-coupling effects in electron scattering with highly charged ions. II. Autoionization and dielectronic recombination. A.K.Pradhan (Dept. of Phys., Univ. of Windsor, Windsor, Ontario, Canada).
Phys. Rev. A (USA), vol.28, no.4, p.2128-36 (Oct. 1983).
For pt.I see ibid., vol.28, no.4, p.2113 (1983). The role of resonances in electron-impact excitation of highly charged ions is examined and some methods are described in order to take account of autoionization and dielectronic recombination. The intermediate-coupling calculations of paper I (1983) are extended to include these processes and effective collision strengths are obtained. Results are presented to illustrate particular features in a number of transitions in Fe^{24+} and Mo^{40+}. Resonance analysis is carried out employing numerical interpolation techniques and multichannel quantum-defect theory, employing reactance matrices in nine-state close-coupling and distorted-wave approximations. It is shown that all three effects considered in the present study, departure from LS coupling, resonance enhancement due to autoionization, and reduction in autoionization enhancement due to dielectronic recombinations, can be of considerable importance in the cross sections of highly ionized systems. In the high-Z ions of the helium isoelectronic sequence the contribution of autoionizing resonances remains large even after all probable radiative channels are included, although the net autoionization effect decreases with Z. (13 refs.)

117841 Laser-induced autoionization in the presence of radiative damping and transverse relaxation. J.W.Haus, M.Lewenstein (Fachbereich Phys., Univ. Essen, Essen, Germany), K.Rzazewski.
Phys. Rev. A (USA), vol.28, no.4, p.2269-81 (Oct. 1983).
A model for laser-induced autoionization is considered which includes two qualitatively different relaxation mechanisms: radiation damping to the ground state and phase fluctuations. Analytic solutions are presented for the first- and second-moment correlation functions of the atomic and photon operators in the Heisenberg picture. The authors present an explicit analysis of the spectrum of emitted photons at long times and investigate the effect of both relaxation mechanisms, as well as the influence of detuning and laser intensity, on this photoemission spectrum. (19 refs.)

Atomic photoionization in a strong magnetic field .... See Entry 117846

32.80F Photoionization and photodetachment

117842 Theoretical study of shake-up in the core photoelectron spectra of the alkali atoms. G.De Alti, P.Decleava, A.Lisini (Istituto di Chimica, Univ. di Trieste, Trieste, Italy).
Chem. Phys. (Netherlands), vol.80, no.3, p.229-35 (15 Oct. 1983).
Relativistic and nonrelativistic Hartree-Fock calculations have been performed for the shake-up lines relative to core ionization of the alkali atoms. Good general agreement with the experimental data is achieved both for the energy and the intensity. Relativistic effects are small, amounting to $\approx$0.2 eV in Cs. As concerns the shake-up energies, a correlation effect is detected, the magnitude of which increases along the series. (44 refs.)

117843 Secondary ionisation processes in laser-induced cascade ionisation. Y.E.Gamal, M.A.Harith (Dept. of Phys., Cairo Univ., Giza, Egypt).
J. Phys. D (GB), vol.16, no.10, p.1901-6 (14 Oct. 1983).
The effects of the two-step ionisation and photoionisation from excited states of helium and argon gases are studied using a more realistic theoretical model for cascade ionisation. Two sets of experimental data were investigated, covering the wavelength range 720-840 nm with laser light pulse duration 18 ns and 40 ns at two different pressures, 760 Torr and 1.064×10^4 Torr. These investigations show the importance of the photoionisation of excited atoms at atmospheric pressure, while at higher pressure the collisional ionisation processes dominate. (8 refs.)

117844 ^{2}P photoionization cross section of Sb I. M.Mazzoni (Istituto di Astron., Florence, Italy).
Phys. Lett. A (Netherlands), vol.97A, no.9, p.381-3 (26 Sept. 1983).
A very wide absorption feature has been observed in the atomic spectrum of neutral antimony, appearing at about 196 nm. It has been identified as the continuous absorption due to bound-free transitions from the ^{2}P term of the ground configuration. (9 refs.)

117845 Angular distributions and quantum beats of photoelectrons from resonant two-photon ionization of lithium. Ring-lin Chien, O.C.Mullins, R.S.Berry (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA).
Phys. Rev. A (USA), vol.28, no.4, p.2078-84 (Oct. 1983).
Angular distributions of photoelectrons from resonant two-photon ionization via the $2p$ $^2P_{1/2}$ or $2p$ $^2P_{3/2}$ state of lithium have been measured. The quantum beats of hyperfine levels strongly affect the angular distribution. Three microscopic parameters are extracted: the ratio of the radial matrix elements from $2p$ excited states to $l=0$ and 2 final states, the difference of the phase shifts of the continuum electrons in final channels, and a time-dependent parameter for hyperfine interaction. The experimental results agree with theoretical quantum-defect calculation and extrapolated bound-state data. (15 refs.)

117846 Atomic photoionization in a strong magnetic field. C.H.Greene (Dept. of Phys. & Astron., Louisiana State Univ., Baton Rouge, LA, USA).
Phys. Rev. A (USA), vol.28, no.4, p.2209-16 (Oct. 1983).
The photoionization of hydrogen atoms in a strong magnetic field is formulated as a multichannel problem by representing the asymptotic electron wave function in cylindrical coordinates. Departures from cylindrical symmetry close to the nucleus are incorporated by an R-matrix treatment at short range, which then merges with standard quantum-defect procedures. The R-matrix calculation utilizes the eigenchannel approach, recast in noniterative form. At the field strength treated $B=4.7\times10^9$ G, the photoionization cross section displays narrow 'autoionizing' resonances near the excited Landau thresholds. (37 refs.)

32.80K Multiphoton processes

117847 Continuous wave (CW) Doppler free two-photon frequency modulated (FM) spectroscopy. W.Zapka, M.D.Levenson, G.C.Bjorklund, A.C.Tam, F.M.Schellenberg (IBM Res. Lab., San Jose, CA, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.352-6 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Doppler-free two-photon absorption and two-photon dispersion spectra of Rb^{87} have been taken by FM spectroscopy. Sensitivity achieved is comparable to fluorescence detection. The technique can be readily applied where fluorescence is difficult to detect. (15 refs.)

117848 Atoms in circularly polarised fields: the dilation-analytic approach. A.Tip (Fom-Inst. for Atomic & Molecular Phys., Amsterdam, Netherlands).
J. Phys. A (GB), vol.16, no.14, p.3237-59 (1 Oct. 1983).
The time-evolution operator associated with an atom in a circularly polarised radiation field can be factorised as $U(t)=\exp[-i\omega J_3 t]\exp[-iHt]$, where J_3 is the component of the total angular momentum orthogonal to the two field components and H can explicitly be given in terms of the atomic Hamiltonian. The author establishes for a one-electron model the self-adjointness of H and in addition he develops a complex dilation theory for this operator. The purpose of this approach is to obtain an analytic continuation theory for multiphoton processes so that the imaginary parts of the complex eigenvalues of the complex dilated Hamiltonian $H(\zeta)$ can be related to the various rate constants that govern such processes. (40 refs.)

Angular distributions and quantum beats of photoelectrons from resonant two-photon ionization of lithium ...... See Entry 117845

32.90 OTHER TOPICS IN ATOMIC SPECTRA AND INTERACTIONS WITH PHOTONS

117849 Exact solution for spontaneous emission in the presence of N atoms. F.W.Cummings, Ali Dorri (Dept. of Phys., Univ. of California, Riverside, CA, USA).
Phys. Rev. A (USA), vol.28, no.4, p.2282-5 (Oct. 1983).
N two-level 'atoms' are considered in interaction with a single-mode resonant electromagnetic field. The exact solution is given nonrelativistically for all times for the case of spontaneous emission, when only one atom is initially excited. The solution is given for the general case of the N atoms in inequivalent mode positions. (7 refs.)

33.00 MOLECULAR SPECTRA AND INTERACTIONS WITH PHOTONS

33.10 CALCULATION OF MOLECULAR SPECTRA

117850 Electric field gradient and force constant in nitriles. Y.Aray (Centro de Quimica, Inst. Venezolano de Investigaciones Cientificas, Caracas, Venezuela), J.Murgich.
THEOCHEM (Netherlands), vol.13, no.1-2, p.23-35 (Sept. 1983).
The relationship between the principal component of the electric field gradient (eq_N) and the stretching force constant (k_{CN}) obtained by Salem for diatomic molecules is extended to polyatomic molecules with linear fragments of type R-C-N. It is found that for nitriles there is a linear correlation between k_{CN} and eq_N values, as predicted by theory, and that such correlation depends on the degree of conjugation between R and CN orbitals. (31 refs.)

117851 Vibrational spectra of some N-methyl-halogenotriazoles-1,2,4. M.S.Idrissi, M.Senechal (Lab. de Spectroscopie Infrarouge, Faculte des Sci., Rabat, Maroc), H.Sauvaitre, C.Garrigou-Lagrange.
Can. J. Chem. (Canada), vol.61, no.9, p.2133-6 (Sept. 1983). In French.
Vibrational spectra of some *N*-methyl chloro and *N*-methyl bromotriazoles-1,2,4 are reported. An assignment of the normal modes is proposed. This study was done in order to find new elements to solve the problem of tautomerism in *C*-substituted triazoles-1,2,4. (17 refs.)

117852 HCl vibrational distribution in the dissociation of vinyl chloride activated by flash photolysis of 3-chloro-3-methyldiazirine. R.Becerra, M.Catillejo, J.M.Figuera, M.Martin (Inst. de Quimica Fisica 'Rocasolana', Madrid, Spain).
Chem. Phys. Lett. (Netherlands), vol.100, no.4, p.340-4 (16 Sept. 1983).
HCl vibrational state populations produced in the dissociation of vinyl chloride activated by flash photolysis of 3-chloro-3-methyldiazirine were measured in an oscillator amplifier chemical laser arrangement. HCl populations can be characterized by a linear surprisal plot of slope $\lambda_v=-5.5$. (22 refs.)

117853 Vibrational analysis of SiH_2F_2 and SiD_2F_2. A.Natarajan, S.Rajendran (Dept. of Phys., Bharathidasan Univ., Tamilnadu, India).
Can. J. Spectrosc. (Canada), vol.28, no.3, p.95-9 (1983).
The potential energy constants of SiH_2F_2 and SiD_2F_2 have been evaluated on the basis of a general valence force field. The mean amplitudes of vibration, the generalized mean-square amplitudes of vibration, shrinkage constants, Coriolis coupling constants and rotation distortion constants have also been computed and are presented. (16 refs.)

117854 Rotational perturbations in the $CN(B^2\Sigma^+-X^2\Sigma^+)$ tail band system. I. Analysis of the $v=27$ and 30 levels of $CN(A^2\Pi_i)$. Y.Ozaki, T.Nagata, K.Suzuki, T.Kondow, K.Kuchitsu (Dept. of Chem., Univ. of Tokyo, Tokyo, Japan).
Chem. Phys. (Netherlands), vol.80, no.1-2, p.73-84 (Oct. 1983).
The perturbed rotational lines observed in the $CN(B^2\Sigma^+-X^2\Sigma^+)$ 12-12 and 14-14 bands are assigned. The vibrational levels, the rotational constants, and the spin-orbit interaction constants of the perturbing states, $CN(A^2\Pi_i)$ $v=27$ and 30, are determined. An RKR potential for the $CN(A^2\Pi_i)$ state is obtained up to $v=30$, and an approximate RKR potential is estimated by extrapolation up to the dissociation limit, $v=61$. The electronic terms of the perturbation constants between the $CN(A^2\Pi_i)$ and $CN(B^2\Sigma^+)$ states $H_{el}{}^{RE}$, are determined for $(v_A, v_B)=(24, 10), (27, 12)$ and $(30, 14)$. These constants are found to be nearly equal to the corresponding constants governing the interaction between the $N_2{}^+(A^2\Pi_u)$ and $N_2{}^+(B^2\Sigma_u{}^+)$ states. (32 refs.)

117855 X-ray and theoretical analysis of the relationship between substituent steric effects and the structure of bicyclo[1.1.0]butane. The unexpected flexibility of the bicylco[1.1.0]butane skeleton. P.G.Gassman, M.L.Greenlee, D.A.Dixon, S.Richtsmeier, J.Z.Gougoutas (Dept. of Chem., Univ. of Minnesota, Minneapolis, MN, USA).
J. Am. Chem. Soc. (USA), vol.105, no.18, p.5865-74 (7 Sept. 1983).
Single-crystal X-ray analyses have been run for the three possible stereoisomers of 1,3-diphenyl-2,4-bis(meth-oxycarbonyl)bicyclo[1.1.0]butane. The endo-endo, exo-endo, and exo-exo diester interflap angles were 127.2°, 121.2°, and 113.4°, respectively, which showed surprising flexibility in the bicyclo[1.1.0]butane skeleton. As the interflap angle decreased, the C1-C3 bond lengths shortened (1.558, 1.498, and 1.455 Å, respectively). The brigehead phenyl groups moved closer together as the interflap angle increased. This counter-intuitive movement of the bridgehead substituents necessitated that a least-motion discontinuity was required for any process involving flap inversion of the bicyclo[1.1.0]butane skeleton, a theoretical study of the relationship between the interflap angle and the other bonding parameters was carried out for bicyclo[1.1.0]butane with both fully optimized HF-SCF and a generalized valence bond (GVB) approach in the PRDDO approximation. These calculations covered the range of interflap angles from 99° to 180° (planar bicyclo[1.1.0]butane). Our calculations corroborate the experimentally determined structural relationships and extend beyond what is experimentally determined. Discontinuity occurred at interflap angle of 150±2°, where the bridgehead substituents ceased their inward migration and subsequently moved outward as the interflap angle proceeded from 150° to 180°. At an interflap angle of 180° the molecule lacked D_{2h} symmetry with the bridgehead hydrogens being out of the four-carbon plane by approximately 30°. The inversion barrier for a shift of these bridgehead hydrogens from one side of the four-carbon plane to the other side was calculated to be 4 kcal/mol. (29 refs.)

117856 Comment on 'Nonadiabatic treatment of the intensity distribution in the *V-N* bands of ethylene'. R.McDiarmid (Lab. of Chem. Phys., Nat. Inst. of Arthritis, Diabetes & Digestive & Kidney Diseases, Nat. Inst. of Health, Bethesda, MD, USA).
J. Chem. Phys. (USA), vol.79, no.6, p.3170-1 (15 Sept. 1983).
For original paper see C. Petrongolo et al., ibid., vol.76, p.3655 (1982). In a recent theoretical investigation the intensity distribution of the vibrational subbands of the *V-N* transition of ethylene was calculated and presented. The theoretical and experimental intensities were said to be in satisfactory agreement, although a truly quantitative comparison was said not to be possible because oscillator strengths were calculated and extinction coefficients were measured. Contrary to the above assertion, the author feels it is possible to make a quantitative comparison of the experimental and theoretical intensities. (4 refs.)

117857 Rotational energy of the hydrogen molecular ion in a magnetic field. S.A.Maluendes, F.M.Fernandez, E.A.Castro (Inst. de Investigaciones Fisiquimicas Teoricas y Aplicadas, La Plata, Argentina).
Phys. Rev. A (USA), vol.28, no.4, p.2059-64 (Oct. 1983).
A general method which combines hypervirial relations with the Hellmann-Feynman theorem and perturbation theory is applied in order to calculate the rotational eigenvalues of the hydrogen molecular ion in a magnetic field. Analytical expressions as well as numerical results are presented for both low and high field strengths. (26 refs.)

117858 Intracollisional interference in the pure rotational spectrum of HD: determination of the permanent electric dipole moment. J.B.Nelson, G.C.Tabisz (Dept. of Phys., Univ. of Manitoba, Winnipeg, Manitoba, Canada).
Phys. Rev. A (USA), vol.28, no.4, p.2157-61 (Oct. 1983).
The intensity of the pure rotational absorption spectrum of gaseous HD is measured as a function of density for pure HD and HD-He and HD-Ar mixtures. The decrease in the absorption coefficient with increasing density is consistent with a destructive intracollisional interference between the transitions involving the permanent and collision-induced dipole moments. The permanent dipole moment of the molecule in its ground vibrational state is found to be J dependent and in the range $(8-10)\times10^{-4}$ D. (31 refs.)

117859 Methylpyridines: vibrational assignments and an approximate force field. J.A.Draeger (Bartlesville Energy Technol. Center, US Dept. of Energy, Bartlesville, OK, USA).
Spectrochim. Acta Part A (GB), vol.39A, no.9, p.809-25 (1983).
Molecular vibrational analysis of pyridine and its deuterium and methyl derivatives was carried out to establish consistent vibrational assignments for use in statistical thermodynamic calculations. A 46-parameter modified valence force field was determined. The average error between the 777 observed and calculated frequencies is 7.8 cm^{-1} or 0.98%. (34 refs.)

117860 Normal coordinate treatment of liquid water and calculation of vapor pressure isotope effects. B.Gellai (Central Res. Inst. for Phys., Budapest, Hungary), W.A.Van Hook.
In *Collection of scientific papers in collaboration with joint Institute for Nuclear Research, Dubna, USSR and Central Research Institute for Physics, Budapest, Hungary. Algorithms and programs for solution of some problems in physics. Vol.IV*, p.127-58. Report KFKI-1983-21, Hungarian Acad. Sci., Budapest (1983), 191 pp.
A vibrational analysis of liquid water is reported, assuming a completely hydrogen-bonded network with continuously varying strengths of the hydrogen bonds. Frequency distribution calculations are made for intramolecular stretching and bending modes and for the intermolecular frequency region. The calculated distributions are compared with the experimental spectroscopic ones. As another test vapor pressure isotope effects are calculated from the theoretical distributions for some isotopic water molecules. Results are compared with ones of other authors obtained from a mixture model. (42 refs.)

117861 Spectroscopic study of 2-amino-4-cyano-3-phenyl-5-(p-chlorophenyl)-furane in various solvents. M.Sanchez Gomez, J.M.Guerra Perez (Facultad de Ciencias Fisicas, Univ. Complutense, Madrid, Spain).
An. Fis. Ser. B (Spain), vol.79, no.2, p.171-81 (May-Aug. 1983). In Spanish. [received: Oct. 1983]
The 2-amino-4-cyano-3-phenyl-5-(p-chlorophenyl)-furane (ACDF-2) absorption and corrected fluorescence spectra are given. The natural fluorescence lifetime and oscillator strength have been calculated. The obtained value suggest a $\pi 1 \rightarrow \pi^*$ electronic transition. The solvent influence on the oscillator strength is discussed briefly. (28 refs.)

117862 Substituent perturbation on masked ^1L_b-$^1A_1$ transition of anthracene monosulphonates: detection by photoselection in glycerol glass at 77K. S.Basu, K.K.Rohatgi-Mukherjee (Dept. of Chem., Jadavpur Univ., Calcutta, India).
Indian J. Chem. A, vol.22A, no.3, p.186-91 (March 1983). [received: Oct. 1983]
Attempts are made to detect the long axis polarized weakly absorbing ^1L_b bands in anthracene 1-sulphonate (1-AS) and anthracene 2-sulphonate (2-AS) in glycerol glass by the method of photoselection. The unpolarized fluorescence spectra and excitation (absorption) spectra are separated into two component spectra based on short and long axis polarized transition dipoles and detailed vibrational analysis is made. From a comparison of the Franck-Condon envelope it has been concluded that the vibration bands around 31746 cm^{-1} in 1-AS and 30395 cm^{-1} in 2-AS in excitation spectra are mainly due to the ^1L_b band. The perturbation of the ^1L_b band due to substitution in 1- and 2-positions of the anthracene moiety is discussed. (31 refs.)

33.20E Infrared spectra

117863 Specifications for infrared reference spectra of molecules in the vapor phase, prepared by the vapor phase subcommittee of the Coblentz Society spectral evaluation committee. P.R.Griffiths (Univ. of California, Riverside, CA, USA), A.R.H.Cole, P.L.Hanst, W.J.Lafferty, R.J.Obremski, J.H.Shaw, R.N.Jones.
Appl. Spectrosc. (USA), vol.37, no.5, p.458-63 (Sept.-Oct. 1983).
Many infrared spectrometers are now mini- and microcomputer controlled, and can readily generate data in digital form for archival storage. In order for digitally stored data to be readily transferable from one site to another, it is necessary to ensure that the format of the stored information is as uniform as possible. In the document the authors are not only proposing specifications for the measurement and presentation, as hard copy, of infrared reference spectra of molecules in the vapor phase, but also for formatting digitally stored reference data on magnetic tape. (11 refs.)

117864 Electronic and infrared spectra of iodoline. N.K.Sanyal, S.L.Srivastava, S.R.Tripathi (Dept. of Phys., Univ. of Gorakhpur, Gorakhpur, India).
Acta Phys. Pol. A (Poland), vol.A64, no.3, p.315-21 (Sept. 1983).
Electronic absorption spectrum of 2,3-dihydroindole was photographed in the region 3163-2920 Å in vapour phase. The (0, 0) band of the spectrum has been identified at 3130.9 Å (31930 cm^{-1}). All bands obtained are explained in terms of the ground state (215 cm^{-1}) and excited state (268, 423, 665, 792, 939, 1011, 1220 and 1314 cm^{-1}) fundamentals, their combinations and overtones. Fundamentals obtained are correlated with their corresponding infrared values which were recorded in the region 400-4000 cm^{-1} in liquid phase. The shift in the 0-0 band towards higher wavelength region has been attributed to cyclic or hyperconjugation. (25 refs.)

117865 The collision-induced far-infrared absorption band of gaseous methane in the region 30-900 cm^{-1}. G.Birnbaum, L.Frommhold, L.Nencini, H.Sutter (NBS, Washington, DC, USA).
Chem. Phys. Lett. (Netherlands), vol.100, no.3, p.292-6 (9 Sept. 1983).
The collision-induced rotational band of CH_4 has been measured at 195K from $\approx$30 to 900 cm^{-1}. These results have been analyzed with a quantum-mechanical lineshape which shows that this spectrum can be understood on the basis of octupole- and hexadecapole-induced dipoles. However, this analysis has revealed the role of bound and predissociating dimers in the spectrum. (18 refs.)

117866 Vibrational predissociation of Van der Waals clusters of ethylene. G.Fischer, R.E.Miller, R.O.Watts (Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia).
Chem. Phys. (Netherlands), vol.80, no.1-2, p.147-55 (Oct. 1983).
Infrared laser spectroscopy and quadrupole mass spectrometry have been used to study clusters of ethylene molecules formed in a free jet expansion. Vibrational spectra in the range 2950-3200 cm^{-1} show structure corresponding to the predissociation of clusters as a result of exciting them near ν_1, ν_{11} and ν_9 fundamentals, as well as the $\nu_2+\nu_{12}$ combination band. These results provide valuable information concerning the structures and dissociation mechanisms for ethylene clusters. In all cases the vibrational bands show lorentzian lineshapes of $\approx$5 cm^{-1} fwhm, suggesting that the dominant broadening mechanism is homogeneous. Estimates of the excited-state lifetimes can therefore be obtained directly from these widths. (20 refs.)

117867 Infrared and nuclear magnetic resonance studies pertaining to the cage model for solutions of acetone in water. M.C.R.Symons, G.R.Eaton (Dept. of Chem., Univ. of Leicester, Leicester, England).
Faraday Symp. Chem. Soc. (GB), no.17, p.31-40 (1982). [received: Sept. 1983] (Symposium on the Hydrophobic Interaction, Reading, Berks., England, 15-16 Dec. 1982).
Solutions of acetone in water show a single C=O stretching mode in the infrared (1697 cm^{-1}), which is assigned to acetone hydrogen bonded to two water molecules. On cooling below 0°C new features appear which are characteristic of concentrated solutions of acetone, formed by growth of ice crystals. These bands are assigned to acetone forming single hydrogen bonds (1708 cm^{-1}) and no hydrogen bonds (1715 cm^{-1}). The latter band is characteristic of bulk acetone. On standing at ca. $-30°C$, all these features decay, and ultimately only a single narrow band is detectable at 1722 cm^{-1}, which is characteristic of isolated acetone molecules in completely inert solvents. This change is clearly a result of clathrate formation. These results demonstrate unequivocally that acetone in liquid water is solvated in a manner that differs completely from cage 'solvation'. This remarkable difference between solid and fluid systems is interpreted in terms of the presence of large concentrations of free OH groups in liquid water. (43 refs.)

117868 Vibrational spectra of some aminonitrotoluenes. R.B.Singh, D.K.Rai (Dept. of Phys., Banaras Hindu Univ., Varanasi, India).
Indian J. Pure & Appl. Phys., vol.20, no.10, p.812-15 (Oct. 1982). [received: April 1983]
The infrared spectra of 2-amino 4-nitrotoluene, 2-amino 5-nitrotoluene, 4-amino 2-nitrotoluene and 4-amino 3-nitrotoluene have been recorded in the region 200-4000 cm^{-1}. The polarized and depolarized laser Raman spectra have also been recorded for 2-amino 4-nitrotoluene and 4-amino 3-nitroluene molecules. The assignments of the observed frequencies to the probable modes of vibration of the molecules are given. (17 refs.)

117869 Argon matrix investigation of the 1:1 molecular complexes of silicon tetrafluoride with water, methanol, and dimethyl ether. B.S.Ault (Dept. of Chem., Univ. of Cincinnati, Cincinnati, OH, USA).
J. Am. Chem. Soc. (USA), vol.105, no.18, p.5742-6 (7 Sept. 1983).
The codeposition of SiF_2 with a variety of oxygen-containing bases in inert matrices at 15K has given rise to a number of novel 1:1 adducts. The spcies $H_2O.SiF_4$, $CH_3OH.SiF_4$, and $(CH_3)_2O.SiF_4$ were each identified and characterized spectroscopically. The most prominent feature of the infrared spectrum of each adduct was an intense Si-F stretching mode between 960 and 990 cm^{-1}. The position of this mode correlated linearly with the degree of base character of the Lewis base in the complex. Additional modes of the 1:1 complex were observed as well, including modes of the perturbed base subunit in the adduct. These modes showed little shift from the position of the free, isolated base, including a quite weak, but specific, interaction with SiF_4. No evidence of a 1:2 adduct was noted under these experimental conditions. (33 refs.)

117870 Infrared studies of molecular ions. I. The ν_3 and of $NH_4{}^+$. M.W.Crofton, T.Oka (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA).
J. Chem. Phys. (USA), vol.79, no.6, p.3157-8 (15 Sept. 1983).
Recently Gudeman, Begemann, Pfaff, and Saykally (1983) developed a powerful technique for spectroscopy of molecular ions using an AC discharge cell, and applied it successfully to the observation of the ν_1 band of HCO^+ and $HN_2{}^+$. In this method, the alternating Doppler shifts of spectral lines due to the drift velocities of molecular ions are used for phase sensitive detection thus discriminating the ion lines from much stronger neutral lines. The existence of a sufficiently large Doppler shift for modulation has been recently demonstrated in a DC discharge. The authors report the application of this method to the observation of the triply degenerate ν_3 fundamental vibration rotation band of the ammonium ion $NH_4{}^+$. (17 refs.)

117871 The ν_3 vibrational spectrum of the free ammonium ion ($NH_4{}^+$). E.Schafer, M.H.Begemann, C.S.Gudeman, R.J.Saykally (Dept. of Chem., Univ. of California, Berkeley, CA, USA).
J. Chem. Phys. (USA), vol.79, no.6, p.3159-60 (15 Sept. 1983).
The authors report the report the first observation of high resolution spectra of $NH_4{}^+$, and give the results of a preliminary analysis of the ν_3 vibrational mode, studied near 3.0 μm with a color center laser spectrometer using the technique of velocity modulated absorption spectropscopy, which they have recently employed for the study of HCO^+, HNN^+, and H_3O^+. (13 refs.)

117872 Study of hydrogen bonds in carbohydrates from the fine structure of the ν(OH) band. R.G.Zhbankov, D.K.Buslov.
J. Appl. Spectrosc. (USA), vol.38, no.1, p.25-32 (Jan. 1983). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.38, no.1, p.33-41 (Jan. 1983).
The authors used differentiation of IR spectra to study the components of the complex ν(OH) band in carbohydrates (D glucose and cellulose). These increased order spectra clearly showed the fine structure of stretching vibration bands of the hydroxcyl groups included in the hydrogen bonds. (21 refs.)

117873 Collision induced rotational spectrum of allene. W.C.Pringle, S.M.Jacobs, D.H.Rosenblatt (Dept. of Chem., Wesleyan Univ., Middletown, CT, USA).
Mol. Phys. (GB), vol.50, no.1, p.205-15 (Sept. 1983).
The far infrared collision induced absorption spectrum for collisions between allene and allene molecules is presented. The anisotropy and large size of allene is shown to dominate the observed rotational spectrum. Only a small fraction of the observed absorbance results from the leading multipole

moment (quadrupole), uniform field and isotropic polarizability and interaction potential. An upper limit to the quadrupole moment of allene, $\Theta=2.45\times10^{-39}Cm^2$, is determined from the low frequency wing of the collision induced absorption spectrum. The anisotropy of the molecular interaction potential, anisotropic polarizability, overlap distortion, field gradient and multipolar terms following the leading quadrupole are shown to contribute higher frequency absorption. Higher frequency collision induced absorption is also calculated when the multipolar expansion to describe the field is replaced by a model with point charges on the allene nuclei. The implication of the point charge model is that the multipole expansion converges slowly for allene-allene collisions. (23 refs.)

117874 Infrared spectra of N-substituted hydroxamic acids. V.C.Koshy, S.G.Tandon (Dept. of Chem., Ravishankar Univ., Raipur, India).
Natl. Acad. Sci. Lett. (India), vol.5, no.10, p.331-5 (Oct. 1982). [received: Oct. 1983]
IR spectra of 17 N-substituted hydroxamic acids, R. N(OH). C(=O).R′, examined in the region 4000 to 400 cm^{-1}, show three sets of group vibrations (i) hydroxamic acid bands, (ii) aromatic bands, and (iii) skeletal bands. Typical bands due to hydroxamic acid grouping are in the region 3244-3080 cm^{-1} for 2(O-H); 1640-1600 cm^{-1} for ν(C=O); 1340-1300 cm^{1} for ν(C-N) and at 920±20 cm^{-1} for ν(N-O). Aromatic bands appear at the typical positions. Low frequency bands (skeletal) in the region 1290-1255, 810-760, 635-585, 560-530, 525-500, 490-445 and 440-420 cm^{-1} are due to δ'(O-H), δ'(C-N), δ'(N-C=O), w(C=O), δ'(C-C=O), τ(C-N) and δ(C-N-C), respectively. (22 refs.)

117875 Vibrational spectrum of 1,3,5-triamino-2,4,6-trinitrobenzene. T.G.Towns (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
Spectrochim. Acta Part A (GB), vol.39A, no.9, p.801-4 (1983).
The mid-infrared (4000-400 cm^{-1}) spectra in KBr matrix of the title compound (TATB) and four of its isotopic derivatives have been analysed for the purpose of vibrational assignments. The relative simplicity of the spectra, in conjunction with the various isotopic shifts, indicates that thirteen of the seventeen principal spectral features can be attributed to vibrational modes originating in the amino- and nitro-moieties; the remaining four bands to skeletal vibrations. In comparison with spectra of aniline and nitrobenzene, the assignments are consistent with predicted spectral changes due both to hydrogen-bonding and to the presence of canonically electron-withdrawing and electron-donating substituents. (9 refs.)

117876 Evidence of intramolecular hydrogen bonding in a complex *N,N*-disubstituted formamide. R.E.Echols, R.H.Miller, D.Chriss, E.Vessel (Dept. of Chem. & Health Res., Southern Univ., Baton Rouge, LA, USA).
Spectrochim. Acta Part A (GB), vol.39A, no.9, p.805-7 (1983).
Intramolecular hydrogen bonding has been determined to be the controlling factor in the cis-trans isomer ratio in *N*-(2-hydroxy-5-nitrobenzyl)-*N*-(1-methylthio-2-propenyl)formamide. Both ^1H NMR and i.r. show the presence of intramolecular hydrogen bonding in this compound. (8 refs.)

33.20F Raman and Rayleigh spectra

(inc. scattering)

117877 Double resonance excitation of fluorescence by stimulated Raman scattering. S.H.Lee, D.C.Nguyen, J.C.Wright (Dept. of Chem., Univ. of Wisconsin, Madison, WI, USA).
Appl. Spectrosc. (USA), vol.37, no.5, p.472-4 (Sept.-Oct. 1983).
The authors report the results of an experiment that tests the feasibility of double resonance excitation of fluorescence by stimulated Raman scattering. The method is limited by a strong, interfering two-photon process. (6 refs.)

117878 Raman spectroscopic studies on the vibrational relaxation of benzonitrile in benzene solution. H.Abramczyk (Inst. of Appl. Radiation Chem., Tech. Univ., Lodz, Poland).
Chem. Phys. Lett. (Netherlands), vol.100, no.3, p.287-91 (9 Sept. 1983).
Linewidths of isotropic Raman bands of benzonitrile at 2223 and 452 cm^{-1} were measured as a function of concentration in benzene solution. Experimental results have been compared with those calculated on the basis of the Fischer-Laubereau binary-collision dephasing model and the Knapp-Fischer concentration-fluctuation model. The dephasing model with a purely repulsive potential reproduces the experimental data for both bands. (18 refs.)

117879 Raman spectra of araliphatic peroxides. I.P.Zyat'kov, D.I.Sagaidak, G.A.Pitsevich, V.I.Gogolinskii, N.M.Ksenofontova.
J. Appl. Spectrosc. (USA), vol.38, no.1, p.94-101 (Jan. 1983). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.38, no.1, p.110-20 (Jan. 1983).
The authors have obtained and studied the Raman spectra of ten diacyl peroxides of an araliphatic series with the general formula RC(O)OOC(O)PhR′, where the R and R′ groups for the respective compounds are: (I) $R=CH_3$, R′=n-I; (II) $R=CH_3$, R′=H; (III) $R=CH_3$, R′=n-O (IV) $R=Ch_3$, R′=n-Cl; (V) $R=CH_3$, R′=n-Br; (VI) $R=CH_3$, $R'=n\text{-}CH_3$; (VII) $R=CH_3\text{-}(CH_2)_2$, R′=H; (VIII) $R=CH_3$, R′=m-Cl; (IX) $R=CH_3$, R′=m-F; (X) $R=CH_3$, $R'=m\text{-}NO_2$. Vibration analyses have been performed. (13 refs.)

117880 Depolarized Rayleigh scattering—temperature dependence of molecular reorientation of CO_2 at constant density. H.Versmold, U.Zimmermann (Phys. Chem., Univ. Dortmund, Dortmund, Germany).
Mol. Phys. (GB), vol.50, no.1, p.65-75 (Sept. 1983).
Depolarized Rayleigh scattering experiments at two constant densities, 0.47 ρ_c and 1.9 ρ_c (ρ_c=critical density), have been carried out in the temperature range 25°C to 150°C. From the spectra, orientational correlation and memory functions are calculated, which are compared with corresponding correlation functions of the J-diffusion model, of the mean squared torque approximation, and of recent molecular dynamics investigations. It is found that the J-diffusion collision parameter β^* as well as the mean squared torque factor $\langle N^2\rangle/4(kT)^2$ decrease with increasing temperature at constant density. Further, at the density $1.9\rho_c$ the J-diffusion model fails to account for the short time dynamics. At this density the memory function shows a shallow negative minimum which is related to a reversal of the angular velocity of the CO_2 molecules in the dense fluid state. This highly damped librational motion gets less pronounced with increasing temperature at constant density. (35 refs.)

117881 Absorption spectrum of the carbon tetrachloride molecular cation in noble-gas matrices. L.Andrews, B.J.Kelsall, J.H.Miller, B.W.Keelan (Chem. Dept., Univ. of Virginia, Charlottesville, VA, USA).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.9, p.1417-24 (Sept. 1983).
Carbon tetrachloride diluted in argon, krypton or xenon and subjected to vacuum-ultraviolet radiation during and after condensation gave strong photosensitive absorptions at 425, 430 and 455 nm, respectively, which are assigned to CCl_4^+. This study suggests that absorptions in this region following radiolysis of CCl_4 in hydrocarbon glasses are probably due to CCl_4^+ as well and that structural relaxation follows ionization of CCl_4 in the solid phase. (27 refs.)

117882 Rydberg transitions in the bichromophoric molecules tetramethyl-1, 3-cyclobutanedithione (TMCBDT) and tetramethyl-3-thiocyclobutan-1-one (TMTCB). I.Trabjerg (Dept. of Phys. Chem., H.C. Orsted Inst., Copenhagen, Denmark), M.Vala, J.Baiardo.
Mol. Phys. (GB), vol.50, no.1, p.193-203 (Sept. 1983).
The vacuum ultraviolet spectra of tetramethyl-1, 3-cyclobutanedithione (TMCBDT) and tetramethyl-3-thio-cyclobutan-1-one (TMTCB) in the 140-240 nm range are reported. Each spectrum is analysed and shown to consist of various Rydberg series. While transitions from the non-bonding orbital on the C=S to ns_S, np_S and nd_S Rydberg orbitals dominate the spectra of both compounds, a short series assigned to the non-bonding C=O to ns_O orbitals is observed in TMTCB. The splitting of the n orbitals in TMCBDT is considerably smaller than that in TMTCB or TMCBD. The difference in the n orbital splitting in the two symmetrical molecules, TMCBD and TMCBDT, is attributed to the difference between the orbital energy spacings (n_{CS} or n_{CS}) and the closest-lying σ relay orbital responsible for the through bond interaction. The large splitting in TMTCB is due to the difference in ionization potential between sulphur and oxygen. For this same reason the two highest occupied orbitals in TMCBDT fit into the conventional concept of non-bonding orbitals localized on the heteroatom. In TMCBD the non-bonding orbitals are shown to be ring orbitals with some oxygen p character mixed in. (24 refs.)

33.20L Ultraviolet spectra

117883 Target factor analysis of the ultraviolet spectra of unresolved liquid chromatographic fractions. M.McCue, E.R.Malinowski (Dept. of Chem., Stevens Inst. of Technol., Hoboken, NJ, USA).
Appl. Spectrosc. (USA), vol.37, no.5, p.463-9 (Sept.-Oct. 1983).
Target factor analysis error criteria are applied to the UV spectra of unresolved liquid chromatographic fractions. The method is used not only to determine the number of components contributing to an unresolved chromatographic peak but also to individually verify the presence of suspected components without requiring any knowledge of the other components. An actual experimental example is presented using mixtures of *o*-xylene, ethylbenzene, and *p*-xylene. Factor analysis criteria are used to indicate which one of the fractions contains a UV-absorbing impurity(ies). (11 refs.)

117884 Electronic absorption spectrum of 2-amino-4-methyl pyrimidine in vapour phase. S.P.Gupta, S.K.Sharma (Dept. of Chem., DN Coll., Meerut, India), R.K.Goel.
Acta Phys. Pol. A (Poland), vol.A64, no.3, p.335-40 (Sept. 1983).
The ultraviolet absorption spectrum of 2-amino-4-methyl pyrimidine has been observed in the vapour phase. Two electronic band systems due to $n\text{-}\Pi^*$ and $\Pi\text{-}\Pi^*$ transitions have been observed corresponding to 3200 and 2430 Å systems of pyrimidine respectively. The observed fundamentals and their assignments are reported and discussed. (14 refs.)

117885 Ultraviolet and mass spectra of Schiff bases derived from 4,4-dimethyl-3-oxo-valeraldehyde, acetylacetone and benzoylacetone. A.A.H.Saeed, A.W.A.Sultan, S.A.Selman, N.A.Abood (Dept. of The Coll. of Sci., Basrah Univ., Basrah, Iraq).
Can. J. Spectrosc. (Canada), vol.28, no.3, p.104-5 (1983).
Ultraviolet data are reported for 4,4-dimethyl-3-oxo-valeralydienecyclohexylamine. In addition the mass spectra of Schiff bases derived from 4,4-dimethyl-3-oxo-valeraldehyde, acetylacetone and benzoylace-

tone and aromatic amines have been measured and interpreted in terms of ketamine-enolimine tautomers. (15 refs.)

117886 Rotational perturbations in the CN($B^2\Sigma^+$-$X^2\Sigma^+$) tail band system. II. Identification of the CN($^4\Pi$) state and its vibrational levels. Y.Ozaki, H.Ito, K.Suzuki, T.Kondow, K.Kuchitsu (Dept. of Chem., Univ. of Tokyo, Tokyo, Japan).
Chem. Phys. (Netherlands), vol.80, no.1-2, p.85-94 (Oct. 1983).
For pt.I see ibid., vol.80, p.73 (1983). The intensity anomalies observed in the 12-12 (N=10), 14-14 (N=7, 10) and 17-14 (N=17, 19) lines of the CN violet bands are found to be due to rotational perturbations by the CN($^4\Pi$) state. Experimental evidence that the perturbing state is $^4\Pi$, predicted theoretically by Schaefer and Heil (1971), is presented, and the spectroscopic constants of this state are estimated. (22 refs.)

117887 Abnormal behaviour in the evolution of the UV spectra of parafluorophenylacetic acid as a function of pH. D.Denis-Courtois, B.Vidal (Lab. de Spectroscopie de la Reactivite Chimique, Univ. des Sci. et Tech. de Lille, Villeneuve d'Ascq, France).
J. Chim. Phys. & Phys.-Chim. Biol. (France), vol.80, no.6, p.559-61 (June 1983). In French.
The spectrum of parafluorophenylacetic acid shows anomalous behaviour towards pH=3.95. The molecular absorption coefficient ϵ_{00} decreases strongly although the intensity of the whole transition remains a constant. This phenomenon can be explained on the ground of a widening of the transition for a given interaction with the solvent. (14 refs.)

33.25 NUCLEAR MAGNETIC RESONANCE AND RELAXATION; NUCLEAR QUADRUPOLE RESONANCE (NQR)

117888 Nuclear magnetic resonance relaxation investigation of tetrahydrofuran and methyl iodide clathrates. M.Junio, D.O.Leicht, M.D.Zeidler (Inst. fur Phys. Chem., RWTH Aachen, Aachen, Germany).
Faraday Symp. Chem. Soc. (GB), no.17, p.25-30 (1982). [received: Sept. 1983] (Symposium on the Hydrophobic Interaction, Reading, Berks., England, 15-16 Dec. 1982).
Proton and deuteron spin-lattice relaxation rates of the guest molecules have been measured as a function of temperature in methyl iodide and tetrahydrofuran clathrates. By use of the isotopic-dilution method in proton NMR, i.e. employing the compounds $(CH_3I)_x.(CD_3I)_{1-x}.17D_2O$ and $(C_4H_8O)_x.(C_4D_8O)_{1-x}.17D_2O$ with varying mole fractions x, intramolecular and intermolecular contributions to the proton relaxation rate may be separated. Deuteron relaxation rates have been measured in the compounds $CD_3I.17H_2O$ and $C_4D_8O.17H_2O$. The maximum temperature range covered was 0 to −120°C. The proton relaxation rates contain rather large intermolecular contributions, ca. 45% for methyl iodide and 23% for tetrahydrofuran. The correlation times obtained from the intramolecular contributions lie in the range 1-12 and 0.5-1 ps for methyl iodide and tetrahydrofuran, respectively, which is the range typical for liquids. This confirms the well known fact that the enclathrated guest molecules move very fast. The evaluation of the deuteron relaxation rates leads to correlation times which are comparable to those derived from the intramolecular proton rate for tetrahydrofuran, but differ in the case of methyl iodide. This indicates anisotropic rotational motion of the methyl iodide molecule in the clathrate cage. (11 refs.)

117889 NMR spectra of porphyrins. XXI. Applications of the ring-current model to porphyrin and chlorophyll aggregation. R.J.Abraham, K.M.Smith (Robert Robinson Labs., Univ. of Liverpool, Liverpool, England).
J. Am. Chem. Soc. (USA), vol.105, no.18, p.5734-41 (7 Sept. 1983).
For pt.XX, see Org. Mag. Reson., vol.19, p.204 (1982). A program incorporating double dipole model of the macrocyclic ring current in the porphyrin and chlorin ring is presented which allows the geometry of the aggregated species in solution to be obtained from observed NMR aggregation shifts. The model is capable of handling dimeric or oligomeric aggregates with either head-to-head or head-to-tail structures; also, one porphyrin may be rotated with respect to the other. Side chains may be rotated separately. The application of the model to a variety of previously recorded aggregates is presented. In the porphyrin series, the refined model allows a more rigorous search procedure than hitherto, and this shows that the structure of the dimers of zinc(II) meso-nitrooctaethylporphyrin and zinc(II), α-β-meso-dinitrooctaethylporphyrin are more similar than was previously recognized. In both structures the coordination is between the zinc atom and the most electron-rich pyrrole subunit of the adjacent molecule. The aggregation shifts of zinc(II) 2-vinylphylloerythrin methyl ester were analyzed and shown to agree with both a centrosymmetric and a twofold symmetric dimer structure. The latter allows maximum interations between the electron-rich and electron-deficient rings and is preferred. In neither case is there any evidence of interaction between the metal and side-chain donor groups. Application of the model to the published aggregation shifts of chlorophyll a and chlorophyll b provides the first quantitative explanation of these aggregation shifts and defines new structures for the aggregates. (31 refs.)

117890 A proton nuclear magnetic resonance study of purine and pyrimidine nucleoside 5′-diphosphates. Extent of macrochelete formation in monomeric metal ion complexes and promotion of self-stacking by metal ions. K.H.Scheller, H.Siegel (Inst. of Inorganic Chem., Univ. of Basel, Basel, Switzerland).
J. Am. Chem. Soc. (USA), vol.105, no.18, p.5891-900 (7 Sept. 1983).
The concentration dependence of the chemical shifts for protons H-2, H-8, H-1′ of ADP^{3-} and IDP^{3-}, H-8 and H-1′ of GDP^{3-}, and H-5, H-6, and H-1′ of CDP^{3-} and UDP^{3-} has been measured in D_2O at 27°C. The results are consistent with the isodesmic model of indefinite noncooperative stacking. The association constants for the nucleoside 5′-diphosphates (NDP^{3-}) are between 1.8 (ADP^{3-}) and about 0.6 M^{-1} (UDP^{3-}). The self-stacking tendency of the base moieties of the nucleic acids decreases in the series adenine>guanine≳hypoxanthine>cytosine~uracil. Due to the repulsion of the negatively charged phosphate moieties, self-association is always less pronounced for NDP^{3-} compared to that of the corresponding nucleoside. The self-stacking tendency of NDP^{3-} systems is promoted by a factor of about 2-3 by coordination of Mg^{2+} to the phosphate moiety, which neutralizes part of the negative charge. However, the self-association tendency of $Zn(ADP)^-$ and $Cd(ADP)^-$ or $Zn(IDP)^-$ and $Cd(IDP)^-$ is much larger than that of $Mg(ADP)^-$ or $Mg(IDP)^-$; this is explained by an increased tendency to form an intermolecular metal ion bridge in the dimeric stacks in which Zn^{2+} or Cd^{2+} is coordinated to the phosphate moiety of one NDP^{3-} and to N-7 of the purine residue of the other NDP^{3-}. The shifts of H-8 (and H-2) for complete stacking (δ_∞) agree with this interpretation. Comparison of H-8 at infinite dilution (δ_0) for several systems reveals that an M^{2+}-N-7 interaction exists in the monomeric Zn^{2+} and Cd^{2+} complexes of the purine nucleoside 5′-diphosphates; i.e. a macrochelate is formed through an intramolecular coordination of the metal ion to the phosphate moiety and to N-7. (60 refs.)

117891 Dynamic NMR study of conjugation in tert-butyl thiolformate. E.A.Noe, T.Sanders, F.Badelle, L.Douyon (Dept. of Chem., Jackson State Univ., Jackson, MS, USA).
J. Am. Chem. Soc. (USA), vol.105, no.18, p.5918-20 (7 Sept. 1983).
The authors describe a dynamic NMR study of tert-butyl thiolformate; comparison of the results with the barriers for tert-butyl formate provides information about the relative conjugating abilities of oxygen and sulfur, with the formyl group as π-acceptor. The room-temperature NMR spectrum (90.02 MHz) in acetone-d_6 shows a single peak for the formyl proton at δ 10.22. At lower temperatures, the peak broadens and splits into two lines at δ0.99 and 10.17, with populations of 0.18 and 0.82, respectively, at −105°C. A free-energy difference at −105°C of 0.51 kcal/mol was calculated from the relationship $\Delta G° = -RT\ln K$, and populations of 0.20 and 0.80 were estimated at the coalescence temperature (−87°C), assuming that $\Delta G°$ does not change with temperature. (25 refs.)

117892 Measurement of the rotational barrier of a tetraalkylhydrazine radical cation. S.F.Nelsen, G.T.Cunkle, D.H.Evans (Dept. of Chem., Univ. of Wisconsin, Madison, WI, USA).
J. Am. Chem. Soc. (USA), vol.105, no.18, p.5928-9 (7 Sept. 1983).
Heteratom-substituted radicals are resonance stabilized by donation of a lone-pair electron to the radical center. The authors report the measurement of the barrier to rotation in a tetraalkylhydrazine radical. (13 refs.)

117893 Solute-solvent interactions: nuclear relaxation of nitric oxide solutions in perfluoro solvents. M.-J.Stebe, G.Serratrice, J.-J.Delpuech (Lab. de Chimie Phys. Organique, Faculte des Sci., Univ. de Nancy I, Vandoeuvre Les Nancy, France).
J. Chim. Phys. & Phys.-Chim. Biol. (France), vol.80, no.6, p.547-51 (June 1983). In French.
Nuclear relaxation times are measured in paramagnetic solutions of nitric oxide in various perfluorocarbons. The authors' results confirm the necessity for considering three classes of solvents: aliphatic, cyclic and aromatic. (C_7F_{16}, $C_6F_{11}CF_3$, $CF_3N(CF_2)_4CF_2$, $CF_3N(CF_2)_2OCF_2CF_2$, C_6F_6 and C_6H_6.) The paramagnetic relaxation rates induced by NO molecules are found to be much smaller than expected on the basis of their static magnetic susceptibility (as compared to that of O_2 molecules). This is due to a strong coupling of electronic spin and angular momentum along the line joining the nuclei, themselves coupled to the rotational momentum of the molecule, thus resulting in a considerable reduction of the effective paramagnetic moment of NO molecules. Moreover the reduction is dependent on the reorientation rate of NO molecules and is expected to be larger in aliphatic than in aromatic fluorocarbons due to the presence of larger cavities in the former solvents. Effectively, the magnitude of paramagnetic relaxation rates, although very small, is quite dependent upon the solvent considered, in the expected sequences (aliphatic<cyclic<aromatic). (17 refs.)

117894 Comparative structural study by dipole moments and NMR (^{1}H, 250 MHz) of dimethyl-6,6-cycloundecanones of carbon, silicon and germanium. P.Mazerolles, A.Faucher (Lab. des Organometalliques, Univ. Paul Sabatier, Toulouse, France), P.Mauret, J.-P.Faye, D.Mermillod-Blardet.
J. Chim. Phys. & Phys.-Chim. Biol. (France), vol.80, no.6, p.553-7 (June 1983). In French.
The conformations of 6,6-dimethyl 6-sila (and 6-germa) cycloundecanones and of the corresponding carbon cyclanone were studied, using 250 MHz NMR and dipole moment measurements in solution at 25°C. The synthesis of 6,6-dimethyl-cycloundecanone, a new compound, was carried out in seven steps, starting from dimethylglutaric acid. The nature of the heteroatom has no noticeable influence on the conformational equilibrium. The possibility to have in solution conformations in which the C=0 group is partially directed inside the ring is in good agreement with the position almost perpendicular with respect to the average plane of the molecule, which is observed, in solid state, for the germanium derivative. (11 refs.)

117895 Finite-field many-body perturbation theory of the Fermi contact nuclear-spin coupling. M.Iwai, A.Saika (Dept. of Chem., Kyoto Univ., Kyoto, Japan).
Phys. Rev. A (USA), vol.28, no.4, p.1924-9 (Oct. 1983).
The Fermi contact term of the nuclear-spin-spin coupling in the HD molecule is calculated using finite-field many-body perturbation theory (FF MBPT). The one-electron states are generated by the Hartree-Fock potential in the presence of the Fermi contact interaction. The procedure through third order in electron correlation gives a value for the Fermi contact term of 37.2 Hz in fair agreement with the best estimated value of 40.0 Hz at the equilibrium internuclear distance. The result suggests that the FF MBPT approach provides a highly efficient and systematic method for the calculation of the Fermi contact term. A possible origin of the general overestimate by the coupled Hartree-Fock method is also discussed. (26 refs.)

117896 Investigations on the electronic flow of organyl ligands. V. The substituent relations of the coupling constants $^1J(^{199}Hg$-$^{13}C)$ of mercury organyl compound and the hybridisation concept. R.Radeglia (Zentralinst. fur Phys. Chem., Akad. der Wissenschaften, Berlin, Germany), D.Steinborn, R.Taube.
Spectrochim. Acta Part A (GB), vol.39A, no.9, p.843-5 (1983).
For pt.IV see J. Organomet. Chem., vol.234, p.277 (1982). In diorganyl mercury compounds R'-Hg-R'' the ratio of the ^1J(Hg-C) coupling constants of the unsymmetric substituted compounds and the corresponding symmetric compounds HgR'_2 and HgR''_2, respectively, can be interpreted with the Fermi contact term on the basis of the simple hybrid orbital model. Occurring deviations have been diminished using an empiric term which depends only on the coupling constants of the symmetric compounds. (12 refs.)

33.30 ELECTRON PARAMAGNETIC RESONANCE AND RELAXATION

117897 Trigonal-^{13}C hyperfine coupling in CF_3CCl_2. B.W.Walther, F.Williams (Dept. of Chem., Univ. of Tennessee, Knoxville, TN, USA).
J. Chem. Phys. (USA), vol.79, no.6, p.3167-9 (15 Sept. 1983).
If it is well established that the progressive introduction of α-fluorine substituents induces pyramidality at the trigonal carbon in simple alkyl radicals. A corresponding but less-pronounced effect would also be expected for α-chlorine substitution. In comparison with fluorinated alkyl radicals, much less is known about the configurations of α-chloroalkyl radicals, and ^{13}C hyperfine data for this series have hitherto been limited to the CCl_3 radical. The authors report the trigonal-^{13}C coupling for the CF_3CCl_2 radical which shows that the configuration of this radical is nearly planar. (13 refs.)

117898 Electrochemical and ESR studies of 5,6:11,12-bis(dichalcogeno) tetracenes and their cation radicals. M.T.Jones, S.Jansen (Dept. of Chem., Univ. of Missouri, St. Louis, MO, USA), L.A.Acampora, D.J.Sandman.
J. Phys. Colloq. (France), vol.44, no.C-3, p.1159-65 (June 1983). (Colloque International du CNRS sur la Physique et la Chimie des Metaux Synthetiques et Organiques (International Colloquium of CNRS on the Physics and Chemistry of Synthetic and Organic Metals), Les Arcs, France, 14-18 Dec. 1982).
Electrochemical and ESR studies of the homologous series of 5,6:11, 12-bis(dichalcogeno)tetracene (X=S, Se or Te) and their cation radicals are reported. Each of the neutral compounds displays two reversible one electron oxidation steps in benzonitrile. The potential difference between these two steps is relatively constant through the series. The solution ESR spectral results show a progressive increase in the spectral linewidth of 0.25, 2.5 and 20G, respectively, as one moves through the series S, Se and Te. Observed is a progressive increase in the isotropic g-value. Both phenomena are explained in terms of the increasing spin-orbit interaction as one moves from lighter to the heavier elements. Also observed and reported for the first time is a resolved ESR spectrum of 5,6:11,12-bis(dithio)tetracene cation radical in methylene chloride. A proton hyperfine splitting of 0.553 (±0.004)G which arises from eight magnetically equivalent protons is observed. These results are consistent with the expected charge and spin density distributions obtained from Huckel and McLachlan calculations. The components of the anisotropic g-tensors for TTT^+ and $TSeT^+$ have been measured and are reported. (14 refs.)

33.35 DOUBLE RESONANCES AND OTHER MULTIPLE RESONANCES

117899 Observation of the $\nu_3 \rightarrow (2\nu_3,A_1)$ band of methane. A.de Martino, R.Frey, F.Pradere (Lab. d'Optique Quantique, Ecole Polytech., Palaiseau, France).
Chem. Phys. Lett. (Netherlands), vol.100, no.4, p.329-33 (16 Sept. 1983).
Double-resonance spectra were recorded for several rotational sublevels of the $(2\nu_3,A_1)$ vibrational level of methane. The observed vibrational energy is 5968.1 cm^{-1}, in good agreement with local-mode theory. The effective rotational constant for this level was found to be 5.31 cm^{-1}. This unexpectedly high value could involve interactions with lower vibrational levels. (10 refs.)

33.35H MODR and PMDR (microwave optical double resonance and phosphorescence microwave double resonance)

117900 Spin relaxation in the phosphorescent triplet state of several pyridyl carbonyl compounds. S.G.Hilburn, R.K.Power, K.A.Martin, A.M.Nishimura (Dept. of Chem., Westmont Coll., Santa Barbara, CA, USA).
Chem. Phys. Lett. (Netherlands), vol.100, no.5, p.429-35 (23 Sept. 1983).
Spin relaxation is observed in benzophenone, isomers of benzoylpyridines and dipyridyl ketones. Models are used to describe optically detected echo shapes observed by transient techniques in the phosphorescent triplet state. Framed after the density matrix approach, the echo shapes were found to adequately fit the analytical expressions. Hahn spin echo, Carr-Purcell multiple echo, and rotary echo pulse sequences were used to study the nuclear contribution to the electron spin dephasing and the proximity effect of the nitrogen nuclei to the localized triplet excitation in the carbonyl portion of the molecule. (23 refs.)

33.50 FLUORESCENCE, PHOSPHORESCENCE; RADIATIONLESS TRANSITIONS (INTERSYSTEM CROSSING, INTERNAL CONVERSION)

117901 Quenching of the fluorescence of substituted benzenes by halomethanes. H.A.Khwaja, G.P.Semeluk, I.Unger (Dept. of Chem., Univ. of New Brunswick, Fredericton, Canada).
Can. J. Chem. (Canada), vol.61, no.9, p.1952-6 (Sept. 1983).
Rate constants, k_q, for the quenching of the singlet state of benzene, toluene, *p*-xylene, fluorobenzene, trifluoromethyl benzene, *p*-bis(trifluoromethyl)benzene, and aniline by CCl_4, CH_3CCl_3, $CHCl_3$, and $CFCl_3$ in the gas phase have been determined. In each instance the quenching is via a charge-transfer complex with the aromatic acting as donor. There is a linear dependence between ln k_q and IP (ionization potential) of the aromatics which supports Klein's model for exciplex formation. The most effective quencher is CCl_4 while the least effective is $CFCl_3$. The most effective donor was aniline while the least effective one was *p*-bis(trisfluoromethyl)benzene. In general, fluorinated aromatics are less effective donors than the corresponding protonated molecules. (22 refs.)

117902 Laser-induced fluorescence detection of OH produced by reaction of hot H atoms with CO_2. C.R.Quick,Jr., J.J.Tiee (Chem. Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
Chem. Phys. Lett. (Netherlands), vol.100, no.3, p.223-6 (9 Sept. 1983).
Laser-induced fluorescence (LIF) detection of OH radicals is used to examine the reaction of CO_2 molecules with translationally hot H atoms generated by ArF laser photolysis of HBr. Prompt formation of rotationally excited OH X $^2\Pi_i(v''=0,1,2)$ has been observed. (21 refs.)

117903 Infrared multiphoton excitation of SO_2 to fluorescent states. T.B.Simpson, N.Bloembergen (Gordon McKay Lab., Harvard Univ., Cambridge, MA, USA).
Chem. Phys. Lett. (Netherlands), vol.100, no.4, p.325-8 (16 Sept. 1983).
SO_2 molecules excited under essentially collision-free conditions by intense (>20 GW/cm^2) CO_2 laser pulses give off a broad UV-visible luminescence through inverse electronic relaxation. Unlike in larger polyatomics, the infrared multiphoton excitation process is controlled by the laser intensity and not the laser fluence. (18 refs.)

117904 Coriolis effects on 'intermediate case' of intramolecular vibrational relaxation: rotational-temperature dependence of energy-resolved fluorescence from jet-cooled perylene with 776-975 cm^{-1} excess energies. B.E.Forch, K.T.Chen, E.C.Lim (Dept. of Chem., Wayne State Univ., Detroit, MI, USA).
Chem. Phys. Lett. (Netherlands), vol.100, no.5, p.389-92 (23 Sept. 1983).
The rotational-temperature dependence of the energy-resolved fluorescence, combined with the calculated level density, indicates that the large variations in the rate of the intramolecular vibrational relaxation over a small excess energy in S_1 perylene is due to the fluctuations in the density of accessible vibrational levels, resulting from the vibrational selection rules for second-order Coriolis coupling. (8 refs.)

117905 IR multiple-photon excitation distribution probed by IR fluorescence. M.Brestel, A.Yogev (Dept. of Isotope Res., Weizmann Inst. of Sci., Rehovot, Israel).
Chem. Phys. Lett. (Netherlands), vol.100, no.5, p.408-14 (23 Sept. 1983).
Vibrational fluorescence induced by IR multiple-photon excitation of hexafluorocyclobutene was measured as a function of laser frequencies. The width and shift of the inhomogeneous broadened fluorescence bands represent the excitation energy. The contrasting shapes of the excitation and previously measured chemical yield spectra are explained by the Poisson distribution of the molecules in the quasicontinuum. (18 refs.)

117906 Picosecond fluorescence relaxation kinetics from all-trans retinal. A.G.Doukas, M.R.Junnarkar, D.Chandra, R.R.Alfano, R.H.Callender (Dept. of Phys., City Coll. of New York, New York, NY, USA).
Chem. Phys. Lett. (Netherlands), vol.100, no.5, p.420-4 (23 Sept. 1983).
The fluorescence relaxation kinetics from all-trans retinal in polar and nonpolar solvents have been investigated as a function of temperature. An activation energy of ≈ 1 kcal/mole has been measured. The results, in conjunction with previous picosecond absorption measurements made by Hochstrasser et al. (1976), strongly suggest that initially excited molecules to Franck-Condon states relax to three singlet excited states. (8 refs.)

117907 Determination of the quenching rates of $N_2^+(B^2\Sigma_u^+, \nu=0,1)$ by N_2 using laser-induced fluorescence. J.Jolly, A.Plain (Lab. de Phys. des Gaz et des Plasmas, Univ. Paris-Sud, Orsay, France).
Chem. Phys. Lett. (Netherlands), vol.100, no.5, p.425-8 (23 Sept. 1983).
Time-resolved fluorescence laser-induced spectroscopy was used to examine the quenching of the vibrational levels $\nu=0$ and $\nu=1$ of $N_2^+(B^2\Sigma_u^+)$ by N_2. The rate coefficients of the quenching reactions are found to be constant over the temperature range 300-500K. The quenching constant for the $\nu=1$ state was found to be approximately twice the value of the quenching constant of the $v=0$ state. (11 refs.)

117908 Generation of $^1O_2$ from O_2 quenching of the lowest excited singlet and triplet states of 9,10-diphenylanthracene. W.Drews, R.Schmidt, H.-D.Brauer (Inst. for Phys. & Theoretical Chem., Univ. of Frankfurt, Frankfurt/Main, Germany).
Chem. Phys. Lett. (Netherlands), vol.100, no.5, p.466-9 (23 Sept. 1983).
Measurements of the quantum yield for photoperoxidation of 9,10-diphenylanthracene as a function of dissolved oxygen concentration in toluene at 20°C, are consistent with generation of $^1O_2$ from both the lowest singlet and triplet states of the hydrocarbon. (27 refs.)

117909 Comments on 'Generation of $^1O_2$ and the mechanism of internal conversion in 9,10-diphenylanthracene'. H.-D.Brauer, R.Schmidt (Inst. for Phys. & Theoretical Chem., Univ. of Frankfurt, Frankfurt/Main, Germany).
Chem. Phys. Lett. (Netherlands), vol.100, no.5, p.470-1 (23 Sept. 1983).
For original paper see A.P. Darmanyan, ibid., vol.91, p.396 (1982). The authors comment on Darmanyan's paper concerning the generation of $^1O_2$ by 9,10-diphenylanthracene (DPA) where channels for the quenching of the S_1 and T_1 states of DPA by oxygen were considered. They point out that one of the expressions derived by Darmanyan is incorrect. (3 refs.)

117910 Generation of $^1O_2$ by 9,10-diphenylanthracene. A.P.Darmanyan (Inst. of Chem. Phys., Acad. of Sci., Moscow, USSR).
Chem. Phys. Lett. (Netherlands), vol.100, no.5, p.472-4 (23 Sept. 1983).
The author comments on previous papers by himself (ibid., vol.91, p.396 (1982)) and Drews et al. (ibid., vol.100, p.466 (1982)) on the quenching of excited singlet (S_1*) and triplet (T) states of 9,10-diphenylanthracene by $^3O_2$ with the generation of $^1O_2$. (17 refs.)

117911 The heavy atom effect in the room temperature luminescence of some pesticides and ecologically related compounds. G.F.Kirkbright, A.E.S.Shaw (Dept. of Instrumentation, Univ. of Manchester Inst. of Sci. & Technol., Manchester, England).
Can. J. Spectrosc. (Canada), vol.28, no.3, p.100-3 (1983).
Studies are described in which the luminescence characteristics of some pesticides and biphenyl compounds, at the submicrogram level, were examined, with particular reference to improvement of detection limits by utilisation of the heavy atom (HA) effect and to measurement of room temperature phosphorescence (RTP) of samples deposited on filter paper. (15 refs.)

117912 The theory of transitions between electronic states. Application to radiation transitions in polar solvents. L.D.Zusman (Inst. of Inorganic Chem., Acad. of Sci., Novosibirsk, USSR).
Chem. Phys. (Netherlands), vol.80, no.1-2, p.29-43 (Oct. 1983).
In this work the theory of transitions between electronic states is developed. In the limiting cases of weak and strong interactions the analytical results for the full rates of transitions are found. It is shown that in the case of strong interactions the result for the rates of transition is independent of the specific form of partial rates and its form is determined fully by the principle of detailed balance. Using the Pade approximation, the expression for the full rate of transition is found in the case of interactions of mediate strength. The theory is applied to the description of radiationless transitions in polar solvents. (31 refs.)

117913 The effect of a magnetic field on discrete and continuum CS_2 fluorescence. S.J.Silvers, M.R.McKeever, G.K.Chawla (Dept. of Chem., Virginia Commonwealth Univ., Richmond, VA, USA).
Chem. Phys. (Netherlands), vol.80, no.1-2, p.177-82 (Oct. 1983).
The fluorescence of CS_2 vapor, excited by a nitrogen laser, consists of discrete bands superimposed upon an apparent continuum. The bands are progressions from an initially excited T^1A_2 vibronic level, while the continuum appears to arise subsequent to collisional and possibly intramolecular relaxation processes. Here it is seen that an 18 kG magnetic field quenches 75% of the discrete fluorescence, but that the discrete lifetime is unaffected. This discrete quenching is interpreted as Zeeman detuning of the exciting and absorbing lines. Also, the continuum is partially quenched by the 18 kG field. At 340 mTorr 20% of the continuum fluorescence is quenched. The present quenched decreases with decreasing CS_2 pressure. Below 25 mTorr no continuum quenching is observed. The field reduces the rate at which collisions enhance continuum formation. (13 refs.)

117914 Matrix-isolation spectroscopy of Pb_2. H.Sontag, B.Eberle, R.Weber (Fakultat for Phys., Univ. Konstanz, Konstanz, Germany).
Chem. Phys. (Netherlands), vol.80, no.3, p.279-88 (15 Oct. 1983).
Fluorescence and Raman scattering were observed from Pb_2 isolated in neon and argon matrices. Two new excited states were observed by two-photon stepwise excitations, which involve low-lying electronic states of Pb_2. Most spectroscopic constants of the states observed could be given and complement previous results. Two resonance Raman progressions with $\omega_e = 112.5$ and 123.1 cm^{-1} and a single Raman signal at 80 cm^{-1} were observed in argon matrices. The $\omega_e = 123.1$ cm^{-1} Raman signal which had recently been assigned to a larger Pb cluster was shown to arise from Raman scattering within the electronically excited A state of Pb_2 at ≈ 5550 cm^{-1}. (16 refs.)

117915 Determination of the dipole moment of thioformaldehyde in the $\tilde{a}$ $^3A_2$ excited state by laser phosphoresence excitation spectroscopy. D.J.Clouthier, C.M.L.Kerr (Herzberg Inst. of Astrophys., Nat. Res. Council of Canada, Ottawa, Ontario, Canada).
Chem. Phys. (Netherlands), vol.80, no.3, p.299-304 (15 Oct. 1983).
Doppler-limited phosphorescence excitation spectra have been recorded at various electronic fields for two rotational transitions in the $\tilde{a}^3A_2$-$\tilde{X}^1A_1$ 0-0 bands of H_2CS. Stark splittings were resolved, and were used to determine the dipole moment in the excited electronic state. The value found, 0.57(3) D, is of the order expected by comparison with dipole moments determined for other states of H_2CS, but rather lower than that predicted by ab initio calculations. (18 refs.)

117916 On the nature of the fluorescent state of methylated indole derivatives. S.R.Meech, D.Phillips (Davy Faraday Lab., Royal Instn., London, England), A.G.Lee.
Chem. Phys. (Netherlands), vol.80, no.3, p.317-28 (15 Oct. 1983).
A quantitative study has been made of the solvent effects on the fluorescence properties of 1- and 3-methyl indole, with the aim of further understanding the origin of the unusually large Stokes shift in polar solvents. For the derivatives considered, the fluorescence transition probability is decreased in solvents of moderate and high polarities, and the spectrum shifts to the red. The data (n two-component, solute and solvent, systems) can be interpreted on the basis of the stabilisation, by solvent-solute relaxation, of a state with an increased charge-transfer character, relative to the initially excited state. A consideration of the decay data for other indole derivatives suggests that this state has its origin in the ^1L_a state (S_2 in nonpolar media). Thus the authors conclude that the appropriate label of the fluorescent state of many substituted indoles in polar solvents is ^1L_a/CT. This is consistent with the observed solvent, temperature, time and substituent dependence of the decay kinetics of these derivatives. (48 refs.)

117917 Nonradiative relaxation of singlet oxygen in solution. J.R.Hurst, G.B.Schuster (Dept. of Chem., Univ. of Illinois, IL, USA).
J. Am. Chem. Soc. (USA), vol.105, no.18, p.5756-60 (7 Sept. 1983).
The solvent induced nonradiative relaxation of singlet oxygen ($^1O_2$, $^1\Delta_g$) was examined by directly monitoring infrared phosphorescence following pulsed laser generation. The effects of solvent electronic properties, nuclear spin, oxygen isotope, temperature, and magnetic field were examined systematically. The quenching of $^1O_2$ is related to the energy of the solvent highest frequency mode vibration. A relaxation mechanism based on exchange energy transfer is proposed to accommodate the results. An empirical relationship is developed that permits calculation of the $^1O_2$ lifetime in nonreactive organic solvents. (32 refs.)

117918 5f state interaction with inner coordination sphere ligands: Es^{3+} ion fluorescence in aqueous and organic phases. J.V.Beitz, D.W.Wester, C.W.Williams (Argonne Nat. Lab., Argonne, IL, USA).
J. Less-Common Met. (Switzerland), vol.93, no.2, p.331-8 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
The interaction between the 5f electron states of the Es^{3+} ion and coordinated ligands in solution was probed using laser-induced fluorescence. The aquo-Es^{3+} ion was observed to fluoresce from its first excited J=5 state in a broad band peaking at 9260 cm^{-1}. The observed fluorescence liftimes were 1.05 μs and 2.78 μs in H_2O and D_2O (minimum isotopic purity, 99 at.% D) respectively. The non-radiative decay rates derived from the lifetime data are compared with previously reported data for hydrated Cm^{3+}, Sm^{3+}, Eu^{3+}, Tb^{3+} and Dy^{3+} ions. The 5f actinide states exhibit substantially greater non-radiative decay rates than do lanthanide 4f states with a similar energy gap. This provides evidence that actinide 5f electrons interact more strongly with their inner coordination sphere than do lanthanide ion 4f electrons. The fluorescence lifetime of Es^{3+} complexed with 1 formal (1 g formula weight (1 mol.) dissolved in sufficient solvent to give 1 dm^3 of solution) di(2-ethylhexyl)orthophosphoric acid in n-heptane was 2.34 μs. (16 refs.)

117919 Photodissociation dynamics of triatomic molecules—effect of predissociation on diatomic fragment fluorescence polarization. T.Nagata, T.Kondow, K.Kuchitsu (Dept. of Chem., Univ. of Tokyo, Tokyo, Japan), G.W.Loge, R.N.Zare.
Mol. Phys. (GB), vol.50, no.1, p.49-63 (Sept. 1983).
Calculations are presented for the polarization anisotropy, $R=(I_\parallel - I_\perp)/(I_\parallel + 2I_\perp)$, of the fragment fluorescence ($AB^* \rightarrow AB + h\nu$) when a triatomic molecule (ABC) is photodissociatied by a beam of linearly polarized radiation. Expressions are developed relating the polarization anisotropy to the predissociation lifetime τ of the (ABC*) complex under the assumptions that (1) the motion of the (ABC*) complex can be described by the classical motion of the prolate symmetric top, (2) the AB* excited fragment rotates in the plane of the (ABC*) complex at the time of dissociation and (3) the absorption and emission processes can be described by classical hertzian dipole oscillators. The time averaged autocorrelation function of a free symmetric top, $<D_{mm'}^{(2)}(\delta\Omega(t)))$, is used to find $R(\tau)$ for the dissociation of an (ABC*) complex in a single J,K level and for this quantity averaged over a Boltzmann distribution of J,K levels. (24 refs.)

33.65 PHOTOELECTRON SPECTRA

117920 Calculation of vertical ionization potentials of chloroketene and dichloroketene by perturbation corrections to Koopmans' theorem using an effective core potential. S.R.Langhoff (NASA Ames Res. Center, Moffett Field, CA, USA), D.P.Chong.
Chem. Phys. Lett. (Netherlands), vol.100, no.3, p.259-62 (9 Sept. 1983).
The relatively economical procedure of the combined use of effective core potentials and perturbation corrections to Koopmans' theorem has been applied to chloroketene and dichloroketene. A clearcut assignment of all the bands in the HeI photoelectron spectra is established. (15 refs.)

117921 Non-Koopmans contributions to the photoelectron spectra of *p*-quinodimethane, 3,7-dimethyl-*p*-quinodimethane and tetracyano-*p*-quinodimethane: a limited CI description. R.W.Bigelow (Xerox Webster Res. Center, Webster, NY, USA).
Chem. Phys. Lett. (Netherlands), vol.100, no.5, p.445-9 (23 Sept. 1983).
The low-lying doublet states of the *p*-quinodimethane (**1**) 3,7-dimethyl-*p*-quinodimethane (**2**) and tetracyano-*p*-quinodimethane (TCNQ) (**3**) cations are addressed within the semi-empirical open-shell RHF CNDO/S(CI) formalism. Results indicate that the reduced intensity observed experimentally for the third ionization in both **1** and **2** arises from a pronounced configuration mixing between the parent one-electron Koopmans state and the non-Koopmans HOMO→LUMO valence excitation. Similar contributions are found to account for the relative intensities of the first and second ionization bands (1.0:1.425) in **3**. (32 refs.)

117922 Breakdown in the Koopmans' theorem interpretation of the outer valence-level photoemission spectra of selected organic molecules. R.W.Bigelow (Xerox Webster Res. Center, Webster, NY, USA).
Chem. Phys. (Netherlands), vol.80, no.1-2, p.45-62 (Oct. 1983).
Various final-state manifestations arising from a breakdown in a Koopmans' theorem interpretation of the lower-lying valence level photoemission spectra of benzene *p*-quinodimethane, trans-butadiene, *p*-nitroaniline, trans-stilbene and acrolein are addressed within the semi-empirical open-shell RHF CNDO/S(CI) approximation. The results on benzene, trans-butadiene and *p*-quinodimethane support previous interpretations based on experimental and/or theoretical arguments of pronounced many-body interactions for ionizations between 9 and 14 eV. Computations on *p*-nitroaniline indicate an unusually strong breakdown in the one-particle description of photoionization at ≈10.0 eV due to coupling between appropriate primary hole-states and concomitant one-electron excitations to low-lying virtual levels having considerable localization on the nitro group. The open-shell RHF CNDO/S(CI) energy and projected hole-state distributions yield theoretical photoemission spectra for the molecules considered which offer considerable improvement over the Koopmans' theorem assignment. (76 refs.)

117923 The He (I) and He (II) photoelectron spectra of BIS (2,4,6-tri-*t*-butylphenyl)-diphosphene. B.Cetinkaya, M.F.Lappert, J.G.Stamper, R.J.Suffolk (School of Chem. & Molecular Sci., Univ. of Sussex, Brighton, England).
J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.32, no.2, p.133-7 (Sept. 1983).
Photoelectron spectra of the title compound have been obtained using various ionising radiations. The bands up to ~10 eV have been assigned with the aid of molecular-orbital calculations. (15 refs.)

117924 He (I) and He (II) photoelectron spectra of glycine and related molecules. P.H.Cannington, N.S.Ham (Div. of Chem. Phys., CSIRO, Clayton, Victoria, Australia).
J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.32, no.2, p.139-51 (Sept. 1983).
Photoelectron spectra obtained by He (I) and He (II) excitation of glycine, sarcosine and glycine methyl ester are presented. The *p*-type bands in the He (I) spectrum of glycine are interpreted in terms of localized molecular orbitals; the C 2*s* bands are identified in the He (II) spectrum. He (I) spectra of some *N*-acetylamino acids and of a variety of α- and ω-substituted amino acids and also reported. (29 refs.)

117925 He (I) and He (II) photoelectron investigation of the electronic structure of tropolone and of the related anion ligand. G.Bruno, G.Centineo, E.Ciliberto, I.Fragala (Istituto Dipartimentale di Chimica, Univ. di Catania, Catania, Italy).
J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.32, no.2, p.153-62 (Sept. 1983).
He (I) and He (II) photoelectron spectra of gas-phase tropolone, 2-methoxytropone and the thallium (I) tropolonate complex are reported. Comparison with the PE spectra of related molecules as well as with semiempirical quantum-mechanical calculations are used in making assignments. Remarkable analogies are apparent with the spectrum of the parent molecule tropone. Effects due to intramolecular hydrogen bonding account for some details of the tropolone spectrum. Comparison of the PE spectra of neutral tropolone and of its Tl (I) complex leads to a reasonable description of the electronic structure of the tropolonate anion ligand. (27 refs.)

117926 Vacuum ultraviolet photoelectron spectroscopy of transient species. XVI. The NCO($X^2\Pi$) radical. J.M.Dyke, N.Jonathan, A.E.Lewis, J.D.Mills, A.Morris (Dept. of Chem., Univ. of Southampton, Southampton, England).
Mol. Phys. (GB), vol.50, no.1, p.77-89 (Sept. 1983).
The He (I) photoelectron spectrum of the NCO($X^2\Pi$) radical, produced from the gas phase reaction of atomic fluorine with isocyanic acid, has been recorded. Of the thirteen ionic states accessible from the neutral molecule with He (I) radiation, seven have been observed and assigned using the results of ab initio ΔSCF calculations. Evidence is presented to show that the $X^3\Sigma$ NCO^+ potential energy surface is significantly different from those for the $a^1\Delta$ and $b^1\Sigma^+$ ionic states. The first adiabatic ionization potential of NCO is measured as (11.76 ± 0.01) eV and this leads to an estimate of $D_0(N\text{-}CO^+)$ of (4.40 ± 0.16) eV. From the observed spectra predictions are made of possible electronic transition energies in NCO^+. (36 refs.)

117927 The low-lying cationic hole-states of η^3-allyl tetracarbonyl complexes of Mn and Re—photoelectron spectra and Green's function calculations. M.C.Bohm, R.Gleiter (Organisch-Chem. Inst., Univ. Heidelberg, Heidelberg, Germany), T.A.Albright, V.Sriyunyongwat.
Mol. Phys. (GB), vol.50, no.1, p.113-28 (Sept. 1983).
The electronic structure in the ground state and the low-lying cationic hole states in a series of six η^3-allyl transition metal tetracarbonyl complexes with Mn and Re has been studied by means of molecular orbital calculations and by means of He (I) photoelectron spectroscopy. The computational framework is a semiempirical INDO model. The ionization energies are calculated by means of the Green's function formalism with a second order and a renormalized self-energy approximation. Significant differences in the localization properties of the outer valence orbitals lead to a large deviation in the calculated reorganization energies. Koopman's theorem is invalid in the manganese series. The interrelation between simple fragment molecular orbital models for transition metal complexes and the nature of the low-lying hole states is analysed. (44 refs.)

117928 Electronic and magnetic properties of biliverdinate dimethylester metal(II) compounds [M^{II}(BVDME)] (M=Mn^{II}, Co^{II}, Cu^{II}, Zn^{II}). T.Beringhelli, F.Morazzoni, P.Manitto, D.Monti (Univ. di Milano, Milano, Italy).
Spectrochim. Acta Part A (GB), vol.39A, no.9, p.751-9 (1983).
Biliverdinate dimethylester metal(II) compounds, [M^{II}(BVDME)] (M=Mn^{II}, Co^{II}, Cu^{II}, Zn^{II}), have been characterized by their electronic and magnetic properties. ESR parameters of cobalt and copper compounds are in agreement with a planar structure of coordinated biliverdinate dianion, and the ground state configurations of metals are respectively $(xz \text{ or } yz)^2(yz \text{ or } xz)(x^2-y^2)^2(z^2)^2$ and $(xz)^2(yz)^2\,(x^2-y^2)^2(z^2)^2(xy)$. These configurations well explain the presence of a radical species formulated as biliverdinate dimethylester cobalt(III) radical anion, [Co^{III}(BVDME)]$^{\dot{-}}$, beside the corresponding cobalt(II) compound, [Co^{II}(BVDME)]. The preparation method or the interaction with a solvent can make variations in the amount of the radical form [Co^{III}(BVDME)]$^{\dot{-}}$; dilution by [Zn^{II}(BVDME)] or the presence of base donor solvent (pyridine) completely removes the interaction between Co(III) and (BVDME)$^{\dot{-}}$. A comparison between [Co^{II}(BVDME)] and the cobalt oxygen carriers compounds usually employed as models of the heme proteins leads to conclude that [Co^{II}(BVDME)] does not reduce O_2 to O_2^-, probably because the electron transfer to BVDME ligand successfully competes with that to the O_2 molecule. 33.70 INTENSITIES AND SHAPES OF MOLECULAR SPECTRAL LINES AND BANDS

117929 Radiative lifetime and quenching of SO($b^1\Sigma^+$, $\nu'=0$). J.Wildt, E.H.Fink, R.Winter, F.Zabel (Univ.-Gesamthochschule Wuppertal, Wuppertal, Germany).
Chem. Phys. (Netherlands), vol.80, no.1-2, p.167-75 (Oct. 1983).
Metastable excited SO($b^1\Sigma^+$) radicals were generated by pulse photolysis of SO_2 or $SOCl_2$ using an excimer laser source at 248 nm. Time-resolved measurements of the $b^1\Sigma^+\rightarrow X^3\Sigma^-$ emission yielded a radiative lifetime of $\tau_{rad}=5.7\pm0.8$ ms for the SO($b^1\Sigma^+$, $\nu'=0$) state from which a value of $(5.0\pm0.6)\times10^{-4}$ D^2 is calculated for the square of the transition moment, $|R_e|^2$, of the SO($b^1\Sigma^+\rightarrow X^3\Sigma^-$) transition. Rate coefficients for the quenching of SO($b^1\Sigma^+$, $\nu'=0$) were measured for SO_2, He, Ar, H_2, D_2, N_2, CO, CO_2, and CH_4. The results suggest that in some cases near resonant E→V energy-transfer processes are the major channels in the quenching mechanism. (41 refs.)

117930 Explicit Hilbert-space representations of atomic and molecular photoabsorption spectra: computational studies of Stieltjes-Tchebycheff functions. M.R.Hermann, P.W.Langhoff (Dept. of Chem., Indiana Univ., Bloomington, IN, USA).
Phys. Rev. A (USA), vol.28, no.4, p.1957-73 (Oct. 1983).
Explicit Hilbert-space techniques are reported for construction of the discrete and continuum Schrodinger states required in atomic and molecular photoexcitation and/or photoionization studies. These developments extend and clarify previously described moment-theory methods for determinations of photoabsorption cross sections from discrete basis-set calculations to include explicit construction of underlying wave functions. The appropriate Stieltjes-Tchebycheff excitation and ionization functions of *n*th order are defined as Radau-type eigenstates of an appropriate operator in an *n*-term Cauchy-Lanczos basis. The energies of these states are the Radau quadrature points of the photoabsorption cross section, and their (reciprocal) norms provide the corresponding quadrature weights. Although finite-order Stieltjes-Tchebycheff functions are L^2 integrable, and do not have asymptotic spatial tails in the continuous spectrum, the Radau quadrature weights nevertheless provide information for normalization in the conventional Dirac δ-function sense. Since one Radau point can be placed anywhere in the spectrum, appropriately normalized convergent approximations to any of the discrete or continuum Schrodinger states are obtained from the development. Connections with matrix partitioning methods are established, demonstrating that *n*th-order Stieltjes-Tchebycheff functions are optical-potential solutions of the matrix Schrodinger equation in the full Cauchy-Lanczos basis. 33.80E Autoionization, photoionization, and photodetachment

117931 Double enhancement of the multiphoton ionization of nitric oxide. T.C.Steimle, Huei-Tarng Liou (Chem. Phys. Inst., Univ. of Oregon, Eugene, OR, USA).
Chem. Phys. Lett. (Netherlands), vol.100, no.3, p.300-4 (9 Sept. 1983).
Resonance-enhanced multiphoton ionization (REMPI) of nitric oxide has been investigated at high resolution. A number of doubly-enhanced transitions have been assigned and their transition frequencies measured. The enhancing states are the A $^2\Sigma$ state and high-lying Rydberg states between 65000 and 67000 cm^{-1} in energy. Two-photon transition strengths for the A $^2\Sigma$-$X^2\Pi$ states were calculated and compared with the high-resolution REMPI spectra. (19 refs.)

117932 Shape resonances in the valence-shell photoionization of cyanogen. J.Kreile, A.Schweig, W.Thiel (Fachbereich Phys. Chem., Univ. Marburg, Marburg, Germany).
Chem. Phys. Lett. (Netherlands), vol.100, no.4, p.251-7 (16 Sept. 1983).
Vibrationally-resolved photoelectron angular distributions for the first four valence-shell photoionizations of cyanogen have been measured with Ne I, He I and Ne II line sources. Calculated photoionization cross sections and asymmetry parameters are reported for photon energies up to 50 eV. The experimental and theoretical results indicate the presence of several shape resonances. (46 refs.)

117933 The absorption spectrum resonance structure of diatomic molecules near the ionization threshold. G.V.Goloubkov, G.K.Ivanov (Inst. of Chem. Phys., Acad. of Sci., Moscow, USSR).
Chem. Phys. Lett. (Netherlands), vol.100, no.4, p.358-62 (16 Sept. 1983).
The problem of the near-threshold photoionization of the non-symmetrical molecules XY is formulated in connection with the problem of scattering of the emitted electrons by molecular ions using the integral multichannel quantum defect method and results of the adiabatic approximation. In addition to the general theory, analytical formulae are obtained describing the simplest two-channel cases which demonstrate specific features of interference structure of absorption spectra as well as the role of various factors in the formation of the line profile. (15 refs.)

117934 Two-frequency two-photon ionization of nascent PO($X^2\Pi$) from the collision-free IR photolysis of dimethyl methylphosphonate. J.S.Chou, D.Sumida, C.Wittig (Dept. of Chem., Univ. of Southern California, Los Angeles, CA, USA).
Chem. Phys. Lett. (Netherlands), vol.100, no.5, p.397-402 (23 Sept. 1983).
The authors report the detection of nascent PO produced via the collision-free IR photolysis of dimethyl methylphosphonate. Absorption throughout the $B^2\Sigma^+ \leftarrow X^2\Pi$ system is followed by excitation using 266 nm radiation, which results in $PO^+ + e$. Spectral features due to spin-orbit excitation appear extremely 'cold' relative to vibrations and rotations. (18 refs.)

117935 Electronic spectroscopy of fluorobenzene Van der Waals molecules by resonant two-photon ionization. K.Rademann, B.Brutschy, H.Baumgartel (Inst. fur Phys. Chem., Freien Univ. Berlin, Berlin, Germany).
Chem. Phys. (Netherlands), vol.80, no.1-2, p.129-45 (Oct. 1983).
Van der Waals (vdW) clusters of fluorobenzene (FB), synthesized in a seeded supersonic rare-gas expansion were studied by laser-induced, resonant two-photon ionization (R2PI) combined with TOF mass spectrometry. The molecules were excited near the FB monomer's vibronic origin of the $S_1(\pi\pi^*) \leftarrow S_0$ transition ($\lambda_{00}=2644$ Å). The heterogeneous clusters $FB.Ar_n$ ($n<4$) showed specific shifts of the 0-0 band relative to λ_{00} induced by vdW interaction (FB.Ar: -23 cm^{-1}; $FB.Ar_2$: -46 cm^{-1}; $FB.Ar_3$: $+4.6$ cm^{-1}). Additional satellite bands appeared due to intermolecular photofragmentation. A second band found for FB.Ar at 20 cm^{-1} was assigned to a vdW vibration ($\nu_{vdW}=43$ cm^{-1}). Similar results were obtained for $FB.Kr_n$ ($n<3$). The spectra of the homogeneous clusters FB_2 and FB_3 were more complex. The dimer spectrum showed two broad spectral features, one blue-the other red-shifted relative to λ_{00}. Each one is probably due to a different isomer. (48 refs.)

117936 Autoionization spectra of Li_2 and the $X^2\Sigma_g^+$ ground state of Li_2^+: experimental and theoretical investigations. D.Eisel, W.Demtroder (Fachbereich Phys., Univ. Kaiserslautern, Kaiserslautern, Germany), W.Muller, P.Botschwina.
Chem. Phys. (Netherlands), vol.80, no.3, p.329-44 (15 Oct. 1983).
Autoionizing Rydberg levels of Li_2 molecules in a supersonic molecular beam are populated by stepwise exciton with two tunable pulsed dye lsers. The observed autoionization spectra show severe perturbations. Based on calculations of quantum defects and a perturbation treatment of l-uncoupling a tentative assignment of Rydberg series up to $n=32$ is proposed. The convergence limits of these series yield a value of IP-41475 cm^{-1} for the adiabatic ionization potential and a vibrational constant $\omega_e=263$ cm^{-1} for the $X^2\Sigma_g^+$ ground state of Li_2^+. The experimental results are compared with ab initio calculations combined with a core polarization potential, which yield the potential curve, the dissociation energy, the quadrupole moment and the vibrational frequency for the $X^2\Sigma_g^+$ ground state of Li_2^+, in excellent agreement with experimental findings. (43 refs.)

117937 Angular distribution for the major photoelectron bands of nitrogen below 45 eV binding energy. F.A.Grimm (Dept. of Chem., Univ. of Tennessee, Knoxville, TN, USA), T.A.Carlson.
Chem. Phys. (Netherlands), vol.80, no.3, p.389-94 (15 Oct. 1983).
Measurements on the angular-distribution parameter, β, for photoionisation from the $3\sigma_g$, $1\pi_u$ and $2\sigma_u$ orbitals of nitrogen have been extended to a photon energy of 70 eV. At the higher photon energies the agreement between theory and experiment is improved over that obtained at lower photon energies. The angular-distribution parameter for photonization from the $2\sigma_g$ orbital (≈ 38 eV) and the main satellite band at 29 eV are reported for the first time. The angular-distribution parameter, as measured over the 38 eV band, is consistent with two or more transitions to $^2\Sigma_g^+$ states which obtain their intensity from a $(2\sigma_g)^{-1}$ hole configuration. Results for the $2\sigma_g$ inner valence band at 38 eV are also consistent with one-electron continuum multi-scattering $X\alpha$ calculations. The major features of the inner valence region (20-45 eV) may be explainable using an excited-state molecular-orbital picture coupled to the outermost valence orbitals. (14 refs.)

117938 Optical absorption, electron spin resonance, and electron spin echo studies of the photionization of tetramethylbenzidene in cationic and anionic synthetic vesiscles: comparison with analogous micellar systems. A.S.W.Li, L.Kevan (Dept. of Chem., Univ. of Houston, Houston, TX, USA).
J. Am. Chem. Soc. (USA), vol.105, no.18, p.5752-5 (7 Sept. 1983).
The photoionization of *N,N,N′,N′*-tetramethylbenzidine (TMB) in dihexadecylphosphate anionic vesicles and in dioctadecyldimethylammonium chloride cationic vesicles has been studied by optical absorption and electron spin resonance in liquid and frozen solutions. The TBM cation has been observed to be stabilized in both types of vesicles. The photionization efficiency is about twofold greater in the cationic vesicles compared to the anionic vesicles. Shifts in the optical absorption maximum between micellar and vesicle solutions indicate that TMB is in a less polar environment in the vesicle systems. Electron spin echo modulation spectrometry has been used to detect TMB cation-water interactions that are weaker than in previously studied micellar solutions. This is consistent with the optical absorption results and with an asymmetric solubilization site for TMB and TMB^+ within the vesicular structure. A new absorption in the photoionized vesicles is assigned to a nonparamagnetic diamine-diimine charge-transfer complex between two TMB cations in the same vesicle. This complex is not formed in micellar systems. (19 refs.)

117939 Study of $L_{2,3}M_{4,5}M_{4,5}$ Auger spectra of Zn and Cu in molecular $ZnCl_2$ and $(CuCl)_3$ vapours. S.Aksela, M.Kellokumpu, M.Harkoma (Phys. Dept., Univ. of Oulu, Oulu, Finland).
J. Electron Spectrosc. & Relat. Phenom. (Netherlands), vol.32, no.2, p.177-87 (Sept. 1983).
$L_{2,3}M_{4,5}M_{4,5}$ Auger electron spectra of Zn and Cu have been measured in molecular $ZnCl_2$ and $(CuCl)_3$ vapours. The spectra have been analyzed and compared with the corresponding free-atom spectra. It is found that the main features of the spectra are atomic-like. The energies are shifted by 0.55 eV in $ZnCl_2$ and by 3.2 eV in $(CuCl)_3$ towards higher kinetic energy compared with the corresponding free-atom spectra. For the intensity ratios between the L_3 and L_2 groups, the values 2.8 and 3.7 are obtained for Zn and Cu, respectively. These intensity ratios, together with energy considerations based on free-atom Dirac-Fock calculations and observed Auger shifts, indicate that the $L_2L_3M_{4,5}$ Coster-Kronig process is energetically possible in $(CuCl)_3$ molecular clusters but not in $ZnCl_2$. The satellite structure in the spectra studied also supports this conclusion. (15 refs.)

117940 Determination of rotational alignment of $N_2^+B^2\Sigma_u^+$ and $CO^+B^2\Sigma^+$ following photoionization of N_2 and CO. J.A.Guest, K.H.Jackson, R.N.Zare (Dept. of Chem., Stanford Univ., Stanford, CA, USA).
Phys. Rev. A (USA), vol.28, no.4, p.2217-28 (Oct. 1983).
When a low-pressure (10^{-2}-Torr) sample of N_2 or CO is exposed to a beam of linearly polarized synchrotron radiation (18-34 eV), electronically excited molecular ions are formed whose subsequent unresolved emission is found to be partially polarized. The degree of polarization of the $N_2^+ B^2\Sigma_u^+ - X^2\Sigma_g^+$ fluorescence (~ 391 nm) and the $CO^+ B^2\Sigma^+ - X^2\Sigma^+$ fluorescence (~ 220 nm) is studied as a function of the energy of the ionizing radiation from threshold to higher energies. This information determines the alignment of the photoion, which in the case of N_2 must be corrected for depolarization caused by spin-rotation and hyperfine interaction. From the polarization of the fluorescence the authors deduce γ, the ratio of parity-unfavored to the sum of parity-favored contributions for photoelectron ejection. Comparison of the dynamical channel ratio γ with theoretical calculations for σ- and π-photoelectron ejection shows poor agreement for N_2 and fair agreement for CO. (45 refs.)

33.80G Diffuse spectra; predissociation, photodissociation

117941 Photofragmentation of HI in the first continuum. G.N.A.Van Veen, K.A.Mohamed, T.Baller, A.E.De Vries (FOM-Inst. for Atomic & Molecular Phys., Amsterdam, Netherlands).
Chem. Phys. (Netherlands), vol.80, no.1-2, p.113-20 (Oct. 1983).
Time-of-flight (TOF) spectra and the angular distributions of H atoms resulting from the photofragmentation of HI at 248 nm, 222 nm and 193 nm have been measured. The ratio for $I(^2P_{1/2})$ and $I(^2P_{3/2})$ formation and the symmetries of the repulsive excited states were obtained. From this information the potential-energy curves of the relevant excited states were calculated by means of the modified δ approximation. With these potential curves the $I(^2P_{1/2})/I(^2P_{3/2})$ ratio was deduced for DI. The thus calculated ratios for DI are in excellent agreement with the values known from the literature. (20 refs.)

117942 Comparison of photon-stimulated dissociation of gas-phase, solid and chemisorbed water. D.E.Ramaker (Surface Sci. Div., NBS, Washington, DC, USA).
Chem. Phys. (Netherlands), vol.80, no.1-2, p.183-202 (Oct. 1983).
Recent electron- and photon-stimulated desorption (ESD/PSD) data for H_2O in the condensed phase and chemisorbed on GaAs (110) and Ti (001) are interpreted utilizing previously published photoemission, electron coincidence and Auger data along with theoretical calculations. Comparison with fragmentation data from the gas phase indicates that only two hole-one electron type states are effective for desorption in condensed or molecularly chemisorbed hydrogen bonded water. The $1b_2^{-1}$ excitation, which effectively dissociates H_2O gas via predissociation, is ineffective in the condensed phase because of the presence of intermolecular decay mechanisms which compete with the predissociation process. Hydrogen bonding reduces the effectiveness of the '$2a_2^{-1}$' excitation for H^+ desorption. The $1b_1^{-2}4a_1$ and $1b_1^{-1}3a_1^{-1}4a_1$ two hole-one electron states are sufficiently long lived; occupation of the strongly antibonding $4a_1$ orbital also makes them repulsive. (102 refs.)

117943 Infrared-enhanced multiphoton dissociation of iodobenzene cations. N.B.Lev, R.C.Dunbar (Chem. Dept., Case Western Reserve Univ., Cleveland, OH, USA).
Chem. Phys. (Netherlands), vol.80, no.3, p.367-78 (15 Oct. 1983).
When gas-phase iodobenzene cations in an ion cyclotron resonance spectrometer are irradiated simultaneously with visible 610 and IR 977 cm^{-1} photons, the visible two-photon process is enhanced by a factor of up to three. The experimental pressure and intensity dependence can be modeled using a set of rate equations for the evolution of the populations of different internal energy levels. Modeling suggests that the major mechanism for the mixed visible/IR process is the absorption of several IR photons, followed by the absorption of one visible photon which brings about dissociation; that the visible photoexcitation cross section decreases with increasing ion internal energy; that IR pumping does not compete successfully with relaxation processes near dissociation threshold; and that the IR radiative relaxation time is constant ≈ 500 ms. (23 refs.)

117944 Role of coherence in multiquantum excitation of molecules by IR laser radiation. A.M.Samson, V.A.Savva, G.K.Paramonov.
J. Appl. Spectrosc. (USA), vol.38, no.1, p.63-72 (Jan. 1983). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.38, no.1, p.76-87 (Jan. 1983).
The authors show that when coherence of the excitation is included, there are qualitative changes occurring in the system. Under collisionless conditions, when neither energy nor phase relaxation is present, a multilevel system with degenerate levels is excited in a completely different manner than a one-dimensional multilevel system. 33.80K Multiphoton processes

117945 The effect of added nitrogen on multiphoton absorption by ammonia. I.M.Waller, D.K.Evans, R.D.McAlpine (Chalk River Nuclear Labs., AECL, Chalk River, Ontario, Canada).
Appl. Phys. B (Germany), vol.B32, no.2, p.75-8 (Oct. 1983).
Multiphoton absorption (MPA) of the CO_2 laser 9 μm $R(30)$ line (pulse width 60 ns, FWHM) by NH_3 and NH_3/N_2 mixtures was studied as a function of gas composition, pressure and laser fluence (ϕ). MPA occurs for values of ϕ which are less than the values that have been used for optically pumped NH_3/N_2 lasers; consequently a simple two-level absorption model will not adequately describe laser action in these systems. The photon energy deposited in NH_3/N_2 mixtures can be calculated from the MPA cross-section and the fluence dependence of the illumination geometry. An examination of the efficiency of conversion of this absorbed energy to the reported radiant energy of optically pumped NH_3/N_2 lasers shows an optimum value which depends on pressure, and gas composition. (21 refs.)

117946 Intensity dependence of CO_2-laser-induced multiphoton absorption and decomposition of monomethylamine. D.K.Evans, R.D.McAlpine, H.M.Adams, A.L.Greagh (AECL, Chalk River Nuclear Labs., Chalk River, Ontario, Canada).
Chem. Phys. (Netherlands), vol.80, no.3, p.379-88 (15 Oct. 1983).
The infrared multiphoton absorption (MPA) and decomposition (MPD) of monomethylamine have been studied using temporally smooth CO_2-laser pulses of 6, 9 and 40 ns fwhm. Both MPA and MPD depend on gas pressure (0.267-1.33 kPa) at each pulse width; but results for different pulse widths did not simply scale with collision number. At each pressure, MPA and MPD depend on laser-pulse intensity as well as fluence confirming the suggestion of previous workers. (28 refs.)

117947 Multiphoton transitions in gases at microwave frequencies. G.Alzetta, A.Battaglia (Dipartimento di Fisica, Univ. di Pisa, Pisa, Italy).
J. Phys. Lett. (France), vol.44, no.18, p.L755-9 (15 Sept. 1983).
Multiphoton transitions are produced irradiating a gas by two microwave power sources. Three-photon transitions in NH_3 and OCS have been studied as a function of frequency, power and density of gases. Measurements agree fairly well with theoretical predictions. (3 refs.)

117948 Chaos in multiple-photon excitation of molecules. J.R.Ackerhalt, H.W.Galbraith (Los Alamos Nat. Lab., Los Alamos, NM, USA), P.W.Milonni.
Phys. Rev. Lett. (USA), vol.51, no.14, p.1259-61 (3 Oct. 1983).
With use of a Hamiltonian model system to represent IR laser excitation of a molecule it is shown that chaos is a fundamental aspect of this physical process. On average the chaos leads to a fluence-dependent absorption which previously was attributed to rapid statistical equilibration of energy in the quasicontinuum and was modeled by population rate equations. The origin of the chaos is the interplay of the pump mode's anharmonicity and intramolecular energy transfer. (7 refs.)

117949 Spectral characteristics of the excitation of SF_6 molecules by an intense infrared laser field under strong cooling conditions. S.S.Alimpiev, N.V.Karlov, S.M.Nikiforov, A.M.Prokhorov, B.G.Sartakov, E.M.Khokhlov, A.L.Shtarkov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.331-5 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.562-9 (March 1983). [received: Oct. 1983]
A study was made of the fine structure of the excitation of the lower vibrational levels in SF_6 molecules gasdynamically cooled to temperatures of the order of 30K. A two-frequency infrared-infrared laser excitation method was employed. A continuously tunable CO_2 laser was found for the first stage. At a frequency of 944.39 cm^{-1} a contrast absorption peak was detected, having a width of less than 0.1 cm^{-1} and corresponding to the A_{1g} two-photon resonance. (17 refs.)

34.00 ATOMIC AND MOLECULAR COLLISION PROCESSES AND INTERACTIONS

34.10 GENERAL THEORIES AND MODELS

(inc. statistical theories, transition state, stochastic and trajectory models, etc; see also 82.20)

117950 Analytical molecular surface calculation. M.L.Connolly (Dept. of Molecular Biology, Res. Inst. of Scripps Clinic, La Jolla, CA, USA).
J. Appl. Crystallogr. (Denmark), vol.16, pt.5, p.548-58 (1 Oct. 1983).
A computer algorithm is presented for calculating the part of the van der Waals surface of a molecule that is accessible to solvent. The solvent molecule is modeled by a sphere. This sphere is, in effect, rolled over the molecule to generate a smooth outer-surface contour. This surface contour is made up of pieces of spheres and tori that join at circular arcs. The spheres, tori and arcs are defined by analytical expressions in terms of the atomic coordinates, van der Waals radii and the probe radius. The area of such surface piece may be calculated analytically and the surface may be displayed on either vector or raster computer-graphics systems. These methods are useful for studying the structure and interactions of proteins and nucleic acids. (16 refs.)

34.20 INTERATOMIC AND INTERMOLECULAR POTENTIALS AND FORCES

(for molecular solids, see 31.70K)

117951 Investigation of particularities found in intermolecular interaction for glycerine solutions with ordinary and heavy water through acoustic methods. V.N.Hudaiberdyev (Thermophys. Dept., Acad. of Sci., Tashkent, USSR).
Acta Phys. Slovaca (Czechoslovakia), vol.33, no.5-6, p.275-82 (1983).
Acoustic methods are presented for investigating the structure and the mechanisms of intermolecular interactions in glycerine solutions with ordinary and heavy water. The volume and shear relaxation has been found for the investigated systems. The molecular mechanisms are suggested to re-arrange the structure of glycerine and its water solutions based upon certain relaxation and thermal properties peculiar to the discovered acoustic dispersion fields, as well as upon the high resolution electron spin resonance (ESR) and the nuclear magnetic resonance (NMR) spectra analysis. The particularity of the glycerine water solution structures (the glycerine concentration was equal to 0.3 mol.%) has been attributed to a higher compactibility and stability of water solutions conditioned by the specified character of the formation and the breakage of intermolecular hydrogen bonds in the glycerine associators and its water complexes. (9 refs.)

117952 Calculation of forces of molecular interaction of metals in vacuum over a broad region of distances. Ya.I.Rabinovich (Inst. of Phys. Chem., Acad. of Sci., Moscow, USSR).
Colloid J. USSR (USA), vol.44, no.6, p.964-9 (Nov.-Dec. 1982). Translation of: *Kolloidn. Zh. (USSR)*, vol.44, no.6, p.1096-101 (Nov.-Dec. 1982). [received: Sept. 1983]
On the basis of the macroscopic theory of molecular forces, approximate analytical formulae have been derived for the calculation of the specific energy and forces of interaction (disjoining pressure) of two metals separated by a plane-parallel air gap, in the transition region and in the region of large distances. With $2 \leq H \leq 1000$ nm, the results of the calculations based on the proposed formulas are within 10% of the results obtained in computer calculations using the original formulas of the macroscopic theory. (12 refs.)

117953 An analytic method for the calculation of electrostatic molecular potentials. M.J.Ramos, B.Webster (Dept. of Chem., Univ. of Glasgow, Glasgow, Scotland).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.9, p.1389-98 (Sept. 1983).
A new analytic method is presented for the calculation of the electrostatic potential of any molecule. Analytic expressions are given for *s*- and *p*-type gaussian functions and the source for expressions involving *d*-type gaussian functions is noted. The use of Slater functions requires a representation by a gaussian expansion. An extension of the theory is made for contracted gaussian functions. Isopotential maps are shown for several small molecules. (7 refs.)

117954 An initio calculation of the Heisenberg exchange interaction between O_2 molecules. M.C.van Hemert (Vakgroep Fysische en Macromoleculaire Chem., Rijksuniv. Leiden, Leiden, Netherlands), P.E.S.Wormer, A.van der Avoird.
Phys. Rev. Lett. (USA), vol.51, no.13, p.1167-70 (26 Sept. 1983).
The exchange interaction between ${}^3\Sigma_g{}^- O_2$ molecules, as obtained from ab initio calculations for a singlet, triplet, and quintet dimer, can be well represented by the Heisenberg Hamiltonian. The coupling parameter J depends exponentially on the O_2-O_2 distance, with exponents ranging from 3.6 to 4.2 $Å^{-1}$ for different O_2 orientations. For most orientations the coupling is antiferromagnetic, but for a few J is positive. The different neighbor interactions in α and β O_2 solids, which determine their magnetic order and properties, have been evaluated. (24 refs.)

117955 Vibrational interaction potentials. Y.von Bergen, R.von Bergen (Dept. of Chem., Simon Bolivar Univ., Caracas, Venezuela), B.Linder.
Theor. Chim. Acta (Germany), vol.63, no.4, p.317-22 (1983).
An expression is derived for the interaction potential arising from the correlative vibrational motion of fluctuating dipolar diatomic molecules, using as model the Morse oscillator. The theory is applied to two interacting NaCl molecules. The vibrational dipole-dipole coefficient, C_6, is strongly temperature dependent with a value at room temperature of 3.788×10^{-62} erg cm^6. (7 refs.)

117956 Semiclassical calculation of lower potential curves of hydrogen ion. N.V.Semenova.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.72-6 (Aug. 1983). In Russian.
The comparison equation method is used for investigating lower potential curves of the hydrogen molecular ion. This method significantly improves existing semiclassical results in some ranges of internuclear distance. (15 refs.)

117957 Investigations on the thermionic diode: the ionisation probability of Rb n^2P_J atoms by noble gas collisions. K.Niemax (Inst. fur Experimentalphys., Univ. Kiel, Kiel, Germany).
Appl. Phys. B (Germany), vol.B32, no.2, p.59-62 (Oct. 1983).
By using the frequency-doubled light of a single-mode dye laser the effect of noble gas collisions (Ne and Xe) on the intensities of the Rb principal series lines $5S-nP$ ($n\geq15$) has been studied in a thermionic diode. The signal intensities of the low-lying lines of the series could be increased considerably by applying higher noble-gas pressures. The intensities of the high-lying lines were found to be pressure independent indicating a constant ionisation probability of highly excited atoms by collisions. By comparing the diode signals of the discrete lines with the ionisation continuum it is shown that the ionisation probability of high-lying levels is unity within the experimental error. (19 refs.)

117958 The quenching of anthracene triplets by ground-state anthracene. J.Saltiel, G.R.Marchand, R.Dabestani, J.M.Pecha (Dept. of Chem., Florida State Univ., Tallahassee, FL, USA).
Chem. Phys. Lett. (Netherlands), vol.100, no.3, p.219-22 (9 Sept. 1983).
The first-order decay constant, k_{dt}, of anthracene triplets, $^3A^*$, in benzene depends linearly on ground-state anthracene, ^1A, concentration: $k_{\mathrm{dt}}=k_{\mathrm{d}}{}^{0}{}_{\mathrm{t}}+k_{\mathrm{sq}}[^1A]$, where $k_{\mathrm{d}}{}^{0}{}_{\mathrm{t}}=49\pm12\ s^{-1}$ and $k_{\mathrm{sq}}=(3.19\pm0.10)\times10^5\ M^{-1}\ s^{-1}$ at 23°C. The actual involvement of ^1A in the quenching process is unequivocally established by varying $[^1A]$ in situ through a sequence of partial photodimerization steps. The temperature dependence of k_{sq} being normal, $k_{\mathrm{sq}}=3.89\times10^8\ \exp(-4.19/RT)$, while not precluding it, does not require formation of triplet anthracene excimer. Less extensive but similar results are reported with cyclohexane and ethanol as solvents. (19 refs.)

117959 Collisional relaxation of backward photon echo in molecular sodium. S.Asaka, H.Yamada, H.Nakatsuka, M.Matsuoka (Dept. of Phys., Kyoto Univ., Kyoto, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3029-38 (Sept. 1983).
Backward photon echo and its decay were observed in the $X\Sigma$-$A\Sigma$ transition of Na_2 undergoing collisions with Ar buffer gas. By using the quantum mechanical transport equation, expressions of the various collisional cross sections are presented. The results are applied to the experiment, and several kinds of cross sections are obtained for the Na_2-Ar system. Furthermore by assuming the Gaussian collision kernel, two parameters of the population kernel are derived for the $Na_2(X\Sigma)$-Ar collisions.

117960 Time evolution of ion swarm transport in a constant mean free time encounter region. T.Makabe, K.Misawa, T.Mori (Dept. of Electrical Engng., Keio Univ., Yokohama, Japan).
J. Phys. D (GB), vol.16, no.10, p.1893-900 (14 Oct. 1983).
Ion swarm transport is simulated by a Monte Carlo technique in the case of a constant mean free time collision model with isotropic scattering after the ions have been released into a gas with a δ-function distribution in space and a steady-state velocity distribution. The time behaviour of the transport coefficients is investigated for ion-molecule mass ratios m/M of 0.1, 1.0 and 10 under the condition that the field energy is one hundred times greater than the thermal energy. In particular, discussion is given for the skewness and excess of the density distribution. It is also shown that these higher-order coefficients become increasingly important with decreasing m/M. (10 refs.)

117961 Quasienergetic method in the theory of opticocollisional transitions. P.A.Apanasevich, A.P.Nizovtsev.
J. Appl. Spectrosc. (USA), vol.38, no.1, p.1-16 (Jan. 1983). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.38, no.1, p.5-21 (Jan. 1983).
The authors outline a general method—the method of particles 'covered' by the field—which allows the various opticocollisional transitions to be considered from a single viewpoint. One- and two-photon bound-bound transitions in weak and strong fields are considered in detail. The cross sections of such transitions are found, and their dependence on the characteristics of the radiation is analysed. (40 refs.)

117962 Close-coupling calculations of polarized rotational cross sections for (Ar, LiF). D.W.Davies (Dept. of Chem., Univ. of Birmingham, Birmingham, England).
Mol. Phys. (GB), vol.50, no.1, p.229-41 (Sept. 1983).
Close-coupling calculations with 121 channels at an energy of 155 cm^{-1} have been made for the rotational scattering of LiF by Ar, using a Lennard-Jones type potential with long range anisotropic terms. Integral cross sections for transitions $(jm_j)\rightarrow(j'm_j)$ are given for $j=0,1,2,3,4$ and $j'=0,1,2,3,4,5$, and also for the $j=0\rightarrow8$ and $j=0\rightarrow10$ transitions. Differential cross sections were obtained for $\Delta j=1$ and $j=0,1,2,3$, and for $j=1\rightarrow1$, $1\rightarrow3$, $0\rightarrow2$ and $3\rightarrow3$ transitions. Rotated scattering amplitudes were used to obtain integral cross sections by numerical integration, but these show little evidence that for $\Delta j\neq0$ the $\Delta m=0$ transition has a relatively large cross section along an axis perpendicular to the bisector of the angle betwen the initial and final relative velocity vectors. Certain rules for Δm are suggested, and a comparison with experimental results for (Ar, LiF) and (Ar, CsF) is given. (33 refs.)

117963 First observation of the Thomas peak in continuum capture: capture of H atoms from CH_4 molecules by fast Ar^+ projectiles. M.Breinig, G.J.Dixon, P.Engar, S.B.Elston, I.A.Sellin (Univ. of Tennessee, Knoxville, TN, USA).
Phys. Rev. Lett. (USA), vol.51, no.14, p.1251-4 (3 Oct. 1983).
Energy spectra of protons emerging near the forward direction for 100-300-eV/u Ar^+ beams incident on CH_4 were recorded. Cross sections for the capture of H atoms from CH_4 molecules into states lying in the vibrational continuum of the electronic ground state and into predissociative states of ArH^+ molecules were measured as a function of projectile energy. Capture occurs via the Thomas double-scattering mechanism. (21 refs.)

117964 Molecular treatment of charge transfer in Li^++Ca collisions. M.Kimura, H.Sato, R.E.Olson (Dept. of Phys., Univ. of Missouri, Rolla, MO, USA).
Phys. Rev. A (USA), vol.28, no.4, p.2085-90 (Oct. 1983).
The perturbed-stationary-state method, appended with electron translation factors, has been applied to charge transfer in Li^++Ca collisions for energies from 0.1 to 20 keV/amu. The Born-Oppenheimer wave functions and eigenvalues were generated using the pseudopotential technique, which reduced the many-electron system to a simpler two-electron problem. The molecular ground-state $X^1\Sigma^+$ is calculated to be bound and has the potential-well parameters $R_e=6.20a_0$, $D_e=1.11$ eV, $\omega_e=235\ cm^{-1}$, and $B_e=0.263\ cm^{-1}$. From the scattering computations, a representative value for the charge-transfer cross section is $4\times10^{-15}\ cm^2$ at 5 keV/amu. The cross section decreases rapidly as the energy is reduced below 1 keV/amu. At all energies studied, the dominant electron-capture reaction product is the ground-state Li atom. (21 refs.)

117965 Proton-stopping power of argon, krypton, and xenon. E.J.McGuire (Sandia Nat. Labs., Albuquerque, NM, USA).
Phys. Rev. A (USA), vol.28, no.4, p.2096-103 (Oct. 1983).
Parameters for the Bethe stopping-power theory for Ar, Kr, and Xe are obtained both via integration over optical oscillator strengths and from explicit plane-wave Born-approximation calculations. The former procedure produces a Bethe mean excitation energy (I) significantly lower than that measured, while the latter procedure produces I values within 10 eV of the measured values for Ar and Kr. For Xe the experimental I value lies midway between the two calculated I values. Inner-shell corrections are obtained from the explicit calculations. The K-shell corrections (C_K) are a factor of 2 larger than those obtained from hydrogenic calculations. The total inner-shell correction ($\Sigma_{nl}\ C_{nl}$) is in qualitative agreement for Ar, Kr, and Xe with results from a statistical model. However, the quantitative difference between the two sets of inner-shell corrections leads to significant increases in I values inferred from experimental measurements below 1 MeV proton energy. (17 refs.)

117966 $N_2{}^+$ first-negative emission cross sections for low-energy H^+ and H impact on N_2. B.Van Zyl, M.W.Gealy, H.Neumann (Dept. of Phys., Univ. of Denver, Denver, CO, USA).
Phys. Rev. A (USA), vol.28, no.4, p.2141-50 (Oct. 1983).
Absolute emission cross sections for the (0,1), (1,2) and (2,3) band emission sequence of the $N_2{}^+$ first-negative system have been measured for low-energy H^+ and H collisions with room-temperature N_2 molecules. The energy range covered for H^+ impact was from 63 eV to 2.0 keV, and that for H impact was from 160 eV to 2.5 keV. For $H+N_2$ collisions, cross sections for N_2 second-positive emissions for the (1,5) and (2,6) emission bands were also determined. The total cross sections for production of $N_2{}^+(B)$ and $N_2(C)$ were determined from these measured results. The techniques used to accomplish the measurements are described, and the cross sections obtained are compared with the results of other investigations. (44 refs.)

117967 Effective cross section for depolarization of an alkali metal atom in a collision with an alkali halide molecule. O.S.Vasyutinskii (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).
Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.560-1 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1302-5 (Nov. 1982). [received: Sept. 1983]
Reports a determination of the effective cross section for the depolarization of cesium atoms in collisions with CsI molecules. The interest in this subject stems from the possibility of obtaining important information about the mechanisms for atom-atom and atom-molecule collisions—information which is difficult to obtain by other methods. Previous research, however, has been restricted to materials which cause an extremely slight depolarization of atoms oriented in their ground state, because of the difficulty in arranging direct optical orientation of alkali metals under strong-relaxation conditions. In the present experiments, oriented cesium atoms are produced by irradiating a vapor of alkali halide molecules (CsI) by circularly polarized ultraviolet light. The mechanism involved is the orientation of the atoms during the photodissociation of the molecules. The effective depolarization cross section is determined by measuring the linewidth of the magnetic-resonance signal in the ground state of the atoms oriented in this manner. (8 refs.)

117968 Vibrational effects with excitation transfer in metastable rare-gas-halide collisions. M.S.De Vries, R.M.Martin (Dept. of Chem., Univ. of California, Santa Barbara, CA, USA).
Chem. Phys. (Netherlands), vol.80, no.1-2, p.157-65 (Oct. 1983).
Collisions of $Ar(^3P_{2,0})$ and $Kr(^3P_{2,0})$ with Cl_2 and Br_2 were studied over the collision energy range 0.01-0.5 eV, using a crossed-beam time of flight technique. The dependence of the total chemiluminescence cross sections (from excimer formation plus excitation transfer) on collision energy follows the behavior expected from the orbiting-controlled curve-crossing model. The energy dependence for excitation transfer does not follow this model, and is quite different for Cl_2 versus Br_2. These results are explained by a phase-matching curve-crossing model, in terms of the $A^+/X_2{}^-$ trajectory motion and the phase of the $X_2{}^-$ vibrational motion. (25 refs.)

117969 Semiclassical calculation of energy transfer in polyatomic molecules. IX. Cross sections for $M+CO_2\ (000)\rightarrow M+CO_2(nml)$ (M=He and Ar). G.D.Billing (Dept. of Chem., Panum Inst., Copenhagen, Denmark), D.C.Clary.
Chem. Phys. (Netherlands), vol.80, no.3, p.213-19 (15 Oct. 1983).
Cross sections for exciton of the asymmetric-stretch vibrational manifold of CO_2 in collision with He and Ar have been calculated using a semiclassical

collision method and a potential-energy surface constructed from self-consistent field data. The cross sections for collisional energies up to 2.0 eV are compared with those obtained in a molecular-beam experiment. (15 refs.)

117970 Elastic collision cross sections for laser-induced diffusion. N.M.Lawandy (Div. of Engng., Brown Univ., Providence, RI, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.8, p.1257-8 (Aug. 1983).
The author presents a method for estimating the change in the hard sphere collision cross section for a polyatomic molecule associated with vibrational excitation. The final result is only related to spectroscopic and virial coefficient data. The ability to theoretically estimate this cross section change is vital to the theoretical modeling of light-induced drift separation schemes in polyatomic mixtures. (9 refs.)

117971 Dipolar transitions induced by collisions with formaldehyde molecules. Electric field effects. J.-C.Chardon, C.Genty, E.K.Hlil, J.-C.Labrune (Lab. de Spectroscopie Hertzienne et d'Electronique, Besancon, France).
J. Phys. (France), vol.44, no.10, p.1149-56 (Oct. 1983).
Using a H_2CO molecular beam, a method is first described which permits the observation of rotational transitions $\Delta J = \pm n(n \geq 1)$, induced by collisions with the molecules of a target gas. In the case $H_2CO \rightarrow H_2CO$, selection rules are defined and rotational resonance effects are observed on the differential cross sections for some $\Delta J = -1$ transitions. It appears that a direct electric field E considerably modifies the H_2CO cross sections σ_J. Using the pair $H_2CO \rightarrow NH_3$, the study of σ_J variations with E shows that the $\Delta J = 0$ transitions become forbidden, when E is intense. The experimental results are compared with the theoretical transition probabilities variations due to E and calculated in the Born approximation. An experimental method is deduced which permits, by application of an electric field, to select $\Delta J = 0$ transitions on a molecular beam. (24 refs.)

117972 Effects of quantum flux on the relaxation of paired modes of the CO_2 molecule. V.N.Faizulaev.
J. Appl. Mech. & Tech. Phys. (USA), vol.23, no.6, p.738-43 (Nov.-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR)*, vol.23, no.6, p.9-14 (Nov.-Dec. 1982). [received: Sept. 1983]
Previously, a solution was found to the relaxation problem for anharmonic oscillators that incorporates the quantum flux excited by V-V exchange under nonequilibrium conditions. The present author makes a more detailed study of the vibrational kinetics of paired CO_2 modes using this method. (13 refs.)

117973 Determination of the relaxation time of the 103 H_2O vibration with an optoacoustic spectrometer and a ruby laser. B.G.Ageev, O.Yu.Nikiforova, Yu.N.Ponomarev (Inst. of Atmospheric Optics, Acad. of Sci., Tomsk, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.361-3 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.608-11 (March 1983). [received: Oct. 1983]
A method was developed for the determination of the vibrational-translational (*VT*) relaxation time of gases, based on the dependence of the sensitivity of an optoacoustic detector on the pressure of the investigated gas in a cell under pulse excitation conditions. An optoacoustic spectrometer and a pulsed ruby laser were used to determine the relaxation time of the 103 vibration in H_2O vapor. The value obtained, $\tau_{VT}(103) = (2.1 \pm 0.4) \times 10^{-7}$ sec.atm, was in qualitative agreement with the results of an experimental determination of the *VT* relaxation time of the lower H_2O vibration modes (010, 100, 001, 020). (15 refs.)

34.50H Electronic excitation and ionization (inc. beam-foil excitation and ionization)

117974 Collisional excitation of SF_6 and WF_6 by superthermal K. G.W.Black, M.A.D.Fluendy, S.L.Lunt (Dept. of Chem., Univ. of Edinburgh, Edinburgh, Scotland).
Mol. Phys. (GB), vol.50, no.1, p.153-9 (Sept. 1983).
Differential inelastic scattering cross sections have been measured for the systems $K + SF_6$, WF_6. Only weak excitation is seen in the neutral scattering. The gateway mechanism operating in these collisions is discussed. (19 refs.)

117975 Impact-parameter dependence of energy loss in light ions scattering by a gold atom. G.A.Iferov, V.A.Khodyrev, E.I.Sirotinin, Yu.N.Zhukova (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR).
Phys. Lett. A (Netherlands), vol.97A, no.7, p.283-5 (12 Sept. 1983).
In the measurement of energy loss Q within the collision parameter interval 0.02 Å $\lesssim b \lesssim$ 0.4 Å a plateau of the curve of $Q(b)$ at $b \lesssim 0.1$ Å has been revealed which may be associated with the polarization of the electronic shell of a gold atom. (8 refs.)

117976 New experimental investigations of the density effect on inner-shell excitation and energy loss. J.F.Bak, F.E.Meyer, J.B.B.Petersen, E.Uggerhoj, K.Ostergaard (Inst. of Phys., Univ. of Aarhus, Aarhus, Denmark), S.P.Moller, A.H.Sorensen.
Phys. Rev. Lett. (USA), vol.51, no.13, p.1163-6 (26 Sept. 1983).
The large spread in γ values ($1\text{-}10^5$) for gigaelectronvolt secondary beams has been used in a novel technique to measure the relativistic effects on inner-shell excitation in Cu and Al and energy loss in Si and Ge. In *K*-shell excitation, a pronounced influence of density effect is found for the first time, in apparent contradiction to earlier measurements, where the lack of density effects has been a great mystery. These problems are explained as target-thickness effects in connection with transition radiation. (18 refs.)

117977 Evidence of dynamical effect on molecular autoionization from He^+ impact on He. N.Tokoro, S.Takenouchi, N.Oda (Res. Lab. for Nuclear Reactors, Tokyo Inst. of Technol., Tokyo, Japan).
Phys. Rev. Lett. (USA), vol.51, no.14, p.1255-8 (3 Oct. 1983).
Measurements have been done for ejected-electron spectra from 5-27-keV He^+ impact on He. A bandlike structure is observed in the higher-energy part of the spectra and theoretically reproduced as a result of molecular autoionization of ${He_2}^+$. The value of autoionization width Γ_A is closely proportional to the energy of the incident He^+ ion. This result leads to the conclusion that the dominant process for the observed molecular autoionization is due to the dynamical couplings. (17 refs.)

117978 Equilibrium charge-state distributions of 35-146 MeV Cu ions behind carbon foils. K.Shima, T.Ishihara, T.Miyoshi, T.Mikumo (Tandem Accelerator Center, Univ. of Tsukuba, Ibaraki, Japan).
Phys. Rev. A (USA), vol.28, no.4, p.2162-8 (Oct. 1983).
Equilibrium charge-state distributions of Cu ions behind carbon foils have been measured in the energy region 35-146 MeV. The equilibration is obtained with about 30- and 50-μg/cm^2-thick carbon at energies of 65 and 120 MeV, respectively. Almost-constant values of distribution widths have been observed in the 35-47-MeV and 96-146-MeV energy regions. The former corresponds to the Cu ions whose outermost electrons are mainly distributed in the *M* shell, while the latter in the *L* shell. The asymmetry of the charge distribution has been observed in the boundary charge state between the Cu *L* and *M* shells. Such an asymmetric distribution function has been well approximated with the connection of two Gaussian distributions with an equal centroid but with different standard deviations. (32 refs.)

117979 Relative excitation functions for terms in C II, C III, and C IV populated in the beam-foil interaction. Y.Baudinet-Robinet, P.D.Dumont (Inst. de Phys. Nucleaire, Univ. de Liege, Liege, Belgium).
Phys. Rev. A (USA), vol.28, no.4, p.2169-72 (Oct. 1983).
Relative populations of terms in C II, C III, and C IV, excited after the passage of C^+ ions through a carbon foil, have been measured as a function of the projectile energy ($0.3 < E < 2.3$ MeV). These excitation functions are shown to depend on the energy of the term and, in C II, a dependence on the core configuration of the term is observed at low projectile energies ($E < 0.6$ MeV). The excitation functions are also compared to the charge-state-fraction curves as a function of the ion energy and this comparison generally allows an unambiguous identification of the charge of the ion emitting an unclassified transition in C II, C III, and C IV. (26 refs.)

117980 Analysis of proton-He resonances in very-low-energy collisions. S.Bosanac, K.Knesaurek (R. Boskovic Inst., Zagreb, Yugoslavia).
Phys. Rev. A (USA), vol.28, no.4, p.2173-80 (Oct. 1983).
Energy dependence of the H^+-He differential cross section is analyzed for a fixed scattering angle. The energy range is between 0.1 and 0.7 eV. Rather complex resonance structure is found in which it is difficult to isolate the contribution of a single resonance. (29 refs.)

117981 Atom-atom momentum-transfer cross section in the presence of resonances. S.Bosanac, K.Knesaurek (R. Boskovic Inst., Zagreb, Yugoslavia).
Phys. Rev. A (USA), vol.28, no.4, p.2190-4 (Oct. 1983).
The atom-atom momentum-transfer cross section is analyzed for low-energy collisions in which resonances may be present. It is shown that their contribution to this cross section can be substantial, and this is confirmed in the calculation on H^+-He system. (35 refs.)

34.70 CHARGE TRANSFER

(see also 82.30 Charge transfer reactions)

117982 Charge transfer between neon ions and metastable helium. R.H.Neynaber, S.Y.Tang (Inst. for Pure & Appl. Phys. Sci., Univ. of California, San Diego, La Jolla, CA, USA).
Chem. Phys. Lett. (Netherlands), vol.100, no.4, p.316-19 (16 Sept. 1983).
Merging beams are used to measure cross sections for charge transfer in the NE^+-He($2^3S, 2^1S$) system at relative energies from 0.01 to 1000 eV. The results are in reasonable agreement with calculations obtained from a modified Demkov approach. (15 refs.)

117983 Electron transfer in proteins. S.Larsson (Dept. of Phys. Chem., Univ. of Lund, Lund, Sweden).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.9, p.1375-88 (Sept. 1983).
Thermal electron transfer in protein structures is discussed on the basis of a model first proposed by R.A. Marcus. The electronic matrix element H_{12} is obtained in a many-electron theory for a number of typical structures of interest in proteins. Repetitive structures often permit resonance transfer over long distances provided the absolute value of the coupling matrix element between neighbouring atomic orbitals is larger than a critical value. The crucial energy separation Δ is obtained as a product of the transfer 'pathway' multiplied by coupling matrix elements at the gaps. It is shown that empty gaps are responsible for non-adiabatic behaviour and that saturated as well as aromatic parts of the protein permit electron transfer over larger distances than so far recognized. The Salemme model of the cytochrome c-cytochrome b_5 interaction may permit electron transfer if the 8.4 Å gap between the haem edges is filled by matter, for instance one of the propionate groups at the haem edge. Finally, the cytochrome c-cytochrome c peroxidase model of Poulos and Kraut is discussed and some alternative pathways suggested. (30 refs.)

117984 Exact second Born calculations for electron capture for systems with various projectile and target charges. J.H.McGuire, J.Eichler (Fachbereich Phys., Hahn-Meitner Inst., Berlin, Germany), P.R.Simony.
Phys. Rev. A (USA), vol.28, no.4, p.2104-12 (Oct. 1983).
Results of exact numerical calculations of differential and total 1*s*-1*s* electron-capture cross sections evaluated in the second Born approximation are presented for targets and projectiles of various charges Z_T and Z_P at velocities between 10 and 200 MeV/amu. For symmetric systems with $Z_P = Z_T = Z$ the Thomas peak in the differential cross section, characteristic of a free-wave second Born-approximation process, appears at velocities above $Z^2 \times$(5 MeV/amu), where Z is the nuclear charge of the target (or projectile). The shape of this Thomas peak contains information about real and virtual intermediate states of the system. For total cross sections at velocities below $Z^2 \times$(2 MeV) the second Born-approximation cross section is larger than the first Born-approximation cross section indicating a breakdown of the second Born approximation using the free-wave Green's function. Results using the peaking approximation of Drisko converge to the authors' exact second Born-approximation results only at velocities well above $Z^2 \times$(10 MeV/amu). For systems asymmetric in Z_P and Z_T no exact scaling is found, although the systematics are qualitatively similar to the symmetric case using $Z = {}^1/_2(Z_P + Z_T)$. For p+Ne at 100 MeV, the exact Born-approximation results lie somewhat above exact impulse-approximation calculations. It is found that the peaking approximation of Briggs and Simony converges to exact second Born-approximation results as the asymmetry of the projectile and target charges increases. At very high velocities the peaking approximation of Drisko also converges slowly to the exact second Born-approximation result. (28 refs.)

117985 Line emission from charge transfer with atomic hydrogen at thermal energies. G.A.Shields (Dept. of Astron., Univ. of Texas, Austin, TX, USA), A.Dalgarno, A.Sternberg.
Phys. Rev. A (USA), vol.28, no.4, p.2137-40 (Oct. 1983).
A list is assembled of the emission lines produced by the charge transfer of doubly and trebly charged ions of carbon, nitrogen, oxygen, and neon in collision at low energies with atomic hydrogen. Rate coefficients of 2.0×10^{-9}

$cm^3\ s^{-1}$ for the process $O^{3+}+H \rightarrow O^{2+}(2p3p,{}^1P)+H^+$ and of $2.1 \times 10^{-9}\ cm^3\ s^{-1}$ for the process $O^{3+}+H \rightarrow O^{2+}(2p3p,{}^3D_1)$ at 1 eV are obtained by comparing observations of planetary nebulae with detailed models. (45 refs.)

117986 Near resonance charge transfer from a laser excited donor state. V.S.Kushawaha (Dept. of Phys., Univ. of Missouri, St. Louis, MO, USA).
Z. Phys. A (Germany), vol.313, no.3, p.155-60 (1983).
A laser induced charge transfer from Na($3p$) to hydrogen-ions at different kinetic energies has been studied. An enhancement factor of about 90% in the production rate of Lyman-α radiation has been demonstrated to occur only with H^+ and Na($3p$) atoms reaction; no enhancement was observed with either H_2^+ or H_3^+ ions. Absolute cross-section for the production of Lyman-α radiation during the collision of H^+, H_2^+ and H_3^+ ions and Na($3p$) and Na($3s$) atoms have been measured in the energy range 1-600 eV. The charge exchange reactions involving hydrogen-ions and Na($3p$) atoms created by two different methods have also been compared. (29 refs.)

34.80 ELECTRON SCATTERING

34.80B Elastic scattering of electrons by atoms and molecules

117987 Method of continued fractions with application to atomic physics. J.Horacek (Faculty of Math. & Phys., Charles Univ., Prague, Czechoslovakia), T.Sasakawa.
Phys. Rev. A (USA), vol.28, no.4, p.2151-6 (Oct. 1983).
A new iterative method for solving scattering integral equations for local as well as nonlocal potentials is proposed. The scattering matrix is expressed in the form of a continued fraction. This method converges extremely fast for compact potentials with arbitrary strength. A high precision of the result is expected with a relatively small amount of numerical work. Starting from the second iteration, all functions which are to be computed in the course of iterations are regular at the origin and are of finite range in configuration space. The method is applied to the elastic scattering of electrons from hydrogen atoms in the static, exchange approximation. Its efficiency is compared with some recently proposed methods. (12 refs.)

34.80D Atomic excitation and ionization by electron impact

117988 Threshold law for double ionization by positrons. P.Grujic (Inst. of Phys., Belgrade, Yugoslavia).
Fizika (Yugoslavia), vol.15, no.3, p.213-24 (July-Sept. 1983).
Threshold behaviour of the one-positron triple escape function has been studied within the classical theory. The ionization function energy dependence exponents χ are derived for a number of charges Z of residual ions: 2.966 ($Z=1$), 3.604 ($Z=2$), 4.011 ($Z=3$), etc. Also, the possibility for an experimental verification of the results obtained analytically is discussed. (13 refs.)

117989 Reaction (e^+,e^+e^-) as a development of the (e,2e) method. Yu.V.Popov, V.F.Erokhin (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR).
Phys. Lett. A (Netherlands), vol.97A, no.7, p.280-2 (12 Sept. 1983).
The semiclassical method for the treatment of the post-interaction of outgoing electrons in (e,2e) symmetric processes suggested earlier for an explanation of the correct position of the maximum in angular correlation is generalized to an arbitrary case. At the same time the position of the peak of the triple differential cross section of (e^+,e^+e^-) reactions is predicted. This reaction can be a test to distinguish some models of (e,2e) reactions. (3 refs.)

117990 Cross sections for electron ionization of triply charged noble gases in the plane-wave Born approximation. E.J.McGuire (Sandia Nat. Labs., Albuquerque, NM, USA).
Phys. Rev. A (USA), vol.28, no.4, p.2091-5 (Oct. 1983).
Plane-wave Born-approximation calculations are presented for electron ionization of triply ionized noble-gas ions, and compared with recent experiment. Excellent agreement with experiment is found for Ne^{3+}, Ar^{3+}, and Kr^{3+}. The calculated cross section for ionization of Xe^{3+} is larger than the measurement by almost a factor of 2. The discrepancy is entirely due to the large cross section for excitation of the $(4d)^{10} \rightarrow (4d)^9(4f)$ transition followed by autoionization. It is suggested that configuration interaction will redistribute this transition with some strength transferred to exciting bound levels. (20 refs.)

117991 Resonance and intermediate-coupling effects in electron scattering with highly charged ions. I. Collision strength for Fe^{24+}, Se^{32+}, and Mo^{40+}. A.K.Pradhan (Dept. of Phys., Univ. of Windsor, Windsor, Ontario, Canada).
Phys. Rev. A (USA), vol.28, no.4, p.2113-27 (Oct. 1983).
A study of electron-impact excitation of highly charge ions in the helium isoelectronic sequence is reported. Nonresonant, intermediate-coupling collision strengths are computed for transitions up to and including the $n=3$ states. With the 13 fine-structure levels, i.e. $1s^2({}^1S_0)$, $1s2s({}^3S_1;\ {}^1S_0)$, $1s2p({}^3P_{0,1,2};\ {}^1P_1)$, $1s3s({}^3S_1;\ {}^1S_0)$, and $1s3p({}^3P_{0,1,2};\ {}^1P_1)$, there are 78 different inelastic transitions. Main calculations are carried out in the nine-state distorted-wave approximation including partial waves $l \leq 15$. Relativistic effects are taken into account in the Breit-Pauli approximation. Nine-state close-coupling calculations are also carried out for Fe^{24+} with $l \leq 4$ at a few energies for comparison (and for later work in paper II). Higher partial waves ($l > 15$) are treated by the Coulomb-Bethe method using accurate relativistic eigenenergies and oscillator strengths for the target ions. The Z dependence of the departure from LS coupling is investigated. Present results are in good general agreement with previous calculations where available, but some discrepancies are noted or clarified. Collision strengths are tabulated at energies from near the excitation energy of the $n=3$ complex to sufficiently high energies to enable rate coefficients to be computed. For transitions to the $n=3$ levels and for transitions where resonances are not important, the present values should yield reasonably accurate excitation rates (resonances are considered in paper II). The present data are required particularly for the analysis of observed spectra from high-temperature, high-density plasmas where the line intensities may depend on collisional redistribution among a number of excited $n=2$ and $n=3$ states. (22 refs.)

117992 Positronium formation in positron-helium scattering. P.Khan (Muralidhar Girls' School, Calcutta, India), A.S.Ghosh.
Phys. Rev. A (USA), vol.28, no.4, p.2181-9 (Oct. 1983).
The positronium-formation cross sections in positron-helium scattering have been calculated with the use of a distorted-wave polarized-orbital method from the threshold to 100 eV. The results with and without the matrix elements involving the distorted target wave functions are found to differ appreciably. The results of the first Born approximation are not expected to be correct even at the incident-positron energy 100 eV. The measured values at 20 eV are found to be less than $^1/_2$ of the present predicted values. The sharp rise of the formation cross section within the ore-gap region as observed by Charlton et al. (1980) has also been noticed by the authors. The minimum in the differential cross section has been found at all energies as in the case of hydrogen atom. (10 refs.)

34.80G Molecular excitation, ionization, and dissociation by electron impact

117993 Electron impact dissociation of simple molecules. Y.Hatano (Dept. of Chem., Tokyo Inst. of Technol., Tokyo, Japan).
Comments At. & Mol. Phys. (GB), vol.13, no.6, p.259-73 (1983).
A survey is given of recent experimental studies of the electron impact dissociation of simple molecules with emphasis on translational spectroscopy of dissociation fragment atoms by Doppler profile measurements of Balmer emission. The principle of experimental technique, the results and the discussion are summarized for H_2, D_2 and the molecules H_2O, HF, CH_4 and NH_3 in an isoelectronic sequence. Evidence has been given for the electronic structure of superexcited states and their dissociation processes. (46 refs.)

117994 Dissociative excitation of SiH_4, SiD_4 Si_2H_6 and GeH_4 by 0-100 eV electron impact. J.Perrin (Ecole Polytech., Palaiseau, France), J.F.M.Aarts.
Chem. Phys. (Netherlands), vol.80, no.3, p.351-65 (15 Oct. 1983).
The authors have measured emission cross sections of various electronically excited fragments produced by electron-impact dissociation of SiH_4, SiD_4, Si_2H_6 and GeH_4. At low impact energy (10-20 eV), the measured appearance potentials are correlated to specific dissociation processes. Below 22 eV superexcited states of SiH_4 play a dominant role in the formation of neutral excited fragments. In agreement with the results obtained on alkanes, the cross sections for fragment emission from Si_2H_6 are lower than those of SiH_4. On the other hand, the comparison of cross sections at 100 eV for fragment emission, dissociation and ionization on going from CH_4 to SiH_4 and GeH_4 shows an increase of the probability for production of neutral ground-state fragments at the cost of excited or ionic fragments. Both effects can be explained by a growing probability for internal conversion among the decay channels of superexcited states with increasing number of atoms or electrons in the parent molecule. For each molecule, the H Balmer-emission cross sections at 100 eV are proportional to n^{-b}, where $n \geq 3$ is the principal quantum number of the upper state of H and $3<b<5$ is a parameter characteristic of the parent molecule. Finally, a detailed analysis of the isotope effect between SiH_4 and SiD_4 on both fragment emission and ionization cross sections from 0 to 100 eV gives strong evidence of the competition between dissociation and autionisation in the decay of superexcited states. (41 refs.)

117995 Core level excitation of simple gases. A.Zhang, J.F.Morar, R.L.Park (Dept. of Phys. & Astron., Univ. of Maryland, College Park, MD, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1461-4 (1983).
The ionization of simple gases by electron bombardment exhibits distinct resonances at electron energies slightly below the core level binding energies of the atomic constituents of the gas. A vacancy in an inner shell of the atom may recombine by a radiationless Auger process, thus leaving the molecule in a singly or higher ionized state. These ions are easily collected and the threshold resonances for excitation are evident in the second derivative of the ion yield plotted as a function of the energy of the electron beam. By using a mixture of gases, such as CO and CO_2, it is possible to measure relative chemical shifts of the C and O $1s$ thresholds. In this case the C $1s$ threshold is 3.9 eV lower in CO than in Co_2, and the O 1s threshold is 2.7 eV lower in CO than in CO_2. The authors discuss the feasibility of constructing a simple analyzer based on this technique to supplement conventional mass spectrometer analysis of gas composition. (11 refs.)

117996 Electron impact excitation of λ7990-Å multiplet. P.W.Erdman, E.C.Zipf (Dept. of Phys. & Astron., Univ. of Pittsburgh, Pittsburgh, PA, USA).
J. Geophys. Res. (USA), vol.88, no.A9, p.7245-9 (1 Sept. 1983).
The dissociative excitation of the atomic oxygen multiplet O I($3s'^3D^0 \rightarrow 3p^3P$; λ7990 Å) due to electron impact on O_2 and NO has been investigated. With O_2 as a target, no lines of this multiplet could be identified with a cross section greater than $2.4 \times 10^{-23}\ cm^2$ at 100 eV. Similar results were obtained for the excitation of NO, yielding an upper limit cross section of $1.1 \times 10^{-23}\ cm^2$. These results are consistent with a λ7990/λ989 branching ratio of $\sim 2.5 \times 10^{-5}$ that is at least an order of magnitude smaller than either the previous experimental upper limits or a recent theoretical calculation. This finding complicates the study of ($3s'^3D^0 \rightarrow 2p^4$ 3P; λ989 Å) radiation entrapment in the thermosphere and increases the potential importance of selective absorption of the λ989-Å multiplet by N_2. Although the latter process may help to explain some aspects of the behavior of λ7990-Å emission in aurorae, it is nonetheless difficult, in the light of the present results, to account for the observed absolute intensity of this infrared cascade transition using current entrapment models. (16 refs.)

117997 Energetics of the ionization and fragmentation of phosphorus oxyfluoride studied by electron-impact spectroscopy. O.Neskovic, M.Miletic, M.Veljkovic, D.Golobocanin, K.F.Zmbov (Boris Kidric Inst. of Nuclear Sci., Belgrade, Yugoslavia).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.9, p.1341-6 (Sept. 1983).
The relative intensities and appearance energies of several positive ions in the mass spectrum of POF_3 are reported together with an ionization-efficiency curve for F^-, the only negative ion of significant intensity. Probable ion-fragmentation pathways are proposed together with the heats of formation of some positive ions and ionization energies for POF_2 and POF. The appearance energies of various electronic states of the observed ions have been

determined by deconvolution of the experimental ionization efficiency curves by the energy-distribution difference method. (19 refs.)

117998 **Electron-beam-induced emission of $KrXe^+$.** A.Luches, A.Perrone, A.Zecca (Dipartimento di Fisica, Univ. di Lecce, Lecce, Italy).
Opt. Commun. (Netherlands), vol.47, no.3, p.199-201 (1 Sept. 1983).
The emission of $KrXe^+$ was studied in Kr-Xe mixtures excited by an intense beam of fast electrons using time-resolved spectroscopy techniques. Previous work is discussed and the discrepancies are explained by noting that the emission band around 490 nm is affected by atomic transitions. Time constants and rate constants for the formation of the molecular ion are given. (12 refs.)

117999 **Density and temperature dependence of electron attachment to O_2 molecules in helium gas.** L.Bruschi, M.Santini, G.Torzo (Dipartimento di Fisica, Univ. di Padova, Padua, Italy).
Phys. Lett. A (Netherlands), vol.97A, no.7, p.286-8 (12 Sept. 1983).
The electron attachment frequency to O_2 molecules in dense helium gas shows a sharp peak at a temperature-dependent density N_p. The shape of the peak is simply related to the energy distribution function, and gives information on the tail states. (6 refs.)

34.90 OTHER TOPICS IN ATOMIC AND MOLECULAR COLLISION PROCESSES AND INTERACTIONS

118000 **Neutron scattering model for benzene.** F.Sefidvash (Nuclear Engng. Dept., Federal Univ. of Rio Grande do Sul, Porto Alegre, Brazil).
Atomkernenerg. Kerntech. (Germany), vol.42, no.3, p.191-2 (1983).
A theoretical model analogous to the Nelkin model for water for neutron scattering by protons bound in benzene is proposed. The physical model comprises a free translation of mass 78, a hindered rotational oscillator of effective mass 21.3 at an energy of 0.02 eV and two vibrational oscillators at energies 0.146 and 0.38 eV with masses of 1.62 and 3.09 respectively. The diffusion constant of 51000 cm^2/sec calculated by the model agrees well with the experimental value of (50360 ± 200) cm^2/sec. (9 refs.)

J. Radioanal. Chem. (Switzerland), vol.79, no.1, p.5-13 (1983).
Radium-228 was separated from aged thorium nitrate by liquid-liquid, two-phase, extraction and extensively purified, principally by ion-exchange chromatography. The radioactivity concentration of the purified radium-228 was measured by means of liquid-scintillation β-particle measurements of the ^{228}Ac daughter (corrected for progeny ingrowth). The results were confirmed by Ge(Li) well-detector intercomparison with radium-228 in equilibrium with its thorium-232 precursor which had been measured gravimetrically. Three hundred ampoules were provided to the US Environmental Protection Agency, Las Vegas, for distribution. (11 refs.)

118002 **PARST: a system of FORTRAN routines for calculating molecular structure parameters from results of crystal structure analyses.** M.Nardelli (Istituto di Chimica Generale e Inorganica, Univ. di Parma, Parma, Italy).
Comput. & Chem. (GB), vol.7, no.3, p.95-8 (1983).
Given a set of atomic positional and thermal parameters in a crystal defined by the unit cell constants and the space group symmetry operations, the title program calculates: (1) the Niggli reduced cell, (2) V, M, D_c, $F(000)$ and μ, (3) the orthogonal coordinates in Å, (4) the principal axes of the thermal ellipsoids together with U_{eq} and B_{eq}, (5) all bond distances, (6) all bond angles, (7) all torsion angles, (8) coordinates of hydrogen atoms in typical groups, (9) weighted least-squares planes or straight lines through given subsets of atoms and the angles they form, (10) ring puckering coordinates and displacement asymmetry parameters, (11) spherical polar coordinates for stereographic projections of atomic environments, (12) interatomic contacts between atoms of the given set and between these and symmetry related atoms, (13) geometrical parameters of possible hydrogen bonds, (14) transformed coordinates of pairs of atomic subsets to check the possible presence of pseudo-symmetries or to find the atoms responsible for the departure from symmetry, etc. (20 refs.)

118003 **Calculation of bond angles, lengths, and dihedral on a pocket calculator.** G.Herbert Caines, M.D.Johnston,Jr. (Dept. of Chem., Univ. of South Florida, Tampa, FL, USA).
Comput. & Chem. (GB), vol.7, no.3, p.99-102 (1983).
The method and software for calculating bond angles, bond lengths, and dihedral angles with an indication of (+) or (−) rotation is presented for the HP-67 calculator. Input coordinates are retained thereby eliminating duplicate re-input for similar calculations. (2 refs.)

118004 **Modifications to program SPACEFIL to produce shaded space-filling molecular models with perspective.** D.R.Henry (Dept. of Chem., Pennsylvania State Univ., University Park, PA, USA).
Comput. & Chem. (GB), vol.7, no.3, p.119-35 (1983).
Modifications to the program SPACEFIL are described, which allow the application of perspective transformations and atom shading to the space filling plots produced by the program. Other changes are described which allow the plotting of ORTEP-like ball and stick figures. (no refs.)

118005 **Conformation of N-substituted heterocycles with an endocyclic amide group. The effect of allylic strain.** B.Kurtev, M.Lyapova, S.Mishev, O.Nakova, A.Orahovats, I.Pojarlieff (Inst. of Organic Chem., Bulgarian Acad. of Sci., Sofia, Bulgaria).
Izv. Khim. Bulg. Akad. Nauk. (Bulgaria), vol.15, no.4, p.375-86 (1982). [received: Sept. 1983]
The conformation of the cis- and trans-isomers of 4,5-diphenyl-, and 5,6-diphenyl-tetrahydro-1,3-oxazine-2-one and 4,5-diphenyl-hexahydropyrimidine-2-one and of some of their N-substituted derivatives as well as the 1-methyl derivatives of 6-phenyl and trans-5,6-diphenyl-dihydrouracyl, have been studied by means of ^1H-NMR spectroscopy. Conformers with 4a, 6e, 4a, 5e and 5a, 6e phenyl group are preferred in the respective isomers of the N-H oxazionones confirming a half-chair conformation of the ring. Allylic strain caused by N-substituents shifts strongly the a, e⇄e, a equilibria in trans-4,6-diphenyl and cis-4,5-diphenyl-oxazinones and only moderately the e, e⇄a, a equilibria in the compounds with trans-vicinal phenyl groups. In the latter the diaxial conformation is preferred only in the case of bulky N-substituents. The diaxial conformation of trans-vicinal phenyl groups is most readily attained in the dihydrouracyl, less readily in the pyrimidone and least in the oxazinone system. (20 refs.)

118006 **Role of cations in the conformation of iota and kappa carrageenan.** I.T.Norton, D.M.Goodall (Dept. of Chem., Univ. of York, York, England), E.R.Morris, D.A.Rees.
J. Chem. Soc. Faraday Trans. I (GB), vol.79, pt.10, p.2475-88 (Oct. 1983).
Cation binding to iota and kappa carrageenan has been investigated by IR spectroscopy, differential scanning calorimetry, optical rotation, intrinsic viscosity and light scattering. From measurements of the salt dependence of the midpoint of the thermally induced order-disorder transition the increase in the number of cations associated with each disaccharide unit was estimated. IR studies of sulphate stretching frequencies for the ordered conformation indicate that association of tetramethylammonium ions to carrageenan is by simple atmospheric binding. With K^+, by contrast, there is evidence of ion-pair formation, with stronger binding to kappa carrageenan than to iota. Enthalpy changes for the order-disorder transition support these conclusions. Comparison of intrinsic viscosity at high temperature in sodium or potassium chloride solution with values obtained in tetramethylammonium chloride solution indicate a less expanded conformation, consistent with a reduction in charge density by site binding of Na^+ and K^+, but not Me_4N^+. Binding constants were estimated from the variation in optical rotation of the disordered form with $[Na^+]$ and $[K^+]$. Light-scattering studies for segmented iota carrageenan in the high-temperature (disordered) conformation give radii of gyration for the Na^+ and K^+ salt forms which are close to the value calculated for an unperturbed random coil, while in tetramethylammonium chloride the radius of gyration is appreciably higher. (35 refs.)

118007 **Equilibrium and dynamic studies of the disorder-order transition of kappa carrageenan.** I.T.Norton, D.M.Goodall (Dept. of Chem., Univ. of York, York, England), E.R.Morris, D.A.Rees.
J. Chem. Soc. Faraday Trans. I (GB), vol.79, pt.10, p.2489-500 (Oct. 1983).
The equilibria and dynamics of the transition from disorder to order in the polysaccharide kappa carrageenan have been investigated over a range of KCl

concentrations and temperatures. Kinetic observations can be explained by the following sequential mechanism for ordering of disaccharide residues following a salt-concentration jump: conformational change in disordered form $C^\circ \rightarrow C$, (II), dimerisation, $2C \rightleftharpoons H_2$, (III), aggregate formation $xC + yH_2 \rightleftharpoons (H_2)_{(1/2x+y)}$, (IV), where C indicates a random coil and H a helix residue. Reaction (III) was investigated quantitatively using a stopped-flow polarimeter, and the rate equation shown to be that of a second-order forward, first-order reverse equilibration, consistent with double-helix formation. Forward rate constants extrapolate to zero at the transition midpoint, as expected for a cooperative transition. Rate and activation parameters for helix nucleation in 0.50 mol. dm^{-3} KCl are $k_2(298K) = (9 \pm 1) \times 10^3$ dm^3 $mol.^{-1}$ s^{-1}, $\Delta H^* = 5 \pm 3$ kJ $mol.^{-1}$ and $\Delta S^* = -150 \pm 10$ J $mol.^{-1}$ K^{-1}. Parallels are drawn with polynucleotide double-helix formation, and in particular the low value of ΔH^* is consistent with a nucleation length of 1 or 2 disaccharides. A lower bound of 36 ± 3 disaccharides is estimated for the cooperative length from equilibrium and DSC data for the transition. (26 refs.)

118008 Dynamics of cation-induced conformational ordering in solutions of segmented iota carrageenan. I.T.Norton, D.M.Goodall (Dept. of Chem., Univ. of York, York, England), E.R.Morris, D.A.Rees.
J. Chem. Soc. Faraday Trans. I (GB), vol.79, pt.10, p.2501-15 (Oct. 1983).
Optical-rotation and stopped-flow polarimetric studies of the salt-induced ordering of iota carrageenan segments have been carried out in tetramethylammonium, sodium and potassium chloride solutions over a range of temperatures and salt concentrations. Equilibrium and kinetic data accord with a cooperative dimerisation process, consistent with double-helix formation. The transition mechanism was further characterised by comparing the kinetics of reaction of fully disordered and partially ordered samples. The activation parameters for helix nucleation show that variations in ΔG^*_{298} are small, but changes in ΔH^* and ΔS^* with salt form and concentration (c) are substantial. Changes in the activation parameters at high $[Na^+]$ and $[K^+]$ correlate with increased flexibility of the disordered form due to a reduction in interchain electrostatic repulsion on ion-pair formation. 118009 Dissociation energy of Li_2 molecule. R.R.Reddy (Dept. of Phys., KSRM, Coll. of Engng., Cuddapah, India), T.V.R.Rao.
Acta Phys. Pol. A (Poland), vol.A64, no.3, p.309-13 (Sept. 1983).
Experimental potential energy curve for the $X^1\Sigma_g^+$ state of Li_2 has been calculated using the method of Lakshman and Rao (1971). The dissociation energy of the ground state of Li_2 has been estimated to be 1.11 eV by the method of curve fitting using modified H-H function with the Lakshman and Rao's curve. The ionization potential of Li_2 molecule has been estimated to be 5.06 eV which is in good agreement with the value given by Huber and Herzberg (1979). (19 refs.)

118010 Bond strengths of organothorium and organouranium compounds. J.W.Bruno, T.J.Marks (Dept. of Chem., Northwestern Univ., Evanston, IL, USA), L.R.Morss.
J. Less-Common Met. (Switzerland), vol.93, no.2, p.357 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
Summary form only given, as follows. The dissociation energies of Th-C, Th-H and U-C bonds were determined in a series of compounds of the general formula $[\eta^5\text{-}C_5(CH_3)_5]_2MR_2$ where M is thorium or uranium and R represents hydrocarbyl, amide or hydride. Enthalpy data were obtained from heats of solution in toluene followed by heats of alcoholysis with tert-butanol in an inert gas batch titration reaction calorimeter. Calculated Th-R bond dissociation enthalpies range from 56 to 98 kcal mol^{-1}, decreasing in the order hydride $\gtrsim$amides$>$alkyls; corresponding U-R bonds are approximately 8 kcal mol^{-1} weaker. These results can be interpreted in terms of ligand geometry and the properties of the actinide ions. The data elucidate organoactinide reaction patterns involving C-H activation, cyclometallation, β hydride elimination and CO insertion.

118011 Proton affinities of GeH_4 and SiH_4. III. Calculations of proton affinity of GeH_4 in terms of a large basis set including polarization functions. S.Sudo, O.Nomura, S.Ikuta, S.Katagiri.
Rep. Inst. Phys. & Chem. Res. (Japan), vol.59, no.4, p.127-33 (1983). In Japanese.
Proton affinity of GeH_4 was calculated by using a large basis set which includes polarization functions, (i.e. f and p orbitals were used for Ge and H respectively). One hundred and thirty primitive GTOs in all were contracted to 90 CGTOs for GeH_5^+. For the species $GeH_5^+(Cs)$, $GeH_4(Td)$ and $GeH_3^+(D_{3h})$ all structural parameters were optimized by the three-point interpolation. The resulting proton affinity of GeH_4 was 7.12 eV, which is in good agreement with the observed value of 7.03 eV. By Mulliken population analysis of GeH_5^+, the authors obtained the AO population of f and p orbitals as follows: $N\{Ge(f)\} = 0.019$, $N\{H_{1,2,3}(p)\} = 0.008$, $N\{H_{4,5}(p)\} = 0.012$. 118013 Semi-empirical diamagnetic susceptibilities of cyclic β-ketoacetals. R.R.Gupta, M.Kumar (Dept. of Chem., Univ. of Rajasthan, Jaipur, India).
Chem. Phys. Lett. (Netherlands), vol.100, no.3, p.297-9 (9 Sept. 1983).
Diamagnetic susceptibilities of cyclic β-ketoacetals have been calculated theoretically by wave-mechanical and semi-empirical approach. The wave-mechanical approach, however, gives due considerations to the contributions of all types of electrons but still, the agreement between experimental and theoretical values is not satisfactory. Semi-empirical approach in which diamagnetic susceptibility is considered to be contributed by atoms, bonds, and bond-bond interactions provided excellent results of diamagnetic susceptibilities irrespective of different structural environments present in these molecules and contributing considerably to the molecular diamagnetism. 118014 Rigid-body motion of the $S_2O_3^{2-}$ group in thiosulphates. N.Armagan (Ankara Univ. Fen Fakultesi Fizik Bolumu, Ankara, Turkey).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.647-50 (1 Sept. 1983).
The recently published thermal parameters of Ba, Na, Mg, Ni, and NH_4 thiosulphates have been analysed for the rigid-body motion of the $S_2O_3^{2-}$ group using the **TL** and **TLS** treatments. In the cases of Ba, Na and NH_4 the rigidity of the group has been established and justified by employing various rigidity tests. Librational corrections to bond lengths have been found to be appreciable. For the cases of Mg and Ni the rigidity has been observed, but due to high ESDs detailed analysis has not been made. Hamilton's test has shown that the **TLS** treatment is preferable to the **TL** in all cases. (15 refs.)

118015 A method for predicting the anharmonicity constants $\omega_e\chi_e$ of halides of sodium. N.S.Murthy, N.S.Bapat, T.Manisekaran (Dept. of Phys., Univ. of Mysore, Mysore, India).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.30, no.4, p.381-3 (Oct. 1983).
A method is proposed for estimation of the vibrational anharmonicity constants $\omega_e\chi_e$ of diatomic molecules. The procedure involves fitting of the potential energy curve obtained by the RKRV method with that obtained by using the 5-parameter Hulburt-Hirschfelder potential function. The authors predicted values of $\omega_e\chi_e$ for alkali halides for which accurate data are not available. (10 refs.)

36.20 MACROMOLECULES AND POLYMER MOLECULES

(for biological macromolecules, see also 87.15; for polymer reactions and polymerization, see 82.35)

118016 Low-angle laser light scattering for determination of molecular weights—an inter-laboratory comparison. T.Dumelow, S.R.Holding, L.J.Maisey (Rubber & Plastics Res. Assoc., Shrewsbury, England).
Polym. Commun. (GB), vol.24, no.10, p.307-9 (Oct. 1983).
A round robin experiment was carried out to compare weight average molecular weight values for polymers obtained by several laboratories using low-angle laser light scattering. A low variation in results was found; also the study identified faults in some of the instruments used. (1 ref.)

118017 Hydrogen bond length and ^{1}H NMR chemical shifts in proteins. G.Wagner, A.Pardi, K.Wuthrich (Inst. fur Molekularbiologie und Biophys., Eidgenossiche Tech. Hochschule, Zurich-Honggerberg, Switzerland).
J. Am. Chem. Soc. (USA), vol.105, no.18, p.5948-9 (7 Sept. 1983).
The authors proposed novel NMR procedures for studies of the spatial structure of noncrystalline proteins (1982). In this scheme the initial structure determination relies primarily on measurements of intramolecular nuclear Overhauser effects between individually assigned hydrogen atoms. Subsequent refinements of the structure, however, depend further on correlations between additional NMR parameters and polypeptide conformation. The present communication reports on correlations observed between proton NMR chemical shifts and the length of intramolecular hydrogen bonds in a globular protein. Besides their potential usefulness for structure refinements these observations are of general interest because of the importance of hydrogen bonds in proteins. (14 refs.)

118018 Excuded volume effects in polymers attached to surfaces: chain conformational renormalization group. K.F.Freed (Dept. of Chem., Univ. of Chicago, Chicago, IL, USA).
J. Chem. Phys. (USA), vol.79, no.6, p.3121-32 (15 Sept. 1983).
The chain conformational space renormalization group method is extended to treat polymers with one or both ends attached to a wall. The theory is illustrated for the case of reflecting boundary conditions at the wall, but the methods for treating general boundary conditions are outlined. The fixed end-vector partition functions are evaluated both in the asymptotic scaling limit and in the cross-over regime where there is an explicit dependence on the strength of the excluded volume interaction. The mean square chain sizes transverse $\langle z^2 \rangle$ and parallel $\langle |\rho|^2 \rangle$ to the surface are evaluated separately to illustrate the use of the theory for the direct computation of these moments (including the prefactors) and the exponents. The calculations in these cases are far simpler than those required to determine the distribution functions. The prefactors display $\langle |\rho|^2 \rangle$ to be more spread out than $\langle z^2 \rangle$ which, in turn, as expected, is more spread out than $\langle \mathbf{R}^2 \rangle$ for a chain in free space. (29 refs.)

118019 Correction-to-scaling exponents and amplitudes for the correlation length of linear polymers in two dimensions. Z.V.Djordjevic, I.Majid, H.E.Stanley, R.J.Dos Santos (Dept. of Phys., Boston Univ., Boston, MA, USA).
J. Phys. A (GB), vol.16, no.14, p.L519-23 (1 Oct. 1983).
The authors consider the scaling behavior of the radius of gyration for a system of dilute linear polymers. They focus on ρ_N, the mean-square end-to-end distance of an N-step self-avoiding walk for which an additional two terms were recently calculated for the close-packed triangular lattice. Combining several extrapolation methods, they find that a consistent description of the scaling behaviour exists if and only if the correction-to-scaling exponent Δ is roughly half as large as commonly believed. They conclude that all data are consistent with the equation $\rho_N = AN^{2\nu}(1+B/N^{\Delta}+C/N)$ where $\nu = {}^3/_4$, $\Delta \simeq {}^2/_3$, $A \simeq 1/\sqrt{2}$, $AB \simeq 0.21$ and $C < 10^{-1}$. (21 refs.)

118020 Transition phenomena in polystyrene near the theta condition. C.Tsitsilianis, E.Pierri, A.Dondos (Dept. of Chem. Engng., Univ. of Patras, Patras, Greece).
J. Polym. Sci. Polym. Lett. Ed. (USA), vol.21, no.9, p.685-91 (Sept. 1983).
In recent years many works have appeared on conformational transitions of synthetic macromolecules. In all these studies the proposed explanation of the transition is a difference in mobility of the side groups of the chain, below and above the transition temperature. More precisely, it is accepted that at temperatures below the transition temperature there are strong interactions between side groups giving rise to a rather rigid and perhaps helicoidal structure. Above the transition temperature, rotations become easier, and the ridigity of parts of the molecules disappears. The authors present some viscosimetric results, obtained with linear and star-shaped polystyrenes, near the theta temperature. In this region, a new transition phenomenon is reported for this polymer (another transition has already been observed at higher temperature). (18 refs.)

118021 Cross-links in polyacetylene. C.T.White (Naval Res. Lab., Washington, DC, USA), P.Brant, M.L.Elert.
J. Phys. Colloq. (France), vol.44, no.C-3, p.443-6 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Suggests that cross-link formation during the cis to trans isomerization of polyacetylene can account for the unpaired electron spins in the trans-film. Results of self-consistent quantum chemical calculations that support and illustrate the basic ideas are reported. (4 refs.)

118022 Potential energy calculations on polyacetylene. E.Cernia, L.D'Ilario, G.Nencini (ASSORENI, Rome, Italy).
J. Phys. Colloq. (France), vol.44, no.C-3, p.447-50 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
The results are presented of the potential energy calculations performed on the isolated chain of polyacetylene, as a function of the number of rotational degrees of freedom allowed to the chain, of the barrier height to the bond rotation, of the cis and trans configuration, of the molecular geometry and of the Van de Waals potential functions sets. The findings support the view of a conformation slightly distorted from planarity for the trans polymer, with possible conformational disorder within the chain, and of a 'dilution effect' of cisoidal units within trans sequences for the trans-cisoidal conformation. For the cis polymer a 'gauche' conformation is found to be likely the most stable one, with alignment of the double bonds belonging to succeeding helical turns whose distance is 3.3Å, giving rise to π-π intramolecular interactions. (14 refs.)

118023 Orientation of molecules of epoxide oligomers in a uniform stationary magnetic field. Yu.P.Rodin, Yu.M.Molchanov (Inst. of Polymer Mech., Acad. of Sci., Riga, Latvian SSR).
Mech. Compos. Mater. (USA), vol.18, no.6, p.715-18 (Nov.-Dec. 1983). Translation of: *Mekh. Kompozitnykh Mater. (USSR)*, vol.18, no.6, p.1056-9 (Nov.-Dec. 1982). [received: Sept. 1983]
The experiment used epoxy resin ED-20, which was poured between two polyfluoroethylene resin films, 5 μm thick, fixed on a nonmagnetic holder. The holder was placed between the electromagnetic sockets of a strong field permeameter. After the magnetic action, whose maximal time was 20 min, the holder with the resin was placed in the measuring channel of a UR-20 infrared spectrometer, where by means of a polarizer, the absorption spectra of a magneto-treated resin were recorded at two positions. The degree of orientation of the molecule was determined from the value of the dichroic ratio. The analysis of the dependences obtained showed that the orientation of the EO molecules induced by a magnetic field was retained for a considerable time after switching off of the field. Thus, the epoxy resin treated in a magnetic field had the unique effect of a structural 'memory', which can be used in the preparation of composite materials from it. (11 refs.)

118024 Topological solitons and modulated structure of bases in DNA double helices: a dynamic plane base-rotator model. S.Takeno (Dept. of Phys., Kyoto Tech. Univ., Kyoto, Japan), S.Homma.
Prog. Theor. Phys. (Japan), vol.70, no.1, p.308-11 (July 1983).
Topological solitons and modulated structures of bases in DNA macromolecules are studied by using a dynamic plane-base rotator model. It is shown that there exist 2π topological solitons in the continuum approximation and metastable structures of bases, such as commensurate, incommensurate and chaotic structures. (7 refs.)

118025 Conformations of polymer chains grafted to unpermeable plane surface. T.M.Birshtein, E.B.Zhulina.
Vysokomol. Soedin. Ser. A (USSR), vol.25, no.9, p.1862-8 (Sept. 1983). In Russian. English translation in: *Polym. Sci. USSR (GB)*
The system of long polymer chains grafted by one end of unpermeable plane surface has been studied by scaling method. The thermodynamic rigidity of grafted chains and quality of the solvent are taken into account. The diagram of the states and equilibrium characteristics of the system in each distinguished region of the diagram are determined. The influence of rigidity of macromolecules on the form of the diagram of the states is discussed. (13 refs.)

36.40 ATOMIC AND MOLECULAR CLUSTERS

118026 Theoretical study on the structure and stability of hydrogen-ion clusters H_n^+ and H_n^- (n=3, 5, 7, 9, 11, 13). K.Hirao (Dept. of Chem., Coll. of General Education, Nagoya Univ., Nagoya, Japan), S.Yamabe.
Chem. Phys. (Netherlands), vol.80, no.3, p.237-43 (15 Oct. 1983).
Ab initio SCF and CI calculations have been carried out for H_n^+ and H_n^- (n=3, 5, 7, 9, 11, 13) clusters with a double-zeta plus polarization basis set. The stabilization energy of negative ion clusters H_n^- is very small (less than 1 kcal) and their existence is critical. The structural difference between positive-and negative-ion clusters are discussed in terms of the bonding ability involved. While H_n^+ is a charge-transfer complex, the stability of H_n^- comes mainly from the ion-induced-dipole attractions. The electron correlation effect on the structure and stability of these ion clusters is also discussed. (15 refs.)

118027 Analogy of the Eshelby principle in the electrodynamics of inhomogeneous conducting media. A.K.Shidlovs'kii, A.F.Kovalevs'kii, V.F.Reztsov.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.9, p.74-7 (1983). In Ukrainian.
An integral energy condition of the Eshelby type is deduced for inhomogeneous conducting media. The results obtained may be used for calculating total energy losses due to electrothermal heating of a two-dimensional medium with localized inclusions. (5 refs.)

118028 Gaussian beams: paraxial theory. G.A.Deschamps (Dept. of Electrical Engng., Univ. of Illinois, Urbana, IL, USA).
Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute, Norwich, England, 23 July-4 Aug. 1979 (Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981), p.745-66
A beam of electromagnetic radiation is a propagating field that remains substantially close to a central line called its axis. The transformation in such beams, either by propagation or reflection and refraction at some surfaces, is analyzed by using the paraxial approximation or replacing the wave equation by a parabolic equation. A central result is that Gaussian beams can be represented by pencils of complex rays and that consequently their transformations through optical systems obey the laws of geometrical optics as they apply to pencils of real rays. 41.10D Electrostatics, magnetostatics

118029 An approach to electrostatic interaction by using the elliptic functions. M.Agop (Inst. for Nuclear Power Reactors, Pitesti, Rumania).
Acta Phys. Pol. A (Poland), vol.A64, no.3, p.251-4 (Sept. 1983).
The influence of the electric quadrupole moment on a test charge is studied by using the elliptic functions in nonrelativistic approximation. (3 refs.)

118030 Variational formulation for the equilibrium condition of a conducting fluid in an electric field. N.Sujatha, P.H.Cutler, E.Kazes, J.P.Rogers (Dept. of Phys., Pennsylvania State Univ., University Park, PA, USA), N.M.Miskovsky.
Appl. Phys. A (Germany), vol.A32, no.2, p.55-61 (Oct. 1983).
The variational formalism is used to derive a set of equations describing the equilibrium configuration of a conducting fluid in an applied electric field. The validity of the variational equations is confirmed by application to the well-defined problem of concentric spherical electrodes. It is further shown that a cone, including the so-called Taylor cone used to model the equilibrium configuration of liquid metal ion sources, is inconsistent with the general equations. An analysis of the Taylor derivation suggests that reasons for the disagreement are the omission of the pressure difference term in the Laplace formula and use of only an approximate solution to the electrostatic cone problem. Finally a quasi-empirical method is suggested for the self-consistent solution of the variational equations. (10 refs.)

118031 Two-dimensional potential fields between sine-wave shaped electrodes. W.Reibetanz, M.Schilling, H.Liebscher (Tech. Hochschule Ilmenau, Ilmenau, Germany).
Wiss. Z. Tech. Hochsch. Ilmenau (Germany), vol.29, no.3, p.95-104 (1983). In German.
Analyses the potential field between electrodes which have either parallel gaps meandering in the form of sine waves, or sinusoidally varying gaps between a periodic surface and a flat surface. Analysis is carried out in successive narrow strips and it is concluded that relative field strength approaches a limiting value as gap width is increased and that the field strength modulation along the gap is small. Outputs from a simulation on a type EC1040 computer are appended. (7 refs.) *G.M.E.*

118032 Introduction to moment methods with simple applications. C.M.Butler (Dept. of Electrical Engng., Univ. of Mississippi, University, MS, USA).
Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute, Norwich, England, 23 July-4 Aug. 1979 (Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981), p.3-55
The method of moments is introduced from a tutorial point of view and its application to integral equations is outlined. Methods for numerically solving simple integral equations from electrostatics are discussed, and numerical results are compared with analytical solutions in selected cases. The moment method is applied to problems of TM and TE illuminated cylinders and strips of infinite length as well as to that of wire antennas and scatterers. The presentation is introductory in nature and emphasizes basic techniques. (14 refs.)

41.10F Steady-state electromagnetic fields; electromagnetic induction

118033 Method of calculating electromagnetic and thermal fields in electrically conducting bodies during induction heating. G.S.Pisarenko, O.S.Tsibenko, O.M.Anisin.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.9, p.27-33 (1983). In Ukrainian.
A new numerical method is presented to study electromagnetic and heat fields. The method is based on nonlinear models of continuum mechanics and is applied to physical processes in different induction-heating systems. (8 refs.)

118034 Calculation of the levitation force using rare-earth permanent magnets. O.Podzimek.
Elektrotech. Obz. (Czechoslovakia), vol.72, no.8, p.440-1 (Aug. 1983). In Czech.
A simple mathematical analysis of a levitation system based on a current model of the magnet is presented and formulas for determining the forces acting within the levitation system are derived. Some experimental results reported in literature are also presented which indicate that the levitation systems using rare earth magnets are stable in the direction of the Z-axis. It is concluded that levitation systems described are constructionally simple but yield relatively large levitation forces. (1 ref.) *E.D.*

118035 Thermal limitation on the velocity of ring conductors in the case of induction axial acceleration. A.M.Baltakhanov, E.N.Ivanov.
J. Appl. Mech. & Tech. Phys. (USA), vol.23, no.6, p.773-5 (Nov.-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR)*, vol.23, no.6, p.46-51 (Nov.-Dec. 1982). [received: Sept. 1983]
The authors consider the heating which occurs when a plane metal ring is accelerated in a two-dimensional pulsed magnetic field of a single-turn inductor. (7 refs.)

118036 Natural mode methods in frequency and time domain analysis. E.K.Miller (Lawrence Livermore Lab., Livermore, CA, USA).
Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute, Norwich, England, 23 July-4 Aug. 1979 (Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981), p.173-212
Electromagnetic fields are described by second-order differential equations whose source-free solutions are exponential in the time domain. Their corresponding frequency-domain solutions are given by a series of poles in the complex frequency plane. This basic fact has led to the singularity expansion method (SEM) as a way to characterize both the transient and spectral EM fields of an object in terms of a set of common poles and residues. A condition necessary to implement the SEM is that a method must be available for finding the poles of the object. A number of techniques have been tested for obtaining the EM poles of antennas and scatterers. Prony's method is useful for not only computed or measured transient response data, but also, with slight modification, for spectral data as well. Its analytical development is outlined. Some introductory numerical results are given and its application is demonstrated for various types of data and objects. Use of poles for target identification from both transient and spectral data is considered. The discussion concludes with a demonstration of other ways in which poles can arise and be useful in electromagnetics, such as pattern synthesis and the one-dimensional inverse problem. (28 refs.)

118037 High-frequency fields excited by a line source located on a perfectly conducting concave cylindrical surface. T.Ishihara, L.B.Felsen, A.Green (Dept. of Electrical Engng., Polytech. Inst. of New York, Farmingdale, NY, USA).
Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute, Norwich, England, 23 July-4 Aug. 1979 (Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981), p.721-44
Alternative representations are obtained for the high-frequency surface field excited on a perfectly conducting concave circular cylinder by an axial magnetic line current located on the surface. Included are ray-optical, canonical integral, whispering gallery mode, and near-field formulations, and various combinations of these. Asymptotic evaluations in different parameter ranges lead to results with varying accuracy and physical content. Their utility is assessed by extensive numerical calculations and comparisons. Most intriguing is a form of the asymptotic solution that involves only a number of geometric optical rays and a number of whispering galley modes. (10 refs.)

41.10H Electromagnetic waves: theory

118038 Note on a suggested formation of charge from an electromagnetic wave. W.H.McCrea (Univ. of Sussex, Brighton, England).
J. Phys. A (GB), vol.16, no.14, p.L574-51 (1 Oct. 1983).
Jennison has described an historic experiment in which he succeeds in bringing an electromagnetic wave to rest in the laboratory. It is here pointed out that the electrostatic field could not be produced by static charge in the laboratory; the concept of the formation of such charge from the original wave therefore appears to be somewhat misdirected. (1 ref.)

118039 On the propagation of electromagnetic waves in scattering stratified media treated by the Green's method. P.Croce (Inst. d'Optique, Centre Univ. d'Orsay, Orsay, France).
J. Opt. (France), vol.14, no.4, p.213-20 (July-Aug. 1983). In French.
The purpose of this work is to simply put forward the main features and essential results derived from previous papers written by the author on the propagation of electromagnetic waves in scattering stratified media. The methods used are compared with different related techniques described elsewhere. As a start point the following approximate problem which most simply illustrates these methods known as Green's methods is treated: effects on a conducting network of changes in admittance or electrical behaviour of its components. (17 refs.)

118040 Lines of circular polarization in electromagnetic wave fields. J.F.Nye (H.H. Wills Phys. Lab., Univ. of Bristol, Bristol, England).
Proc. R. Soc. London Ser. A (GB), vol.389, no.1797, p.279-90 (8 Oct. 1983).
A monochromatic fully polarized electromagnetic wave propagating in free space possesses, in general, two families of singular lines ($\mathcal{C}$ lines) on which the transverse field is circularly polarized. The distribution of polarization ellipses around a $\mathcal{C}$ line shows that it obeys that same classification scheme as the isotropic points of a two-dimensional symmetric tensor: that is, a given section of a $\mathcal{C}$ line may belong to one of three different line patterns and it may be elliptic or hyperbolic. In addition it may be left- or right-handed. However, the way in which the polarization ellipses are executed in time shows that $\mathcal{C}$ lines may also be regarded as singularities of phase, analogous to line dislocations or interference fringes in scalar waves. From this point of view, a given line is of edge or screw type, according to its orientation, or, more generally, is a curved line of mixed edge-screw type. The whole field is divided into regions of opposite hand by surfaces $\mathcal{L}$ of linear polarization, and each family of $\mathcal{C}$ lines is confined to just one of these regions. (6 refs.)

118041 Low-frequency scattering by a perfectly conducting body. T.B.A.Senior (Radiation Labs., Univ. of Michigan, Ann Arbor, MI, USA).
Radio Sci. (USA), vol.17, no.4, p.741-6 (July-Aug. 1982). [received: Oct. 1983]
For a plane electromagnetic wave incident on a perfectly conducting body, the first two sets of terms in the low-frequency expansion of the far zone scattered field are derived. The first set consists of dipole contributions which can be expressed in terms of the electrostatic and magnetostatic potentials and the next set can be obtained from these same potentials plus one other. (12 refs.)

118042 Vector forward scattering theorem. M.A.Karam, A.K.Fung (Remote Sensing Lab., Univ. of Kansas Center for Res. Inc., Lawrence, KS, USA).
Radio Sci. (USA), vol.17, no.4, p.752-6 (July-Aug. 1982). [received: Oct. 1983]
The concept of energy balance is applied to compute the total loss (or extinction) resulting from a partially polarized plane wave impinging upon a scatter. It is shown that under the far-zone condition, the application of the stationary phase approximation leads to an expression relating the total loss to the Stokes parameters of the incident wave and the forward scattering amplitudes of the scattered wave. This relation may be referred to as the vector forward scattering theorem. For a linearly polarized incident plane wave, the result reduces correctly to the standard forward scattering theorem in the literature. (15 refs.)

118043 Approximate formulas for the fluctuation spectra of waves propagating in a turbulent medium. M.E.Gracheva, A.S.Gurvich (Inst. of Atmospheric Phys., Acad. of Sci., USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.7, p.570-5 (July 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.7, p.791-6 (July 1982). [received: Sept. 1983]
The authors propose simple formulas for approximate calculation of the spectrum and dispersion of the intensity fluctuations in a plane monochromatic wave propagating in a turbulent medium where the fluctuations in the dielectric permittivity have a Kolmogorov spectrum. A numerical calculation with their proposed formulas is in satisfactory agreement with an accurate calculation of Gurvich et al. (1979) and with experimental data of Gurvich et al. (1975) and Gracheva et al. (1981). (12 refs.)

118044 Conditions for applicability of geometric diffraction theory. Yu.A.Kravtsov (P.N. Lebedev Phys. Inst., Acad. of Sci., USSR), Yu.I.Orlov.
Radiophys. & Quantum Electron. (USA), vol.25, no.7, p.582-90 (July 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.7, p.805-14 (July 1982). [received: Sept. 1983]
Heuristic criteria are proposed for the applicability of geometric diffraction theory, based on the concept of diffraction-ray Fresnel volumes, i.e. regions essential for diffraction. The proposed criteria are reducible to the requirement that within the limits of the Fresnel volumes those quantities which are strictly constant in the original reference diffraction problem from which the diffraction coefficients are taken must be practically constant. Examples of the use of these criteria are presented and several related questions are considered—determination of fields in regions of nonapplicability of geometric theory, 'instability' of diffraction rays, choice of idealized diffraction models, etc. (22 refs.)

118045 Radiation of a charged filament within a moving diffuse boundary between two media. V.A.Davydov, V.V.Kolesov (Moscow State Univ., Moscow, USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.7, p.591-5 (July 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.7, p.815-19 (July 1982). [received: Sept. 1983]
The radiation produced by a charged filament as the moving diffuse boundary between two media moves over it is considered. The cases of finite and infinite filament are analyzed, and expressions are obtained for the spectral and angular distributions of the radiant energy. (4 refs.)

118046 Interaction of electromagnetic waves in a classical superlattice. A.M.Belyantsev, V.I.Shashkin (Inst. of Appl. Phys., Acad. of Sci., USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.7, p.606-12 (July 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.7, p.833-40 (July 1982). [received: Sept. 1983]
The interaction of electromagnetic waves upon propagation in an artificial dielectric of the classical superlattice type is investigated theoretically. It is shown that when waves propagate in such structures, effective parametric amplification of radiation of the millimeter and submillimeter wavelength regions and frequency conversion are possible. (12 refs.)

118047 Electromagnetic and acoustic resonance scattering theory. H.Uberall, P.J.Moser, J.D.Murphy, A.Nagl, G.Igiri, J.V.Subrahmanyam (Dept. of Phys., Catholic Univ., Washington, DC, USA), G.C.Gaungaurd, D.Brill, P.P.Delsanto, J.D.Alemar, E.Rosario.
Wave Motion (Netherlands), vol.5, no.4, p.307-29 (Aug. 1983).
The excitation of the eigenfrequencies of finite radar or sonar targets of inhomogeneities in elastic materials, of geological strata or of the entire earth by the impact of propagating waves (of electromagnetic or acoustic nature, or of ultrasonic, elastic or seismic character, respectively) manifests itself in the appearance of poles in the resulting wave amplitudes as described by the Resonance Scattering Theory. In the complex frequency plane, these poles relate to the ringing of the scattering resonances. In the complex mode number plane, corresponding poles are connected with circumferential or creeping waves. An analytic relation between these two descriptions is indicated, and a number of examples from the above-mentioned fields are discussed. The concepts of 'acoustic spectroscopy' and of 'radar spectroscopy' are introduced. (46 refs.)

118048 Present thinking on the use of the singularity expansion in electromagnetic scattering computation. L.W.Pearson (Dept. of Electrical Engng., Univ. of Mississippi, University, MS, USA).
Wave Motion (Netherlands), vol.5, no.4, p.355-68 (Aug. 1983).
While the singularity expansion of electromagnetic scattering responses has received a great deal of attention, a number of uncertainties has persisted in connection with its applicability and completeness. Recently, the dominant questions have been clarified, at least for one with pragmatic computational goals. The author surveys the present understanding of the singularity expansion from the pragmatist's point-of-view. Attention is given to recent work which clarifies points which have been debated in the past. The interpretation of the expansion in the presence of a time-limited excitation function is discussed. Various means for determining the expansion parameters for a given object are surveyed. (33 refs.)

118049 Parametric identification of transient electromagnetic systems. D.G.Dudley (Dept. of Electrical Engng., Univ. of Arizona, Tucson, AZ, USA).
Wave Motion (Netherlands), vol.5, no.4, p.369-84 (Aug. 1983).
Data into and out of a transient electromagnetic system are considered in the framework of modern system identification. System solutions that take the form of a complex exponential series are discussed. Since the identification of the parameters in the series is non-linear, emphasis shifts to the identification of the parameters in the difference equation whose solution is the exponential series. The subject is cast in the formalism of system identification with generalizations to more complex systems. Two examples are given, one involving an actual electromagnetic experiment. (23 refs.)

118050 Propagation constraints in the millimetre wavebands due to precipitation scattering. B.G.Evans, A.R.Holt (Univ. of Essex, Wivenoe Park, Colchester, England).
AGARD Conference Proceedings No.332. Propagation Aspects of Frequency Sharing, Interference and System Diversity. 31st Symposium of the Electromagnetic Wave Propagation Panel, Issy-les-Moulineaux, France, 18-22 Oct. 1982 (Neuilly-sur-Seine, France: AGARD 1983), p.23/1-10
Presents theoretically derived forward and backward scattering calculations for precipitation up to 210 GHz. Simple scaling rules are investigated for forward and backward directions which will allow scattering parameters at one frequency to be derived from other frequencies thus obviating the need for exhaustive and complex calculations. Predictions of propagation degradations for communication and radar systems operating in the millimetre wave bands are given. (13 refs.)

118051 Surface integral equations for conducting and dielectric bodies. R.F.Harrington, J.R.Mautz (Dept. of Electrical & Computer Engng., Univ. Syracuse, Syracuse, NY, USA).
Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute, Norwich, England, 23 July-4 Aug. 1979 (Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981), p.97-116
The problems of electromagnetic radiation and scattering by conducting and dielectric bodies are discussed in terms of surface integral equations. It is shown that the usual H-field and E-field surface integral equations for conducting bodies fail to give unique solutions whenever the surface, when covered by an electric conductor, forms a resonant cavity. Two formulations which overcome this difficulty are the combined-field and combined-source formulations. It is shown that these two formulations always have a unique solution. Computations are given which serve to illustrate these theoretical predictions. (22 refs.)

118052 Aperture problems. J.Van Bladel (Lab. voor Elektromagnetisme en Acustica, Rijksuniv.-Gent, Ghent, Belgium), C.M.Butler.
Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute, Norwich, England, 23 July-4 Aug. 1979 (Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981), p.117-72
The problem of apertures in a plane metallic screen provides a foundation for the study of the fundamental electromagnetic boundary value problems involving apertures or holes in conducting planar surfaces. The results are general in that they are also relevant for small apertures in curved surfaces (apertures in cavities and waveguides). The coupling between an abject and an aperture in a screen is also investigated. Integro-differential equations are formulated for the case of a perfectly conducting scatterer and an aperture, both of which are of arbitrary shape, with full account taken of the coupling between the aperture and the scatterer. The general equations are specialized to apertures and scatterers of interest, and selected data are presented. (45 refs.)

118053 Direct time-domain techniques for transient radiation and scattering-wires. E.K.Miller, J.A.Landt (Lawrence Livermore Lab., Livermore, CA, USA).
Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute, Norwich, England, 23 July-4 Aug. 1979 (Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981), p.213-53
Provides a brief tutorial introduction to transient electromagnetics, focusing on direct time-domain techniques. Physical, mathematical, and numerical aspects of time-domain methods are examined with emphasis on wire objects excited as antennas or scatterers. Numerous computed examples illustrate the characteristics of direct time-domain procedures, especially where they may offer advantages over the more familiar frequency-domain techniques. These advantages include greater solution efficiency for many types of problems, the ability to handle nonlinearities, improved physical insight and interpretability, availability of wide-band information from a single calculation, and the possibility of isolating interactions among various parts of an object using time-range gating. (38 refs.)

118054 Time domain solutions via integral equations—surfaces and composite bodies. C.L.Bennett (Sperry Res. Center, Sudbury, MA, USA).
Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute, Norwich, England, 23 July-4 Aug. 1979 (Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981), p.255-75
Discusses the time domain solution of scattering by conducting closed surfaces, open thin surfaces, surfaces with wires, and surfaces with fins. A brief description of the space-time integral equations that describe these problems is followed by a discussion of the marching on in time numerical solution procedure. Smoothed impulse responses for selected targets in these classes are presented, discussed, and compared with companion time domain measurements. Finally a description of the impulse response augmentation technique which yields an estimate of the impulse response is presented. (27 refs.)

118055 Inverse scattering. C.L.Bennett (Sperry Res. Center, Sudbury, MA, USA).
Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute, Norwich, England, 23 July-4 Aug. 1979 (Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981), p.277-97
The inverse scattering problem, briefly stated, is to find the shape and constitutive characteristics of a scattering target when given the knowledge of the incident field and the resulting scattered field data. Over the past two decades interest has developed in the solution of the electromagnetic inverse scattering problem and, more recently, this interest has been heightened by the quest to develop target recognition techniques using radar. The author reviews progress in inverse scattering over the past two decades by describing a representative number of techniques that have been developed. The use of the physical optics or Kirchoff approximation as a basis for the solution of the problem is reviewed and discussed in both the time domain and in the frequency domain. 'Exact' techniques in the frequency domain that require knowledge of the far scattered field over a substantial portion of the enclosing sphere are considered. Next, 'exact' time domain techniques that are based on the time domain sequential solution of a space-time integral equation are described. Finally a description of techniques that are based on currently available radar observables such as radar cross section at multiple frequencies are presented. (30 refs.)

118056 On using isoperimetric inequalities and isoperimetric quotients in electromagnetic theory and applied physics. D.L.Jaggard (Dept. of Electrical Engng., Univ. of Utah, Salt Lake City, UT, USA).
Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute, Norwich, England, 23 July-4 Aug. 1979 (Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981), p.319-41
Presents an alternative method of solving boundary-value problems. The method, based on certain isoperimetric inequalities, produces two-sided bounds on the value of physical quantities such as capacitance, aperture transmission coefficients, scattering cross sections, and the equivalent radii of wires. The results, which are valid in the low frequency regime, have the virtue of simplicity. In addition, these bounds show how the boundary must be altered to optimize the physical quantity under consideration. (31 refs.)

118057 Uniform theories of diffraction by edges. G.A.Deschamps (Dept. of Electrical Engng., Univ. of Illinois, Urbana, IL, USA).
Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute, Norwich, England, 23 July-4 Aug. 1979 (Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981), p.477-95
The geometrical theory of diffraction GTD has well known shortcomings when applied in some transition regions such as the vicinity of shadows boundaries or caustic surfaces. Uniform theories provide field descriptions valid in these regions. The author considers more specifically diffraction by the edge of a screen and describes and compares two competing theories that give the field near to shadow boundaries. (31 refs.)

118058 A uniform GTD for the diffraction by edges, vertices and convex surfaces. R.G.Kouyoumjian, P.H.Pathak, W.D.Burnside (Dept. of Electrical Engng., Ohio State Univ., Columbus, OH, USA).
Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute, Norwich, England, 23 July-4 Aug. 1979 (Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981), p.497-561
When a radiating object is large in terms of wavelength, the scattering and diffraction are found to be essentially a local phenomenon associated with specific parts of the object, e.g. specular reflection, shadow boundaries, and edges. The high-frequency approach which the authors employ uses rays in a systematic way to describe this phenomenon. It was originally developed by Keller and his associates at the Courant Institute of Mathematical Sciences and is referred to as the geometrical theory of diffraction (GTD). The GTD is an extension of geometrical optics in which rays diffracted from edges, vertices and convex surfaces are introduced through a generalization of Fermat's Principle. In its original form, the GTD fails in the transition regions adjacent to shadow and reflection boundaries, to overcome this and other limitations in the GTD has resulted in the new uniform GTD (UTD) which provides expressions for the diffracted field so that the total high-frequency field is continuous at shadow and reflection boundaries. Uniform expressions have been found for electromagnetic fields diffracted from edges and vertices in perfectly-conducting surfaces and for the diffracted fields due to sources either on or off perfectly-conducting convex surfaces. (50 refs.)

118059 Introduction to GTD applications. H.Bach (Electromagnetics Inst., Tech. Univ. of Denmark, Lyngby, Denmark).
Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute, Norwich, England, 23 July-4 Aug. 1979 (Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981), p.563-94
Shows that whilst the application of the GTD to actual radiation problems is in principle simple, in practice the situation is not so straightforward due to a number of problems which can arise, such as; the necessity to solve ray tracing problems numerically, unknown diffraction coefficients and the fact that GTD breaks down in certain regions. The main advantage of a GTD solution is that it is valid for large scatterers ($d \gg \lambda$) where the Moment Methods often become unapplicable. Furthermore, GTD programs are fast programs and their speed of computation does not depend on size. The GTD is the natural tool, when high frequency antennas are placed in complex environments. The visual nature of the theory provides a clear physical insight into the effect of the scatterer upon the performance of the antenna and thus facilitates the design work in complicated practical cases. (6 refs.)

118060 GTD applications at LCT. F.A.Molinet (Lab. Central de Telecommunications, Velizy-Villacoublay, France).
Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute, Norwich, England, 23 July-4 Aug. 1979 (Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981), p.619-48
Among the GTD applications which have been treated in the last years at LCT, three topics have been selected and details are presented. The first topic concerns the development of a new hybrid method which combines the Moment Method with asymptotic techniques. The principle of this technique is outlined and discussed in the special case of the wedge problem. Numerical results are shown and compared with those obtained by other authors. The second topic concerns the application of GTD on bodies for which the following techniques are needed: asymptotic development of physical optics integrals, diffraction of creeping rays by edges, caustic corrections. The techniques used are briefly outlined and numerical results are presented and compared wih measurements. The third topic is devoted to the presentation of a general computer program for analyzing any kind of antenna mounted on an arbitrary structure consisting of plates, cylinders, spheres, cones. This analysis is accomplished by using GTD. Results obtained for antennas mounted on a satellite are given. (8 refs.)

118061 Transform approach to electromagnetic scattering. R.Mittra (Dept. of Electrical Engng., Univ. of Illinois, Urbana), Y.Rahmat-Samii, W.L.Ko.
Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute, Norwich, England, 23 July-4 Aug. 1979 (Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981), p.649-95
For frequencies above the resonance region, the transform technique has been found useful for deriving efficient numerical solutions to radiation and scattering problems by combining integral-equation formulation with asymptotic techniques in the transform domain. Recent studies have shown that the scope of application can be considerably enlarged while simultaneously improving the efficiency of computation by incorporating the existing high-frequency asymptotic solutions into the solution procedure. Consequently, the authors focus mainly on this combination procedure which appears to offer the greatest potential for systematic and accurate solutions to radiation and scattering problems in the resonance region and above. (35 refs.)

118062 Some useful asymptotic and numerical techniques for solving high-frequency scattering problems. Y.Rahmat-Samii (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).
Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute, Norwich, England, 23 July-4 Aug. 1979 (Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981), p.697-719
The author's aims are firstly to conduct an analytical and numerical comparison among various widely used asymptotic theories in high-frequency electromagnetic diffraction and secondly to demonstrate the application of the Bessel-Jacobi series for the efficient and accurate evaluation of the radiation integral for offset reflector antennas. Only the basic concepts and final results are reported. (27 refs.)

118063 Evanescent waves. L.B.Felsen (Dept. of Electrical Engng., Polytech. Inst. of New York, Farmingdale, NY, USA).
Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute, Norwich, England, 23 July-4 Aug. 1979 (Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981), p.767-77
The modal view of evanescent fields is unnecessarily restrictive. For nonevanescent fields it has long been recognized that modal representations are not the most useful formulations of certain field problems. Thus, in the range of short wavelengths in a free space or large-waveguide environment, ray-optical representations describe the field more compactly and with deeper physical content. Such ray-optical formulations are based on the local character of short-wavelength propagation and permit the tracking of fields in terms of local plane waves along ray trajectories that may intercept boundaries, scatterers, and other perturbations in the local propagation environment. Such local tracking is not possible for modal fields because of their inherent global character. The established versatility of ray (i.e. local wave tracking) methods for nonevanescent fields has motivated the study of similar methods for evanescent fields and the author reviews these developments. (17 refs.)

118064 The correct expression for the chromatic disc of confusion. J.Orloff (Oregon Graduate Center, Beaverton, OR, USA).
Optik (Germany), vol.65, no.3, p.263-5 (1983).
In order to calculate the properties of optical systems limited by the energy spread of a beam of charged particles, it is necessary to be able to accurately estimate the disc of confusion due to chromatic aberration. It is pointed out that an expression commonly used in electron microscopy is too large by a factor of 2. (4 refs.)

118065 Statistical limitations in electron beam lithography. I. Theory. J.M.J.van Leeuwen, G.H.Jansen (Lab. voor Tech. Natuurkunde, Tech. Hogeschool Delft, Delft, Netherlands).
Optik (Germany), vol.65, no.3, p.179-207 (1983).
A discussion is given of the influence of the interactions between individual electrons on the beam qualities. The statistical and dynamical aspects of this many particle problem are reduced to a two particle problem. Boersch effect and trajectory displacement are calculated for a simple geometry with a narrow crossover. It is found that these statistical effects put a limit on the brightness of a beam and the dependence of this limiting brightness on the system parameters is made explicit. (11 refs.)

118066 Computer-aided calculation of the aberration coefficients of microwave cavity lenses. II. P.W.Hawkes (Lab. d'Optique Electronique, CNRS, Toulouse, France).
Optik (Germany), vol.65, no.3, p.227-51 (1983).
For pt.I see ibid., vol.63, p.129 (1983). A full list of the third-order spatial and temporal aberration coefficients of microwave cavity lenses is given, applicable for any frequency and electron energy. The spatial aberrations are considered only in the geometrical image plane but the temporal aberrations are given in a general plane. Nevertheless, sufficient details are provided to permit the reader to evaluate the spatial aberration coefficients in a general plane, the temporal image plane when this exists, for example, if required. 42.10 PROPAGATION AND TRANSMISSION IN HOMOGENEOUS MEDIA

118067 Aspects of light scattering by spherical particles. L.E.Drain, N.Smith, W.Dalzell (Materials Phys. Div., AERE, Harwell, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.610-15 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Calculations of light scattering from transparent spherical particles under various polarization conditions have been made by the Mie theory with a view to assessing optical drop sizing techniques. Some interesting features revealed by detailed calculations are reported and illustrated by experimental observations. In forward scatter, there are fine details of the scattering pattern which are critically dependent on drop size. In back scatter, the intensity is found to be a rapidly varying function of particle diameter but under certain conditions of circular polarization, the scattering pattern is very regular and may be explained by a type of diffraction theory. (5 refs.)

118068 Rigorous diffraction theory applied to video disk geometries. J.H.T.Pasman (Philips Res. Lab., Eindhoven, Netherlands).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.674-80 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Briefly describes the principles of the recording and read-out of optical video discs, and presents a method to inspect pit geometries. The pit structure on the disc containing the video information is considered to act as a biaxial grating. It is shown that when continuous grooves are recorded on a disc, diffraction experiments give the dimensions of these grooves by comparing them to results of rigorous theory of diffraction by a finitely conducting uniaxial periodic structure with polygonal height profile. This measuring technique yields a precision of 3 nm in depth, 25 nm in width and 3° in slope. (11 refs.)

118069 Detection of hidden diffractors by coherence measurements. A.S.Glass, H.P.Baltes (Landis & Gyr Zug AG, Zug, Switzerland), K.M.Jauch.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.681-6 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
The scattering of partially coherent radiation by structures such as diffraction gratings is analysed theoretically. The far-zone intensity and degree of coherence patterns are obtained in terms of relevant source parameters such as coherence length, beam width, phase curvature, and the properties of the diffracting structure. Particularly noteworthy is the fact that for relatively low source correlation lengths, far-zone coherence measurements can detect evidence of the diffracting structures even though the radiant intensity may be completely diffuse. This phenomenon has potential application to the coding and detection of optical information. Recent experiments do indeed corroborate these predictions. (15 refs.)

118070 Measurement of coherence of radiation from diffusely illuminated beam splitters. K.M.Jauch (Sodeco-Saia SA, Geneva, Switzerland), H.P.Baltes, A.S.Glass.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.687-90 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
A variation of the Mach-Zehnder interferometric arrangement was used to show that both reversing and nonreversing wavefronts produce peaks of the coherent function in the far zone when a beam splitter (such as a semi-mirror or a grating) is illuminated by diffuse laser light. The reversing case produces a much narrower coherent angle than the non-reversing case, which, in turn, can be much narrower than the diffuse radiant intensity pattern. A beam splitter hidden behind such a diffuser and detectable only by means of a coherent optical setup has potential applications for optical coding. (11 refs.)

118071 Generalized dispersion relation for optical constants. K.-E.Peiponen (Dept. of Math. & Phys., Univ. of Joensuu, Joensuu, Finland).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.696-9 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
A generalized dispersion relation is given which is not restricted by the demand of analyticity of the optical constant. Sum rules are also given with the aid of the generalized dispersion relation. (17 refs.)

118072 Optical activity and rotary dichroism in light- and electron-optics. P.S.Farago, R.M.Sillitto (Phys. Dept., Univ. of Edinburgh, Edinburgh, Scotland).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.702-14 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
When electron beams of low energy ($E<25$ eV (say) $\lambda>.25$ nm) pass through matter, effects should occur analogous to optical activity and rotary dichroism in light-optics. The possible effects are described, and are discussed on the basis of Born's explanation of dichroism; the opposite is expected in electron-optics. The possibility of observing these effects in electron-scattering from asymmetric molecules is discussed in relation to experiments, performed and proposed. (6 refs.)

118073 Stability of radiation-pressure particle traps: an optical Earnshaw theorem. A.Ashkin, J.P.Gordon (Bell Labs., Holmdel, NJ, USA).
Opt. Lett. (USA), vol.8, no.10, p.511-13 (Oct. 1983).
The authors prove an optical radiation Earnshaw theorem: a small dielectric particle cannot be trapped by using only the scattering force of optical radiation pressure. A corollary is that the gradient or dipole force is necessary to any successful optical trap. The authors discuss the implications of the theorem for recent proposals for the optical trapping of neutral atoms. (23 refs.)

118074 Synthesis of optical films during oblique incidence of light. A.G.Sveshnikov, A.V.Tikhonravov, S.A.Yanshin.
Zh. Vychisl. Mat. & Mat. Fiz. (USSR), vol.23, no.4, p.929-35 (July-Aug. 1983). In Russian. English translation in: *USSR Comput. Math. & Math. Phys. (GB)*
A general formulation of the problem of the synthesis of optical films is given for the case of the oblique incidence of plane electromagnetic waves. Necessary conditions for optimization are investigated. A method and an algorithm for the synthesis of such films are proposed and examples of synthesis carried out according to the program which has been developed are presented. (6 refs.) *A.G.C.*

118075 Introduction to geometrical optics. S.Cornbleet (Dept. of Phys., Univ. of Surrey, Guildford, England).
Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute, Norwich, England, 23 July-4 Aug. 1979 (Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981), p.423-37
The complete solution of a problem involving the interaction of an electromagnetic field with material bodies, has only been obtained exactly for a very few fundamental problems, where as some extremely complicated optical systems can be derived with comparative simplicity by geometrical methods. The procedure of recent times has become one of stretching both of the underlying concepts towards meeting and even of overlapping. This means including in the term 'geometrical optics' some concepts conventionally approached by EM theory and to evaluate some of the more intractable EM Problems by methods adopted from geometrical optics. This diffuses the boundary of what one calls geometrical optics considerably. One can have on one hand a geometrical optics theory of diffraction and obtain on the other hand an asymptotic EM solution in the geometrical optics limit. The author discusses Fermat's principle, conservation laws and the radiated field. (38 refs.)

118076 Foundations of the geometrical theory of diffraction. L.B.Felsen (Polytech. Inst. of New York, Farmingdale, NY, USA).
Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute, Norwich, England, 23 July-4 Aug. 1979 (Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981), p.439-54
Discusses the ray method, equations for the ray-optical field and their solution, and asymptotic expansions. (4 refs.)

118077 Canonical problems and diffraction coefficients. P.L.Christiansen (Lab. of Appl. Math. Phys., Tech. Univ. of Denmark, Lyngby, Denmark).
Theoretical Methods for Determining the Interaction of Electromagnetic Waves with Structures. Proceedings of a NATO Advanced Study Institute, Norwich, England, 23 July-4 Aug. 1979 (Alphen aan den Rijn, Netherlands: Sijthoff & Noordhoff 1981), p.455-75
Introduces the theory of geometrical optics (GO) and the geometrical theory of diffraction (GTD). The solution of some canonical problems and extraction of GO and GTD scattering coefficients are considered. The scattering coefficients derived may be combined into hybrid scattering coefficients for complex processes. (4 refs.)

42.20 PROPAGATION AND TRANSMISSION IN INHOMOGENEOUS MEDIA

118078 Pseudoreversal contrast for speckle photography. M.Garcia, P.Mendez, J.M.Cuadrado (Dept. de Optica, Univ. Complutense, Madrid, Spain).
An. Fis. Ser. B (Spain), vol.79, no.2, p.85-9 (May-Aug. 1983). In Spanish. [received: Oct. 1983]
The effect of 'pseudoreversal contrast' when the various speckle patterns are recorded on the same photographic plate with a small displacement of the plate between the exposures is analyzed. A interpretation is proposed and experimental confirmation given. (7 refs.)

118079 Modified Monte-Carlo method to evaluate multiple scattering effects on lightbeam transmission through a turbid atmosphere. P.Bruscaglioni, A.Ismaelli, G.Zaccanti (Istituto di Fisica Superiore, Univ. di Firenze, Firenze, Italy), L.Pantani.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.164-73 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
A modified Monte-Carlo method is presented, suitable for evaluating the contribution of different orders of scattering to the power transmitted through a turbid atmosphere. The results of numerical calculations performed by using scalar scattering functions are also shown. (7 refs.)

118080 Eikonal approximation to small angle light scattering from absorbing fibres. S.K.Sharma, D.J.Somerford (Dept. of Phys., Univ. Coll. Cardiff, Cardiff, Wales).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.532-7 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
The eikonal and other approximation methods used to describe light scattering are compared with the exact theory for long absorbing fibres. Fibre diameters in the range 0.2-4.0 μm are considered. The real and imaginary refractive index values considered are 1.05, 1.10, 1.15 and 0.001, 0.01, 0.1, 1.0 respectively. The implications of these results to fibre sizing are discussed. (13 refs.)

118081 Probability density function of the intensity in partially polarized speckle fields. P.F.Steeger (Univ. Essen Gesamthochschule, Fachbereich Phys., Essen, Germany).
Opt. Lett. (USA), vol.8, no.10, p.528-30 (Oct. 1983).
A partially polarized speckle pattern is regarded as a superposition of two linearly polarized speckle patterns. The probability density function of the intensity is analytically calculated from the bivariate Rayleigh distribution. The resulting formula is compared with previous results. The negative exponential distribution is derived for a partially polarized speckle field. This result is experimentally verified. (4 refs.)

42.30 OPTICAL INFORMATION, IMAGE FORMATION AND ANALYSIS

118082 Controlled transparencies in information-processing systems. A.A.Berezhnoi, Yu.V.Popov.
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.44, no.8, p.41-8 (1980). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.44, no.8, p.1603-13 (1980). [received: Oct. 1983] (2nd All-Union Conference on 'Laser Optics', Leningrad, USSR, Jan. 1980).
Problems of application of controlled transparencies in optical systems for processing two-dimensional signals are considered. The problems discussed are illustrated with graphs and sample anisotropic records of images in electrooptical crystals. A summary table of comparative technical characteristics of controlled transparencies is included. (24 refs.)

118083 Acquisition and manipulation of image statistics. A.Canas (Optics Section, Blackett Lab. Imperial Coll., London, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.98-103 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
The basic concepts of image histogram modification are described, including in particular the technique of histogram equalisation or flattening, which is the basis for a large variety of transformations. A fast and versatile digital system is described which is capable of acquiring image histogram data, and under microprocessor control, of performing many transformations interactively. Images are input in the form of standard TV rate video signals and processed with <150 ns throughput delay. Transformation calculations are performed in well under a second. (1 ref.)

118084 Hybrid optical-digital image processing system for pattern recognition. F.Merkle, T.Lorch, T.Karte, J.Donandt (Inst. of Appl. Phys., Univ. of Heidelberg, Heidelberg, Germany).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.450-8 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
The coherent optical filtering techniques provide a general concept for the classification of patterns. The authors describe the design and testing of a hybrid optical-digital image processing system and the development of methods for a statistical expansion of the correlation signal shape because a simple correlation signal intensity measurement is in most of the applications insufficient. Six different algorithms for correlation signal evaluation are investigated. A feature reduction is achieved by a multivariate analysis. For alpha-numeric patterns modified by binary random noise, rotation, scaling and shearing high classification results have been obtained. (15 refs.)

118085 Application of Winograd's fast Fourier transform (FFT) to the calculation of diffraction optical transfer function (OTF). D.Hashmaty-Manesh, S.C.Tam (Blackett Lab., Imperial Coll. London, London, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.692-5 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Since the advent of the Cooley-Tukey FFT algorithm, many optical designers who have used the method to compute the optical transfer function with desk-top computers would welcome the availability of even faster algorithms. There has, of course, been a steady improvement in FFT techniques in the past decade or so, but it seems that Winograd's algorithm is the most encouraging yet. The authors report on the application of this new algorithm to OTF calculation and compare it with some other methods of computing the OTF. (5 refs.)

118086 On the possibility of solving the boundary problem of the three-dimensional Poisson equation using a coherent optical processor. V.G.Pisarenko.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.9, p.56-9 (1983). In Ukrainian.
A computation method is suggested to construct an approximate solution to a three-dimensional boundary-value problem for the Poisson equation in a stratified medium. A circuit of a coherent optical processor implementing this method is presented. (4 refs.)

118087 Optical encrypting system. P.Callens (IBM Corp., Armonk, NY, USA).
IBM Tech. Disclosure Bull. (USA), vol.26, no.3B, p.1533-4 (Aug. 1983).
The author describes a process for encrypting a typed text through double reflections on two sets of mirrors. (no refs.)

118088 Source encoding, signal sampling and spectral band filtering for partially coherent optical signal processing. F.T.S.Yu (Dept. of Electrical Engng., Pennsylvania State Univ., University Park, PA, USA).
J. Opt. (France), vol.14, no.4, p.173-8 (July-Aug. 1983).
Relations between coherence requirement, spectral filtering, signal sampling, and source encoding are discussed. Since the spatial coherence requirement is determined by the signal processing operation, a strict spatial coherence is usually not required. The advantage of the source encoding is to relax the constraints of a physical light source so that the signal processing can be carried out with an extended incoherent source. The effect of signal sampling is to improve the temporal coherence requirement at the Fourier plane so that the spatial filtering can be carried out with a partially coherence mode. The objective of broad spectral band filtering is to carry out the signal processing over the entire spectral band of the light source so that the coherent noise can be eliminated. Since the partially coherent optical processor utilizes a broad spectral band white-light source, it is particularly suitable for color signal processing. Experimental demonstrations for the source encoding, signal sampling and spectral band filtering are included. (8 refs.)

118089 Effect of figure and waviness on image quality. J.P.Marioge, S.Slansky.
J. Opt. (France), vol.14, no.4, p.189-98 (July-Aug. 1983).
Optical surfaces have been produced for generations by a grinding process. For a few decades, new surfacing methods have been applied to obtain spherical surfaces, but more often aspherical ones. They produce very different defects. The machinings are carried out by a computer process, controlling the position of the tool, and one must particularly beware of deformations due to the fastening on the spindle and of the waviness and undulations of the surface. The authors studied the change of an image when optical surfaces near the pupil of the lens show waviness of various periods. The first computation defines the ratio of the energy diffracted outside a circle of a given radius to the total energy emitted by the diffracted pattern. The development of the image of extended objects is studied for the image of a field edge and the image of a sine grating (transfer function). (7 refs.)

118090 The use of normal equations for superresolution problems. H.Maitre, A.J.Levy (Lab. Image, Ecole Nat. Superieure des Telecommunications, Paris, France).
J. Opt. (France), vol.14, no.4, p.205-7 (July-Aug. 1983).
In an algebraic approach, a superresolution problem is to be seen as a linear system of equations, with constraints. The authors discuss the advantages of using normal equations $D^t g = D^t f$ instead of $g = Df$ for the reconstruction of diffraction limited images on a computer, taking into account practical problems of ill-condition, noise and computer accuracy. (8 refs.)

118091 Image vignetting of the harmonic amplitude object. M.Rataj (Inst. of Design of Precise & Optical Instruments, Warsaw Tech. Univ., Warsaw, Poland).
Optik (Germany), vol.65, no.3, p.253-61 (1983).
Demonstrates vignetting effects using the wave optics approach. Different possible cases of the image vignetting are considered and the image vignetting of the harmonic spatial frequencies created in the object is pointed out as the special case of the general vignetting phenomenon. (4 refs.)

118092 Character recognition: a new multiple filter. C.Ferreira, P.Andres, E.Bonet, A.Pons, M.Aguilar (Dept. de Optica, Univ. de Valencia, Valencia, Spain).
Opt. Commun. (Netherlands), vol.47, no.3, p.177-82 (1 Sept. 1983).
A multiple filter obtained with only one exposure is proposed for character recognition by means of correlation filtering. The filter is obtained by Fourier holography from a transparency in which the different characters are matched to a determined angle among them. (19 refs.)

118093 Limit of continuous and discrete finite-band Gerchberg iterative spectrum extrapolation. C.L.Byrne (Naval Res. Lab., Washington, DC, USA), D.M.Wells.
Opt. Lett. (USA), vol.8, no.10, p.526-7 (Oct. 1983).
It is known that the Gerchberg method for iteratively extrapolating the spectrum of an object of finite support has a different limit when the infinite frequency band used in the iterations is replaced by a finite one. It is shown that, for both continuous and discrete data, this limit involves an optimal extrapolation within the finite band to minimize the component of the limit that lies beyond the object support. (8 refs.)

42.40 HOLOGRAPHY

(for acoustic holography, see 43.63)

118094 Present status of holographic laser beam dynamic correction methods. M.S.Soskin, A.I.Khizhnyak (Inst. of Phys., Acad. of Sci., Ukrainian SSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.44, no.8, p.27-32 (1980). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.44, no.8, p.1585-92 (1980). [received: Oct. 1983] (2nd All-Union Conference on 'Laser Optics', Leningrad, USSR, Jan. 1980).
The widespread use of lasers in science and engineering makes control of the spatial structure of their beams a particularly urgent problem. There are several possible approaches to its solution. The authors investigate the holographic approach in which attention is concentrated on problems of obtaining laser beams with small angular divergence. (49 refs.)

118095 Polarization holography for measuring photoinduced optical anisotropy. T.Todorov, L.Nikolova, N.Tomova, V.Dragostinova (Central Lab. of Optical Storage & Processing of Information, Bulgarian Acad. of Sci., Sofia, Bulgaria).
Appl. Phys. B (Germany), vol.B32, no.2, p.93-5 (Oct. 1983).
A new experimental method for measuring the optical anisotropy induced at photochemical reactions is proposed. The method is based on polarization holography and is a zero-background high sensitive technique. It is used to measure the molecular dichroism of fluorescein and the birefringence induced at the additional photopolymerization of PMMA. (9 refs.)

118096 Dynamic optical cross-correlator using a liquid crystal light valve for real time data input. B.Loiseaux (Lab. Central de Recherches, Thomson-CSF, Orsay, France), L.Pichon, G.Illiaquer, J.P.Huignard.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.467-72 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Coherent optical processors have interesting potential applications for pattern recognition or optical computing. A real-time cross-correlator using the dynamic holographic properties of $Bi_{12}SiO_{20}$ (B.S.O.) crystals is presented. A photo-conductor liquid crystal light valve transducer allows a real-time data input in the processor via incoherent to coherent light conversion. A classical two-lenses optical configuration is used to simultaneously record and read the dynamic phase-volume hologram photoinduced by the photorefractive B.S.O. crystal placed in the focal plane of the Fourier transform lens. Some specific properties of the dynamic correlator such as cycle time constant, spatial resolution and beam intensities are reported. Experimental cross-correlation results of various types of information written on the light valve are demonstrated. (17 refs.)

118097 Pulsed holographic nondestructive testing on aircraft. H.Fagot, P.Smigielski, F.Albe (Inst. Franco-Allemand de Recherches de Saint-Louis, Saint-Louis, France), J.-L.Arnaud.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.493-6 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
A holographic camera composed of two ruby lasers was built at ISL. It provides double exposure holograms with an adjustable time interval ranging from few ns to infinity. Various aircraft structures were first tested at ISL in laboratory conditions: honeycomb panels, wings ... The industrial tests on a military aircraft in maintenance checking were performed in a hangar of the SNIAS at Saint-Nazaire: wings, trap-door of the rear landing gear, air-brake ... Electromechanical shocks were used to make the structure vibrate and to allow a fast trigger of the lasers. This avoids disturbance due to ambient noise and vibrations. (5 refs.)

118098 Real and nonreal time holographic nondestructive test (HNDT) for painting diagnostics. S.Amadesi, A.D'Altorio, D.Paoletti (Istituto di Fisica Tecnica, Univ. di L'Aquila, L'Aquila, Italy).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.497-501 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
A holographic nondestructive test procedure as a diagnostics tool in art conservation and preservation of ancient wooden panel paintings is presented. A brief discussion of the reliability of the method is given. Some examples of experimental results are reported; they show that the defects can be detected in real and nonreal time on laboratory models, at varying depths, through ambient drift. The examination is made combining sandwich holography and real time holography, without any modification of holographic set up. (4 refs.)

118099 Measurement of curvature and bending stiffness of thin carbon composite plates using holographic interferometry. M.Marchant, M.B.Snell (Structures Dept., Royal Aircraft Establ., Farnborough, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.502-9 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Holographic interferometry has been used to measure the deflection of thin CFRP cross-ply plates under very small pure bending loads. The authors describe the design and calibration of the optical system, the method of mounting and loading the specimen, and the computation of curvature values from the fringe data, together with a brief section on the subsequent derivation of the bending stiffness. Results obtained, both for the composite material and for a control plate of aluminium alloy, are shown to be in good agreement with theory, and further applications to thick plates and those of unknown construction appear feasible. (no refs.)

118100 Multifocal holographic optical components. A.M.P.P.Leite (Phys. Dept., Univ. of Porto, Porto, Portugal).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.638-42 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Complex multifocal holographic lenses can be recorded in a single plate. Performance in accordance to each individual optical element function can be chosen through proper illumination of the plate. The basic aspects involved in their performance are reviewed and experimental results presented. (15 refs.)

118101 Some characteristics of and measurements on dichromated gelatin reflection holograms. R.A.Cullen (Optics Section, Imperial Coll. London, London, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.647-54 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Dichromated gelatin is known to be a useful photosensitive holographic recording material. The author investigated some characteristics of dichromated gelatin, with particular attention to the diffraction efficiency (typically 95-98%), reflection bandwidth and incident angle sensitivity. The dichromated gelatin preparation and processing techniques that affect these parameters are included. Applications for these holographically produced reflection filters include head-up displays, laser protection eyewear and holographic laser beam combiners. (6 refs.)

118102 Dynamic phase hologram for laser beam steering. G.Roosen, M.-T.Plantegenest (Inst. d'Optique, Orsay, France).
J. Opt. (France), vol.14, no.4, p.199-203 (July-Aug. 1983). In French.
When interacting with a dynamic hologram, a light beam experiences changes in its diffraction direction and thus deflection. The hologram is recorded in a photorefractive material as a refractive index modulation induced by the interference of two light beams (control beam). The authors' method uses the variation of the induced grating parameters to monitor the deflection process. It is achieved in real time by simply shifting the wavelength of the control beam. Very large deflection angles are obtained while simultaneously maintaining the Bragg condition almost satisfied. Consequently good diffraction efficiency is ensured over the whole deflection process. Therefore this method has the potential to produce several thousand beam positions with a theoretical efficiency approaching 100%. Cascading two unidimensional cells the feasibility of a 2-D switch is demonstrated. (7 refs.)

118103 Photochemical time-domain holography of weak picosecond pulses. A.Rebane, R.Kaarli, P.Saari, A.Anijalg, K.Timpmann (Inst. of Phys., Acad. of Sci., Tartu, Estonian SSR).
Opt. Commun. (Netherlands), vol.47, no.3, p.173-6 (1 Sept. 1983).
The authors show that weak picosecond optical propagation through an absorbing medium with a photochemically burned-in persistent spectral hologram of a picosecond pulse train makes the sample emit coherently a replica of the pulse train applied in the burning-in cycle. (16 refs.)

118104 Construction of a two-dimensional colour hologram using a source encoding technique. F.T.S.Yu, G.Gheen, N.Wang (Electrical Engng. Dept., Pennsylvania State Univ., University Park, PA, USA).
Opt. & Laser Technol. (GB), vol.15, no.5, p.257-8 (Oct. 1983).
An adaptation of the source-encoded image subtraction system is used to form an in-plane holographic image of a colour transparency. The colour image can be retrieved by simple spatial filtering with a white-light optical processor. (7 refs.)

42.50 QUANTUM OPTICS

118105 Transient effects, transverse mode coupling, and diffraction in swept-gain superradiance in the nonlinear regime: evolution from the superradiant state. C.M.Bowden (Res. Directorate, US Army Missile Lab., Redstone Arsenal, AL, USA), F.P.Mattar.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.151-63 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Results of numerical calculations are presented and analyzed for pulse generation and propagation in one- and two-spacial dimensions in a medium consisting of a collection of two-level atoms which are resonantly swept-excited by an impulse excitation traveling at the speed of light in the medium. The conditions imposed for the calculation in one-special dimension are that $T_1=T_2$, where T_1 and T_2 are the single atom relaxation and dephasing times, respectively, and that the gain, g, to loss, κ, ratio $g/\kappa \gg l$, which determines the nonlinear regime for pulse evolution. In addition, the authors impose that $T_2 \gg \tau_c$, where τ_c is the characteristic superradiance cooperation time, so that the pulse evolves from conditions appropriate for superradiant pulse generation for sufficiently small values for the propagation distance z. Calculational results are reported and analyzed for the transient regime of pulse buildup through the asymptotic regime of large propagation distance z where the pulse generated exhibits steady-state behavior with regard to pulse area, energy and intensity profile. Additional results of computations are presented which incorporate transverse effects and diffraction using a Gaussian radial gain profile for the initial condition. (27 refs.)

118106 Nanosecond pulse generators for testing performance of high-speed photon counting system. T.Iwata, T.Uchida, S.Minami (Dept. of Appl. Phys., Faculty of Engng., Osaka Univ., Suita, Osaka, Japan).
J. Spectrosc. Soc. Jpn. (Japan), vol.32, no.4, p.249-54 (1983). In Japanese.
High-speed pulse generators have been designed for use to evaluate the operation and performance of the time analysers in lifetime measurement systems using the photon counting technique. One of the generators provides a pair of pulses whose separation is continuously adjustable from 0 to 230 nsec. This can be used to examine the gain and pulse pair resolution of amplifier/discriminator pairs or the differential linearity of the channel width of time analysers. The other provides pulses, the rate of which exponentially decreases with time. The decay constant is stepwisely adjustable from 20 to 100 ns. With this generator, the accurate calibration of the lifetime measurement

system can be easily performed. The width and amplitude of output pulses from both generators are approximately 2 ns and 1 V, respectively. (4 refs.)

118107 Modification of the Rabi flopping frequency in the presence of a static electric field. G.F.Thomas (Massey Coll., Univ. of Toronto, Toronto, Ontario, Canada).
Opt. Commun. (Netherlands), vol.47, no.3, p.196-8 (1 Sept. 1983).
For a two-level system the net probability for stimulated one-photon emission in the presence of a static electric field is calculated within the rotating-wave aproximation and under the assumption that the static field strength (E^S) is considerably less than the oscillating field strength (E^O). Besides contributing to the power broadening of the emission signal and the Rabi flopping frequency, the static field shifts the resonance towards the blue in the amount $2E^S/E^O$. (8 refs.)

118108 Observation of self-induced Rabi oscillations in two-level atoms excited inside a resonant cavity: the ringing regime of superradiance. Y.Kaluzny, P.Goy, M.Gross, J.M.Rainmond, S.Haroche (Lab. de Phys., Ecole Normale Superieure, Paris, France).
Phys. Rev. Lett. (USA), vol.51, no.13, p.1175-8 (26 Sept. 1983).
A collection of N Rydberg atoms and a resonant millimeter-wave cavity are shown to exchange energy back and forth at a rate $2(d/\hbar)\mathcal{E}_0\sqrt{N}$, where d is the electric dipole matrix element of the atomic transition and $\mathcal{E}_0$ the 'field per photon' in the cavity. This experiment is a demonstration of self-induced Rabi oscillations in a two-level atom system coupled to a single electromagnetic field mode and can also be considered as a very simple illustration of 'ringings' in superradiant emission. (9 refs.)

42.52 MASERS

118109 Experimental study of electrodynamic system in semiconductor maser at cyclotron resonance. A.A.Vertii, I.V.Ivanchenko, S.V.Koshevaya, O.D.Pustyl'nik, V.P.Shestopalov (Inst. of Radiophys. & Electronics, Acad. of Sci., Ukrainian SSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.7, p.601-5 (July 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.7, p.827-32 (July 1982). [received: Sept. 1983]
An experimental study was made of a quasioptical two-mirror resonator, the tank circuit of a semiconductor-type cyclotron-resonance maser, at the 75.4 GHz frequency. The spectral characteristics of the resonance system were determined for various orientations of the slit, with active semiconductor material on the plane mirror relative to the electric vector of the excitation field. An open resonator with an astigmatic mirror is proposed and examined. The results of measurements on a quasioptical resonance-type polarimeter reveal that the intrinsic electromagnetic field in the resonance cell of the oscillator device is elliptically polarized. (11 refs.)

118110 Exponent behaviors of single mode laser system with saturable absorber near threshold. Liu Jian-min (Dept. of Phys., Nanjing Univ., Nanjing, China).
Commun. Theor. Phys. (China), vol.2, no.3, p.1153-6 (1983).
The author discusses the exponential behaviors near the threshold of a single mode laser system in the presence of a saturable absorber. Four threshold exponents and four threshold amplitudes are obtained. They obey the generalized scaling laws of $z=4$. (12 refs.)

118111 Classical derivation of the laser rate equation. D.Marcuse (Crawford Hill Labs., Bell Labs., Holmdel, NJ, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.8, p.1228-31 (Aug. 1983).
The author derives the rate equation for the energy (photon) density inside the resonant cavity of a laser oscillator from Maxwell's equations. By comparison to the familiar photon rate equation, this classical derivation can be used to obtain the well-known expression for the ratio of the power that is spontaneously emitted into a single laser mode relative to the total amount of spontaneous emission. This independent derivation does not require mode counting procedures and settles the following question: what fraction of the total power that is spontaneously emitted into the wavelength range of the fluorescent linewidth is utilized for increasing the energy in a given laser mode?. (6 refs.)

118112 Radiation amplification without population inversion at transitions to autoionizing states. V.G.Arkhipkin, Yu.I.Heller (L.V. Kirensky Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR).
Phys. Lett. A (Netherlands), vol.98A, no.1-2, p.12-14 (3 Oct. 1983).
The spectrum dependence of an autoionizing resonance in photoabsorption on the autoionizing state population is studied. The possibility arises of obtaining amplified radiation in the region of the photoabsorption minimum without population inversion. The possibility of amplifying the radiation in the region of laser-induced autoionizing-like resonances in the continuum is also discussed. (9 refs.)

118113 On the use of piecewise exponential functions in transfer theory. A.V.Kondrashenko.
Zh. Vychisl. Mat. & Mat. Fiz. (USSR), vol.23, no.4, p.965-72 (July-Aug. 1983). In Russian. English translation in: *USSR Comput. Math. & Math. Phys. (GB)*
A method is proposed for the numerical integration of one-dimensional equations of radiative transfer in a laser, based on a search of their approximation solutions in the form of continuous piecewise exponential functions. From the results of calculations of a two-level model of a laser by the proposed method the practical possibility of a numerical investigation of the energy characteristics of some types of laser is shown (in particular, those in which pumping does not depend on spatial displacement and is a function only of time), using a small number of spatial points. (8 refs.) *A.G.C.*

Theory of spontaneous emission in gain-guided laser amplifiers .... See Entry 118140

42.55D CO_2 lasers

118114 Pulse-broadening mechanism in injection mode-locked TEA CO_2 lasers. F.A.van Goor (Dept. of Appl. Phys., Twente Univ. of Technol., Enschede, Netherlands).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.335-7 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
To study the pulse-broadening mechanism in an injection mode-locked TEA CO_2 laser oscillator, a train of Gaussian pulses with variable widths were injected in the slave-oscillator. Theoretical analyses and experimental data are presented of the AM mode-locked master-oscillator with an additional c.w. low-pressure gain cell in the cavity and of the broadening mechanism on the injected pulse in the slave-oscillator. (6 refs.)

118115 Thermal defocusing (LIMP) in stable CO_2 resonators. E.K.Gorton, E.W.Parcell (Royal Signals & Radar Establ., Great Malvern, England).
J. Phys. D (GB), vol.16, no.10, p.1827-35 (14 Oct. 1983).
The effect on the output of an electron beam sustained CO_2 laser due to LIMP (laser induced medium perturbation) is examined. An approximate theory is developed which leads to basic agreement with the experimental observations of beam spreading and temporal pulse structure. (10 refs.)

118116 Experimental check on a theoretical model for a CO_2 GDL based on combustion products at high stagnation temperatures. N.V.Evtyukhin, S.V.Kulikov, M.E.Solov'eva.
J. Appl. Mech. & Tech. Phys. (USA), vol.23, no.6, p.733-7 (Nov.-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR)*, vol.23, no.6, p.4-9 (Nov.-Dec. 1982). [received: Sept. 1983]
The authors have measured and calculated rate constants for vibrational energy transfer for stagnation temperatures up to 2400K for a series of multicomponent media covering almost all the limiting cases of working media for CO_2 gasdynamic lasers based on combustion products. The flow through a profiled nozzle with a fairly large degree of expansion was also examined. (24 refs.)

42.55F Inert gas lasers

118117 Investigation of the characteristics of an XeCl* discharge laser with ionization by a low-density electron beam. N.G.Basov, V.A.Danilychev, O.M.Kerimov, A.I.Milanich, T.S.Khachapuridze (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.391-3 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.643-6 (March 1983). [received: Oct. 1983]
An investigation was made of the energy, spectral, and time characteristics of an XeCl* discharge laser stabilized by an electron beam. The electron-beam current density could be reduced to 0.1 mA/cm^2. The maximum output energy of ~10 J/liter was obtained for a mixture of the HCl:Xe:Ne=1:10:500 composition at $p=4$ atm. The absorption in the region of 500 nm within the emission band of Xe_2Cl was due to the absorption by Xe in lower metastable states. (6 refs.)

118118 XeF* visible laser with selective optical excitation. V.M.Buchnev, A.D.Klementov, V.M.Nesterov, S.A.Pendyur, P.B.Sergeev, B.N.Toleutaev, S.V.Shul'ga (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.394-5 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.647-9 (March 1983). [received: Oct. 1983]
The coefficient representing utilization of the electron beam energy ($K\sim2.3\times10^{-3}$) in dissociation of XeF_2 vapor was determined. This dissociation occurred under the action of selective radiation emitted from electron-beam-excited Xe_2* dimers. Lasing was observed as a result of the *C-A* transition in the XeF* molecule ($\lambda=480$ nm) and the output energy was 3.1 mJ. (10 refs.)

42.55H Lasing action in other gas lasers

118119 Radiation characteristics of XeCl*, XeF* and XeBr* molecular lasers with beam and discharge excitation. Yu.I.Bychkov, G.A.Mesyats, V.F.Tarasenko (Inst. of Heavy Current Electronics, Acad. of Sci., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.44, no.8, p.12-16 (1980). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.44, no.8, p.1566-71 (1980). [received: Oct. 1983] (2nd All-Union Conference on 'Laser Optics', Leningrad, USSR, Jan. 1980).
The results of tests on XeF-($\lambda=351$ nm), XeCl-($\lambda=308$ nm), and XeBr-($\lambda=282$ nm) lasers with two types of excitation—electron beam and electron-beam-sustained discharge—are reported. The experiments were performed with an electron beam of comparatively short duration, ~50 nsec. The short excitation time is of interest in that it makes it possible to produce powerful pulses of radiation lasting ~20-30 nsec; in addition, it is easy to obtain high beam-current densities with a short electron-beam pulse and, consequently, the limiting characteristics of the lasers with very powerful pumping can be studied with beam excitation. When the laser is excited by an electron-beam-sustained discharge, the short excitation time results in a high ratio of discharge energy to beam energy. Thus, these considerations point up the importance of investigating the characteristics of excimer lasers excited with short-duration electron beams. (14 refs.)

118120 CW far-infrared lasing in $^{15}NH_3$, Stark resonantly pumped by a CO_2 or N_2O laser. C.Gastaud, P.Belland, M.Redon, M.Fourrier (Lab. de Dispositifs Infra-Rouge, Univ. Pierre et Marie Curie, Paris, France).
Appl. Phys. B (Germany), vol.B32, no.2, p.79-81 (Oct. 1983).
48 new resonant pumping schemes, by IR Stark tuning, have been performed on $^{15}NH_3$, with CW CO_2 and N_2O lasers. Among the 25 different FIR

wavelengths obtained, 15 correspond to new emissions, raising thus to 45 the total number of CW FIR emissions from this gas, in the presence of electric field. (6 refs.)

118121 Population inversion in thallium by flashlamp-photodissociation of TlI. G.Rinke (Lehrstuhl fur Lichttech. und Phys. Elektronik, Univ. Karlsruhe, Karlsruhe, Germany).
Appl. Phys. B (Germany), vol.B32, no.2, p.83-4 (Oct. 1983).
A population inversion between the 6 $^2P_{3/2}$ and 6 $^2P_{1/2}$ state of thallium has been achieved for the first time by incoherent photodissociation of TlI. This is accomplished by using wall-ablating flashlamps of short risetime and appropriate light filtering. The inversion lasts about 4 μs and is terminated by quenching collisions. (10 refs.)

118122 Operation and performance of the CW visible atomic mercury laser. M.D.Rabbett, S.M.Skippon, T.A.King (Phys. Dept., Univ. of Manchester, Manchester, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.328-34 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
The operating characteristics of CW atomic mercury lasers are described. Operating at 546.1 nm the laser is optically pumped by DC mercury discharge lamps. The laser has high perceptual brightness and potentially low noise and high stability. Experimental and theoretical aspects of the laser and its performance are discussed and the effectiveness of various optical coupling schemes considered. Evidence for absorption loss due to mercury dimers is presented and some results are given for direct measurement of this loss by tunable dye laser. (10 refs.)

118123 Millimeter wave spectroscopic studies of collision-induced energy transfer processes in the $^{13}CH_3F$ laser. W.H.Matteson, F.De Lucia (Dept. of Phys., Duke Univ., Durham, NC, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.8, p.1284-83 (Aug. 1983).
Millimeter wave spectroscopic techniques have been used to study the collision induced energy transfer processes that are important for the understanding of the 1.2 mm $^{13}CH_3F$ optically pumped FIR laser. In these experiments the microwave diagnostic probe is copropagated with the CO_2 laser pump beam through a gain cell. The continuous tunability and absolute frequency reference of the experimental technique have made possible a quantitative investigation of the emission/absorption profiles of approximately 25 rotational transitions. From these experimental results and a simple but accurate theoretical model, energy transfer parameters have been calculated by means of a nonlinear least squares fit. These parameters accurately account for all observations and are readily interpretable on the basis of the authors' understanding of fundamental collisional and radiative processes. (31 refs.)

118124 Penning collisions in hollow cathode He-Cd$^+$ lasers. M.D.Ainsworth, A.I.McIntosh (Dept. of Phys., Univ. of New England, Armidale, NSW, Australia).
J. Phys. D (GB), vol.16, no.10, p.L189-92 (14 Oct. 1983).
Recent publications have shown that electron impact collisions are more important than Penning collisions in populating the upper level of the 441.6 nm transition of He-Cd$^+$ lasers operated as positive column discharges. The authors present evidence that this is not the case in hollow cathode discharges. (10 refs.)

118125 Gain measurements and high resolution spectroscopy of the 546.1 nm atomic mercury laser transition. S.M.Skippon, T.A.King, M.D.Rabbett (Phys. Dept., Manchester Univ., Manchester, England).
J. Phys. D (GB), vol.16, no.10, p.1837-42 (14 Oct. 1983).
An investigation of the gain of a CW atomic mercury laser using a tunable dye laser is reported. Several isotopes are seen to be simultaneously excited and found to lase in multiple isotope mixtures. The nitrogen pressure dependence of the gain is found to be in good agreement with rate equation analyses, provided a pressure dependent loss term due to mercury dimers is taken into account. The pressure broadening of the laser transition by nitrogen has been measured to be 21.1 MHz mbar^{-1}. (12 refs.)

118126 Visible iodine and bromine laser, and coaxial discharge excited strong UV iodine laser. C.C.Chou, M.C.Tsao, M.S.Chiu (Shanghai Inst. of Laser Technol., Shanghai, China), F.Y.Chiu.
Opt. Commun. (Netherlands), vol.47, no.3, p.218-22 (1 Sept. 1983).
Nine new Br and I ion laser lines in the visible and the UV regions were observed by ordinary longitudinal pulsed discharge or coaxial pulsed discharge. This is the first time that the UV I ion laser was obtained with an output much stronger than that of ordinary pulsed ion lasers. The characteristics of the laser output were investigated in the case of coaxial discharge. (14 refs.)

118127 Anti-Stokes Raman laser emission at 149 nm in atomic bromine. J.C.White, D.Henderson (Bell Labs., Holmdel, NJ, USA).
Opt. Lett. (USA), vol.8, no.10, p.520-2 (Oct. 1983).
Upconversion of an F_2 discharge laser (157 nm) to 149 nm by means of anti-Stokes Raman laser emission in inverted, metastable Br atoms is reported. Approximately 0.1 mJ of energy in a 5-nsec-duration pulse was observed, implying a peak power of 20 kW in the VUV. This represents the first reported use of Br as an anti-Stokes laser medium and the first reported application of this technique for the upconversion of excimer or discharge lasers and is the deepest VUV wavelength yet created by this general method. (10 refs.)

118128 Characteristics of the pulse-periodic regime of excimer lasers. V.Yu.Baranov, V.M.Borisov, A.Yu.Vinokhodov, F.I.Vysikailo, Yu.B.Kiryukhin (I.V. Kurchatov Inst. of Atomic Energy, Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.318-22 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.540-6 (March 1983). [received: Oct. 1983]
An investigation was made of the influence of inhomogeneity of the gas density in the pulse-periodic regime on the average power of an excimer laser. The experimental results agreed qualitatively with the proposed model. An average power of ~130 W was obtained from a pulse-periodic XeCl excimer laser at a repetition frequency of ~500 Hz. (11 refs.)

118129 Investigation of lasing in active media utilizing transitions in manganese atoms. V.K.Isakov, S.E.Potapov.
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.348-54 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.588-97 (March 1983). [received: Oct. 1983]
A study was made of the energy characteristics and spectral composition of the radiation emitted by self-heating manganese vapor lasers as a function of their active-medium parameters and excitation conditions in discharge tubes of various diameters. The dependences obtained were used as a basis for discussing the lasing mechanism. The relationship was considered between the elementary processes occurring in the pulsed plasma discharge and the parameters of the emitted radiation. A total laser output power of 12 W, at an efficiency of 0.3%, was obtained in a 2-cm diameter tube of 200 cm^3 volume. (20 refs.)

118130 Optimization of metal vapor lasers. V.V.Buchanov, E.I.Molodykh, V.V.Tykotskii.
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.378-80 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.629-31 (March 1983). [received: Oct. 1983]
A method is proposed for the optimization of metal vapor lasers on the basis of a universal numerical calculation program and simultaneous application of an algorithm for multifactor optimization of the output parameters based on the complex Boks method and the Gel'fand-Tsetlin ravine function method. The results are given of a three-parameter optimization of a transverse-discharge copper vapor laser. (9 refs.)

118131 Lasing of CF_3I molecules in the 1-mm range. V.A.Bugaev, E.P.Shliteris (Inst. of Radio Engng. & Electronics, Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.404-6 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.658-61 (March 1983). [received: Oct. 1983]
Eight laser transitions were observed in the range 0.8-1.25 mm when CF_3I vapor was pumped by radiation from a low-pressure CO_2 laser. The observed infrared and millimeter transitions were identified. (10 refs.)

118132 A submillimeter ammonia and its deuteron-substitute optically pumped continuous laser. V.G.Gerasimov, S.F.Dyubko, M.N.Efimenko, L.D.Fesenko, V.I.Yartsev.
Ukr. Fiz. Zh. (USSR), vol.28, no.9, p.1323-7 (Sept. 1983). In Russian.
Thirty-three new generation lines for a continuous submillimeter laser with optical pumping on deuterosubstitute NH_3 molecules have been obtained for the first time. Part of the results is obtained owing to the Stark effect application for tuning frequencies of the absorbing transitions of the active medium in resonance with the CO_2-laser pumping radiation. 118133 Computation of reacting flowfield with radiation interaction in chemical lasers. V.Quan, S.F.Persselin, T.T.Yang (Rockwell Internat./Rocketdyne Div., Canoga Park, CA, USA).
AIAA J. (USA), vol.21, no.9, p.1283-8 (Sept. 1983).
A numerical procedure has been developed to provide a rapid and stable solution of the reacting and radiating flowfield in chemical laser cavities. A marching technique, implicit in both fluid mechanics and chemistry, is employed in solving the two-dimensional mixing layer equations. The aerokinetics and radiation interaction is calculated iteratively by solving the aerokinetic equations for the gain distribution and the propagation equations for the radiation field. In the iterative solution, a linearization method which leads to enhanced numerical efficiency is employed. (12 refs.)

118134 Chemical lasers: new results and ideas. A.N.Oraevskii (P.N. Lebedev Phys. Inst., Acad. of Sci., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.44, no.8, p.1-11 (1980). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.44, no.8, p.1554-65 (1980). [received: Oct. 1983] (2nd All-Union Conference on 'Laser Optics', Leningrad, USSR, Jan. 1980).
The most significant advances of recent years in the field of pulsed and continuous chemical lasers are reviewed. New ideas that may indicate the future pathways of chemical-laser development are analyzed. (47 refs.)

42.55M Lasing action in liquids and organic dyes

118135 Picosecond dye laser emission in the infrared between 1.4 and 1.8 μm. H.J.Polland, T.Elsaesser, A.Seilmeier, W.Kaiser (Dept. of Phys., Tech. Univ., Munchen, Germany), M.Kussler, N.J.Marx, B.Sens, K.H.Drexhage.
Appl. Phys. B (Germany), vol.B32, no.2, p.53-7 (Oct. 1983).
The stimulated emission of new infrared dyes was investigated. The dyes have short S_1-lifetimes between 5 and 12 ps with corresponding low fluorescence quantum efficiencies of 10^{-3} to 10^{-4}. In spite of this, 2% of the pumping energy was converted to an intense infrared pulse with frequencies between 5550 cm^{-1} (1.8 μm) and 7150 cm^{-1} (1.4 μm). The dye solutions were excited by single picosecond pulses of a Nd:glass laser in a travelling wave system consisting of a diffraction grating and a transversely pumped dye cell. The pulse duration at 6250 cm^{-1} was measured to be 6 ps. (11 refs.)

118136 Evanescent amplification in a single-mode optical fibre. W.V.Sorin, K.P.Jackson, H.J.Shaw (Edward L. Ginzton Lab., Stanford Univ., Stanford, CA, USA).
Electron. Lett. (GB), vol.19, no.20, p.820-2 (29 Sept. 1983).
By replacing a portion of the cladding of a single-mode fibre with a laser dye, amplification can be achieved by means of an evanescent field interaction. External gains as high as 22 dB have been measured by guiding both a pulsed pump and CW signal within the single-mode fibre. (5 refs.)

118137 Use of photoprotolytic reaction for extending the tuning range of the emission wavelength of a 3-methoxybenzanthrone laser. L.D.Derkacheva, A.I.Krymova, V.A.Petukhov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.384-6 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.636-8 (March 1983). [received: Oct. 1983]
An investigation was made of the luminescence and lasing characteristics of 3-methoxybenzanthrone solutions of different acidity. It was established that at a certain acidity of a solution the transfer of molecules of this dye to an excited state produced a new ionic form resulting from the attachment of a hydrogen ion. When a solution with the optimal acidity was pumped with the

second harmonic of a ruby laser, stimulated emission was observed for both ionic forms and continuous wavelength tuning was attained in the range 540-660 nm. (11 refs.)

42.55P Lasing action in semiconductors with junctions

118138 Optically pumped laser operation of InGaAsP/InGaP double heterostructures grown by metalorganic chemical vapor deposition. T.Iwamoto, K.Mori, M.Mizuta, H.Kukimoto (Imaging Sci. & Engng. Lab., Tokyo Inst. of Technol., Yokohama, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L429-31 (July 1983).
InGaAsP/InGaP double heterostructures have been grown on GaAs(100) substrates by low pressure metalorganic chemical vapor deposition. The authors have carried out a lasing experiment with a cleaved sample of $\sim$200 μm width by optical pumping. At high excitation levels, they have observed a stimulated emission of a wavelength of 717 nm at 150 k. The threshold power density is estimated to be about 4.5×10^4 W/cm^2 at this temperature. They also mention the room-temperature lasing operation of similar double heterostructure samples. (10 refs.)

118139 Life test of 30 mW GaAlAs TAL laser grown by OMVPE. J.Vilms, R.W.H.Engelmann (Hewlett-Packard Labs., Palo Alto, CA, USA).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L455-7 (July 1983).
Operating life data taken at 70 and 80°C at an output power level of 30 mW CW from one facet are presented for a protonisolated stripe, (Ga, Al)As Thin Active Layer DH laser grown by Organo-Metallic Vapor Phase Exitaxy, and mounted epi-side up on a Si submount with Sn solder. Median life of 450 h at 80°C ambient and 2500 h at 70°C ambient was observed. The failure mode is gradual increase of threshold current combined with decrease of the kink power level below the operating point. (10 refs.)

118140 Theory of spontaneous emission in gain-guided laser amplifiers. J.Arnaud (Univ. des Sci. et Tech. du Languedoc, Montpellier, France).
Electron. Lett. (GB), vol.19, no.19, p.798-800 (15 Sept. 1983).
The author gives an argument suggesting that spontaneous emission in gain-guided laser amplifiers is enhanced by a factor much smaller than the *K*-factor previously calculated. This is because the fundamental mode content of the spontaneous emission field should be calculated in the sense of the Hermitian rather than direct product at the laser output. (4 refs.)

118141 Gain measurements on semiconductor lasers by optical feedback from an external grating cavity. N.Gade, J.H.Osmundsen (Electromagnetic Inst., Tech. Univ. of Denmark, Lyngby, Denmark).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.8, p.1238-42 (Aug. 1983).
The authors report on new methods to determine the curvature around maximum of the mode gain curve of homogeneously line-broadened semiconductor lasers, either by measuring the wavelength dependence of threshold current of the laser coupled to an external grating cavity or by measuring the tuning range of the laser versus the amount of optical feedback. The authors experimentally found the mode gain width and the current-induced peak-gain wavelength shift of a GaAlAs CSP laser to 175 Å and 2.1 Å/mA, respectively. (19 refs.)

118142 Gain and carrier lifetime measurements in AlGaAs single quantum well lasers. N.K.Dutta, R.L.Hartman, W.T.Tsang (Bell Labs., Murray Hill, NJ, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.8, p.1243-6 (Aug. 1983).
The authors have measured the optical gain and carrier lifetime (τ) at threshold in AlGaAs single quantum well lasers in the temperature range 10-70°C. The small shift of the spectral position of the gain peak with increasing injection is evidence for the two-dimensional-like density of states in a quantum well. The net gain G is found to vary linearly with the current I. The observed slow decrease of dG/dI and τ with increasing temperature suggests the absence of a large temperature-dependent nonradiative carrier loss or optical absorption loss in these lasers. This is also supported by the observed low temperature dependence of the external differential quantum efficiency. (12 refs.)

118143 Two-dimensional quantum-mechanical confinement of electrons in DH lasers by strong magnetic fields. Y.Arakawa, H.Sakaki, M.Nishioka (Inst. of Industrial Sci., Univ. of Tokyo, Tokyo, Japan), N.Miura.
IEEE J. Quantum Electron. (USA), vol.QE-19, no.8, p.1255-7 (Aug. 1983).
Two-dimensional quantum-mechanical confinement of electrons in DH lasers is realized near room temperature by applying strong magnetic fields up to 32 T. In order to confirm the realization of two-dimensional quantum-mechanical confinement of electrons in such lasers, the spectral characteristics are measured. The observed shift of the lasing wavelength with magnetic fields is shown to correspond to the upward shift of the lowest Landau level with the increase of magnetic fields. (11 refs.)

118144 A study of optical amplification in a double heterostructure GaAs device using the density matrix approach. M.T.Tavis (Electronics Res. Lab., Aerospace Corp., El Segundo, CA, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.8, p.1302-11 (Aug. 1983).
A theoretical investigation of traveling wave light amplification in a GaAs double heterostructure device is presented. The analysis is self-consistent, semiclassical, and uses a density matrix formulation. Phenomenological constants are included to account for intraband relaxation processes, pumping, and spontaneous emission. The analysis is significantly different from previous rate equation approaches in that saturation effects are inherent in the results and phase information, important for coherent applications, is retained. Results presented for steady-state and pulsed operation include gain, pulse compression, multipulse effects, and the phase variation that occurs over the pulse time. (33 refs.)

118145 Temperature characteristics of double-carrier-confinement (DCC) heterojunction InGaAsP(λ=1.3 μm)/InP lasers. M.Yano, Y.Nishitani, K.Hori, M.Takusagawa (Fujitsu Labs. Ltd., Kawasaki, Japan).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.8, p.1319-27 (Aug. 1983).
Reports on a detailed study of the oscillation characteristics of double-carrier-confinement (DCC) heterojunction InGaAsP(λ=1.3 μm)/InP lasers, with special emphasis on their temperature characteristics. In addition to conventional double-heterojunction lasers, these lasers have a p-InGaAsP second active layer sandwiched between the p-InP clad layers. The spectral characteristics below threshold were examined in order to verify electron leakage beyond the heterobarrier of the p-InP thin clad layer, and to study the contribution of the second active layer to optical gain and laser action. Threshold temperature characteristics were also investigated through an analysis of the heterojunction energy band structure. The results indicate that emission from the second active layer is caused by electron leakage. In order to obtain high temperature stability for these lasers, it is essential that both the first and second active layers contribute to the optical gain spectrum and laser action. (23 refs.)

118146 Determination of p-n junctions in InP/GaInAsP laser heterostructures using a profilometer. J.Walachova, D.Nohavica (Inst. of Radio Engng. & Electronics, Czechoslovak Acad. of Sci., Prague, Czechoslovakia).
Phys. Status Solidi a (Germany), vol.79, no.1, p.K69-72 (Sept. 1983).
The knowledge of the correct position of the p-n junction in InP/GaInAsP laser heterostructures is very important for the fabrication of good lasers emitting near 1.3 μm. The method presented utilizes measurements of the doping and/or the composition profile of the heterostructure. When profiling a lightly-loaded metal probe is tracked slowly down the bevelled heterostructure. A fixed bias is applied between the probe and the bevelled heterostructure and the current through the probe is measured. This current is displayed on a chart recorder. The profiles have been measured only for one polarity (negative) of the probe. The authors find that the profiling for both polarities of the probe is very useful and by comparing these two profiles one can find the position of the p-n junction in the heterostructure. (4 refs.)

118147 Spectral gain profile of a GaAlAs injection heterolaser. I.S.Goldobin, L.A.Rivlin, A.T.Semenov, A.F.Solodkov, V.P.Tabunov, Yu.A.Tambiev, S.D.Yakubovich (All-Union Sci.-Res. Inst. of Optophys. Measurements, Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.354-7 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.598-602 (March 1983). [received: Oct. 1983]
An experimental investigation was made of the gain profile of an injection heterolaser and a satisfactory generalization of this profile was obtained in the form of expressions analogous to those that follow from the usual model of heavily doped gallium arsenide in which transitions take place between the density-of-states tail at the bottom of the conduction band and a local level, violating the selection rules on the quasimomentum. (13 refs.)

118148 Experimental investigation of inhomogeneously pumped injection lasers. V.I.Borodulin, V.P.Konyaev, E.R.Novikova, A.A.Tager, D.P.Tregub, B.B.Elenkrig (Inst. of Radio Engng. & Electronics, Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.398-401 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.652-5 (March 1983). [received: Oct. 1983]
An investigation was made of inhomogeneously pumped injection lasers in the form of $Al_xGa_{1-x}As$-GaAs double heterostructures. Bistable operation of such lasers was demonstrated and the switching time between the two states was less than 2×10^{-10} sec. A study was made of regular pulsations of the output radiation resulting from inhomogeneous pumping. The pulsation frequency was tunable up to 2 GHz and the duration of each pulsation (spike) was less than 2.5×10^{-1} sec. It was found that the pulsation frequency obeyed $f\propto(I-I_{th})^{1/2}$, where I and I_{th} are the current through the heterodiode and the threshold value of this current, respectively. 118149 Materials for quantum electronics (yttrium-aluminum garnet, lithium niobate). G.M.Zverev (Moscow Physicotech. Inst., Moscow, USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.44, no.8, p.49-54 (1980). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.44, no.8, p.1614-21 (1980). [received: Oct. 1983] (2nd All-Union Conference on 'Laser Optics', Leningrad, USSR, Jan. 1980).
The properties of yttrium-aluminum garnet (YAG) crystals that determine the parameters of lasers using YAG crystals doped with neodymium ions are considered in various operating regimes, along with certain properties of lithium niobate crystals that are significant in such lasers. Broad prospects for the use of YAG lasers are indicated and the parameters of certain series-produced lasers of this type are cited. (16 refs.)

118150 Amplified spontaneous emission in doped alkali-halides. G.P.Pazzi, M.G.Baldecchi, P.Fabeni, R.Linari, A.Ranfagni, A.Agresti (Istituto di Ricerca sulle Onde Elettromagnetiche, CNR, Firenze, Italy), M.Cetica, D.J.Simkin.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.338-44 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Considers the possibility of obtaining optical amplification in the UV/visible region by means of doped alkali-halide crystals, pumped by a nitrogen laser. The amplified spontaneous emission (ASE) technique is adopted with continuous recording of the luminescence intensity as a function of either the pump intensity or the pumped length. In the latter case the pumping beam inhomogeneity is taken into account. A CsI crystal doped with In^+ and Tl^+ was investigated at room temperature. The fast component of the emission ($\sim$10 ns) at 430 nm showed a gain of about 1.5 with a pumping of 10^4 W/cm on a length of 8 mm. There is experimental evidence that the active element is thallium after investigation on $CsI:Tl^+$ and $CsI:In^+$ crystals. Negative results of amplification for $KI:Tl^+$ and $KI:Ag^+$ were obtained. (9 refs.)

118151 Low-threshold semiconductor Raman laser. K.Suto, J.Nishizawa (Res. Inst. of Electrical Communication, Tohoku Univ., Sendai, Japan).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.8, p.1251-4 (Aug. 1983).
A semiconductor Raman laser using the longitudinal optical (LO) phonon mode of GaP has a very low threshold compared to the transverse optical (TO) phonon mode of GaP and even compared to simulated Raman scatterings in various kinds of liquids and insulating solid materials. The lowest threshold value of the pulsed input optical power is 8 kW (5×10^6 W/cm^2) at room temperature. Far infrared radiation (24.8 μm) has been generated by

placing both GaP with the LO phonon mode and GaAs with the TO phonon mode in a Fabry-Perot resonator. The maximum far infrared power has been 3 W. (7 refs.)

118152 Pulsed YAG:Nd^{3+} laser with a passive Q switch in the form of an LiF crystal containing F_2^- centers. T.T.Basiev, I.Ya.Itskhoki, B.G.Lysoi, S.B.Mirov, O.B.Cherednichenko.
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.370-2 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.619-21 (March 1983). [received: Oct. 1983]
An investigation was made of the energy characteristics of a YAG:Nd^{3+} laser subjected to pulse-periodic pumping and to passive Q switching of a resonator by an LiF crystal containing F_2^- color centers. A comparison was made of the energy of giant laser pulses obtained using passive and electrooptic switches when the pump pulse repetition frequency was up to 50 Hz. The use of a passive switch made of an LiF:F_2^- crystal under optimal lasing conditions did not reduce the energy of the output pulses of the laser compared with that attainable using an electrooptic Q switch. 42.55T Free electron lasers

118153 Free-electron lasers: prospects for advancing classical electron generators into short-wavelength bands. V.L.Bratman, N.S.Ginzburg, M.I.Petelin (Inst. of Appl. Phys., Acad. of Sci., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.44, no.8, p.33-40 (1980). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.44, no.8, p.1593-602 (1980). [received: Oct. 1983] (2nd All-Union Conference on 'Laser Optics', Leningrad, USSR, Jan. 1980).
Theoretical and experimental research toward the use of relativistic electron beams to produce electromagnetic waves in bands ranging from submillimeter to X-ray are reviewed. (32 refs.)

42.60 LASER SYSTEMS AND LASER BEAM APPLICATIONS

118154 Recent advances in laser technology. M.F.Stel'makh (Moscow Physicotech. Inst., Moscow, USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.44, no.8, p.93-7 (1980). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.44, no.8, p.1670-6 (1980). [received: Oct. 1983] (2nd All-Union Conference on 'Laser Optics', Leningrad, USSR, Jan. 1980).
Describes a new generation of 'Kvant'-series technological equipment which has been designed to make extensive use of unification and consolidation principles. These developments are based on a unified series of base-system models with YAG and neodymium-glass lasers with average or continuous radiated powders from 16 to 500 W. Seven or eight types of base model using a limited range of standard laser radiators, power sources, cooling systems, and other functional subassemblies for use in development of over 20 types of special purpose systems for various applications. (12 refs.)

118155 Picosecond spectra of gain-switched quaternary lasers. M.Osinski (Dept. of Electronics, Univ. of Southampton, Southampton, England), M.J.Adams.
Opt. Commun. (Netherlands), vol.47, no.3, p.190-2 (1 Sept. 1983).
Detailed analysis of picosecond pulse generation in 1.55 μm lasers is reported. Large dynamic linewidth ($\approx$100 GHz) is predicted for lasers driven to 10 times threshold. Spectra emitted by lasers biased below and above threshold are compared, and the spectral purity of the optical pulse is shown to improve considerably when a prebias condition above threshold is chosen. (13 refs.)

118156 Generation of single longitudinal mode pulses in passively Q-switched lasers via passive pre-lasing. S.Jackel, R.Laluz, B.Arad, A.Borowitz, S.Eliezer, M.Givon, A.Ludmirsky, H.Szichmann (Dept. of Plasma Phys., Soreq Nuclear Res. Centre, Yavne, Israel).
Opt. Commun. (Netherlands), vol.47, no.3, p.205-11 (1 Sept. 1983).
Greatly improved control over the production of single longitudinal mode (SLM) laser pulses is obtained by applying pre-lase techniques to passively Q-switched oscillators. Passive but controlled pre-lasing is obtained by forming a subcavity within the main Q-switching cavity. Use of pre-lasing and a single solid low-reflectivity etalon resulted in 96% SLM production over 5 h periods during which the oscillator fired intermittently several thousand times in a non-stabilized temperature environment and without any active feedback. (14 refs.)

118157 High-power, subpicosecond 10-μm pulse generation. P.B.Corkum (Div. of Phys., Nat. Res. Council of Canada, Ottawa, Canada).
Opt. Lett. (USA), vol.8, no.10, p.514-16 (Oct. 1983).
Two-picosecond, 10-μm pulses, generated by optical semiconductor switching, have been regeneratively amplified in a multiatmosphere TE CO$_2$ gain module. Pulses have been produced with a peak circulating energy of $\sim$15 mJ and a power density in the gain medium in excess of 10^{12} W/cm^2. A plasma-breakdown wave traveling with the regeneratively amplified pulse, combined with anomalous dispersion in the NaCl windows, has permitted compression of these pulses to less than 1 psec in duration. 42.60B Design of specific laser systems

118158 Pulsed-pump tunable lasers. V.G.Dmitriev, O.B.Cherednichenko (Moscow Physicotech. Inst., Moscow, USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.44, no.8, p.132-41 (1980). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.44, no.8, p.1720-32 (1980). [received: Oct. 1983] (2nd All-Union Conference on 'Laser Optics', Leningrad, USSR, Jan. 1980).
Reviews the most interesting advances in the design of lasers with frequency conversion in the nonlinear crystals and solutions of organic compounds with periodic (50-100 Hz) pulsed YAG-Nd^{3+} lasers as bases. The authors touch upon the following aspects of the subject; (i) certain peculiarities of second-harmonic generation (SHG) in periodic pulsed YAG-Nd^{3+} lasers, (ii) prospects for SHG in active-nonlinear media of the LiNbO$_3$:Nd^{3+} type, (iii) parametric light generation (PLG) in specially oriented LiNBo$_3$ crystals with direct pumping from YAG-Nd^{3+} lasers, (iv) initiation of PLG by an external source (injection of optical radiation), (v) the problem of covering a broad (including the UV) tuning range with organic lasers (OL) by nonlinear-optical methods, (vi) the possibility of building efficient OL with injection of external optical radiation, (vii) the design of electronically tuned OL around tunable acoustooptical filters (AOF). The authors stress that the pump source for all of the above lasing regimes and lasers is practically the same YAG-Nd^{3+} laser, which operates at high (up to 100 Hz or more) pulse repetition frequencies with Q-switching. Both the main radiation and second-harmonic (SH) radiation are used to pump the frequency converters. (19 refs.)

118159 CW Ar$^+$ laser pumped by an intense electron beam. T.Hara, Y.Sadamoto, M.Hamagaki, T.Ohgo, T.Dote (Inst. of Phys. & Chem. Res., Wako, Saitama, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L379-80 (July 1983).
Continuous-wave laser oscillation has been obtained on the 488.0 nm transition of singly ionized argon in a pure Ar plasma excited by a steady intense electron beam, of which energy and current can be independently controlled up to 300 eV and 11 A, respectively. This scheme has possibilities of increasing the efficiency, power and spectral range of ion lasers. (5 refs.)

118160 VPE-grown 1.3 μm InGaAsP/InP double-channel planar buried-heterostructure laser diode with LPE-burying layers. T.Yanase, Y.Kato, I.Mito, K.Kobayashi, H.Nishimoto, A.Usui, K.Kobayashi (Opto-Electronics Res. Lab. NEC Corp., Kawasaki, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L415-16 (July 1983).
Hydride-VPE grown 1.3 μm InGaAsP/InP double-channel planar buried-heterostructure laser diodes with LPE burying layers were fabricated. 19.5 mA CW threshold current, 47% external differential quantum efficiency, both at 25°C, 50 mW CW operation, high-temperature CW operation up to 120°C and threshold characteristic temperature T_0 as high as 72K, have been observed. (6 refs.)

118161 Selective meltbacked substrate inner-stripe AlGaAs/GaAs lasers operated under room temperature CW condition. K.K.S.Kinoshita, S.Konno, T.Tako (Res. Lab. of Precision Machinery & Electronics, Tokyo Inst. of Technol., Yokohama, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L473-5 (July 1983).
A novel lateral-mode controlled AlGaAs/GaAs inner-stripe laser is demonstrated which is fabricated by a one-step liquid phase epitaxial process using a newly developed selective meltback technique. The laser consists of V-groove substrate and six Al$_x$Ga$_{1-x}$As layers with different Al content forming a built-in rib-waveguide structure. In the fabrication, difference of meltback speed between GaAs and Al$_{0.5}$Ga$_{0.5}$As crystals was utilized. It was found that GaAs crystal was meltbacked rapidly by a factor of about fifteen compared with Al$_{0.5}$Ga$_{0.5}$As layer. The laser fabricated was operated under CW condition at 20°C with threshold current of 65 mA. (18 refs.)

118162 High-speed 1.55 μm single-longitudinal-mode ridge waveguide C^3 laser. I.P.Kaminow, J.-S.Ko, R.A.Linke, L.W.Stulz (Bell Labs., Crawford Hill Labs., Holmdel, NJ, USA).
Electron. Lett. (GB), vol.19, no.19, p.784-5 (15 Sept. 1983).
Fundamental-transverse-mode ridge waveguide laser chips were recleaved to form C^3 lasers with a single-longitudinal-mode output stabilised at a fixed wavelength over a wide range of drive currents and temperature. Lasers operated at 1.55 μm at a bit rate of 2 Gbit/s with on-off ratios greater than 10:1 and side-mode suppression greater than 1200:1. A simple method for mapping the stable operating regime is described. (12 refs.)

118163 Reliability of InGaAsP/InP buried heterostructure 1.3 μm lasers. K.Mizuishi (Central Res. Lab., Hitachi Ltd., Tokyo, Japan), M.Sawai, S.Todoroki, S.Tsuji, M.Hirao, M.Nakamura.
IEEE J. Quantum Electron. (USA), vol.QE-19, no.8, p.1294-301 (Aug. 1983).
A study was conducted of aging-induced Sn whisker growth at the surface of Au-Sn bonding solder layers around a laser chip, as well as metallurgical reactions, especially in p-side down lasers, at the interface of the solder and laser crystal just below the active layer. These phenomena cause electrical shorts in InGaAsP/InP laser diodes, which occur suddenly in devices operated for long periods without any previous symptoms having appeared in their aging characteristics. To completely eliminate such failures, a novel assembling method in which chips were mounted p-side up on semiinsulating SiC submounts using Pb-Sn solder was applied to InGaAsP/InP buried heterostructure (BH) lasers emitting at 1.3 μm. BH lasers assembled by this method do not suffer any shorting failure even after 8000 h operation under 60°C and 5 mW/facet output conditions. The small degradation rates obtained, for example 3 percent/kh (median) at 60°C, certify the reliability of these improved lasers. As long as the stripe width of the active layer was optimized to be in the range of 1.5-2.5 μm necessary for obtaining kink-free light output versus current properties, no detrimental changes in laser characteristics, including transverse and longitudinal modes and dynamic output response, were observed in aged lasers. The long-term degradation modes observed are presented, and possible causes are discussed. (16 refs.)

118164 Low-threshold InGaAsP ridge waveguide lasers at 1.3 μm. I.P.Kaminow, L.W.Stulz, J.S.Ko, A.G.Dentai, R.E.Nahory, J.C.De Winter, R.L.Hartman (Bell Labs., Holmdel, NJ, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.8, p.1312-19 (Aug. 1983).
The ridge waveguide configuration is shown to provide reliable low-threshold fundamental-transverse-mode lasers that are readily fabricated. Two variants are described: in the simple ridge laser, the 1.3 μm bandgap active layer is sandwiched between InP layers and, in the cladded ridge, the active layer is surrounded by 1.1 μm bandgap InGaAsP. Thresholds as low as 34 mA and efficiencies as high as 66 percent are observed. Output power is linear to more than 12 mW. Several lasers have been operated at 30°C for over 1500 h without measurable degradation. Selected lasers exhibit stabilized longitudinal mode behavior over extended temperature and current ranges. The potential manufacturability of this device is its most attractive feature. (17 refs.)

118165 Narrow output line from a distributed-feedback dye laser with broad-spectrum pumping. I.A.Vabishchevich, A.D.Das'ko, A.N.Rubinov, S.A.Ryzhechkin, T.Sh.Efendiev, V.A.Yakovenko (Inst. of Phys., Acad. of Sci., Minsk, Belorussian SSR).
Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.567-8 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1316-19 (Nov. 1982). [received: Sept. 1983]
The authors report a new type of distributed-feedback dye laser, which can generate a narrow output line when pumped by a broad spectrum. This new laser is distinguished by its simplicity and low cost. It consists of a cell holding a dye solution, with a transmitting phase holographic grating on its entrance face. The pump beam is incident on this grating in the direction perpendicular to its surface, and as it leaves the grating it is split into three parts, corresponding to diffraction orders +1, 0, −1 (for the particular grating period used, there are no higher orders). (3 refs.)

118166 Atmospheric-pressure electroionization CO$_2$ laser using CO$_2$:N$_2$:H$_2$O mixtures. V.N.Borisov, L.N.Vitshas, I.V.Ishtykov, A.G.Krasyukov, I.D.Matyushchenko, V.G.Naumov, V.D.Pis'mennyi, L.V.Shachkin.
Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.570-1 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1323-6 (Nov. 1982). [received: Sept. 1983]
The authors report an experimental study of the energy characteristics of an atmospheric-pressure electroionization CO$_2$ laser using a CO$_2$:N$_2$:H$_2$O mixture and operating under single-pulse conditions. Ionization is provided by an electron beam with an energy of about 160 keV, which is injected through a 35-μm aluminum foil into the discharge chamber. The beam current density beyond the foil is $J_{e0} \simeq 5.0$ mA/cm^2. The working mixture is continuously blown through the discharge chamber to maintain a constant composition. The discharge current and the voltage across the discharge chamber are measured during the pulse by a standard method. In the experiments the authors used a two-pass telescopic unstable resonator with a magnification $M=1.5$; the length of the active medium along the optical axis of the resonator was 1.5 m. The output energy was measured with an array of EP-50 cells. (11 refs.)

118167 Characteristics of some gas discharge lasers. Harith Bin Ahmad. Univ. Wales, Swansea thesis, March 1983
A nitrogen laser was designed and constructed to be used as the pump source for a tunable dye laser system. Its characteristics such as its output power dependence on the applied voltage, on the pressures of the N$_2$ gas in the cavity and on the flow rate of the N$_2$ gas in the cavity have been studied. The temporal relationship between the optical output and the discharge current was investigated and it was found that lasing action occurred as soon as the current began to discharge between the laser electrodes. The measurement indicates that the mechanism of excitation of the nitrogen laser upper level (C $^3\Pi_u$-level) is due to the direct electron impact excitation of nitrogen molecules. The coherent ultraviolet output of 337.1 nm wavelength amounted to ~100 kW in 8 nanosecond flashes repeated at a pulse repetition rate of 4 Hz were observed in this 'home-made' laser. This 'home-made' nitrogen laser was used to pump a dye laser in order to produce coherent tunable wavelength output to be used to examine the optogalvanic effect. The efficiencies of various dyes (e.g. coumarin 500, rhodamine 6G and rhodamine B) were measured. Coherent visible light output powers of up to 10 kW in 5 ns flashes were obtained from the dye laser over the wavelength range from ~480 to 640 nm, i.e. from green to red.

42.60F Laser beam modulation

118170 Design of a pulse stacker. E.M.Hodgson, C.J.Reason, I.N.Ross (Central Laser Facility, Rutherford Appleton Lab., Chilton, Didcot, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.140-5 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
The design of a simple pulse stacker is described. It enables pulses of variable duration in the nanosecond regime, and of predefined shape, to be synthesised from a short pulse. A pulse stacker of this type has been tested and used for laser compression experiments. (3 refs.)

118171 Laser pulse shaping with liquid crystals. J.A.Martin-Pereda, M.A.Muriel (Dept. de Electronica Cuantica, Ciudad Univ., Madrid, Spain).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.148-50 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
A method of unpolarized laser pulse shaping is reported. The basis of the method is the use of a hybrid optical bistable device with nematic liquid-crystals. A sample of the input light controls, by an asymmetrical electronic comparator, a 1×2 electro-optical total switch. The output pulses are reshaped and maintain the same polarization properties as the input light. From triangular input light signals, symmetrical and asymmetrical output pulses have been obtained. The minimum pulse width achieved was 0.1 msec. A representation of the output versus input light signals gives a hysteresis cycle in the asymmetrical case. (3 refs.)

118172 Intelligent attenuator for laser pulse energy and power stabilization. M.S.White, R.W.Wyatt, A.G.Brett (Laser Div., Rutherford Appleton Lab., Chilton, Didcot, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.551-6 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Encouraging preliminary results are presented from a feedforward stabilized active optical filter. Its function is to greatly reduce the shot-to-shot and dat-to-day pulse energy fluctuations commonly suffered by single shot Q-switched lasers and their associated electro-optic gates and switchouts. (2 refs.)

118173 Actively mode-locked and Q-switched YAG laser with precise synchronizability. T.Tomie, T.Kasai, M.Yano (Electrotech. Lab., Agency of Industrial Sci. & Technol., Ibaraki, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L441-3 (July 1983).
A system is described which generates synchronizable laser pulses with low temporal jitter (≲30 ps). The conventional LC discharge pumping scheme is used. The laser is actively mode-locked by an A-O modulator and Q-switched by a Pockels cell. Pulses of various widths (200 ps~1 ns) can be obtained with the use of intra-cavity etalons and variation of the RF power to the A-O modulator. The stability of the pulse energy is very high (~3%). (6 refs.)

118174 Two-dimensional simulation of a plasma KrF pulse compressor. R.Marchand, C.E.Capjack, C.R.James (Dept. of Electrical Engng., Univ. of Alberta, Edmonton, Alberta, Canada).
J. Appl. Phys. (USA), vol.54, no.9, p.4844-52 (Sept. 1983).
Results from a two-dimensional simulation of a KrF laser pulse compression to parameters relevant to laser-driven fusion are presented. The amplifying medium consists of a fully ionized hydrogen plasma cylinder. The plasma density can be adjusted so as to radially confine the laser beams and thus, alleviate the constraints on the input beam divergences. Energy transfer efficiencies of order 50% are possible for experimentally feasible laser and plasma parameters. (10 refs.)

118175 Rare earth Faraday rotator materials for lasers. M.J.Weber, E.Hildum, S.Leung, R.Morgret (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
J. Less-Common Met. (Switzerland), vol.93, no.2, p.276-7 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).
Summary form only given. Optical switches, modulators and isolators based on Faraday rotation are used in various laser systems. Important considerations for Faraday rotator materials in laser applications are the Verdet constant, the transmission (small absorption and scattering losses), the non-linear refractive index (for high power lasers where self-focusing must be controlled) and the cost. The best Faraday rotator materials for most high power lasers operating at visible or near-visible wavelengths are paramagnetic materials consisting of rare earth ions in hosts with low refractive indices. For general use, rare earths with low-lying 5d bands and a large range of transparency are most attractive; ions satisfying these criteria include Ce^{3+}, Pr^{3+}, Tb^{3+} and Eu^{2+}. In the search for improved materials the Verdet constants at optical wavelengths were measured for rare earths in many different hosts including oxide and fluoride crystals and glasses. (1 ref.)

118176 Amplitude modulation of the radiation of a CO$_2$-laser by optically controlled absorption in semiconductors. B.F.Kuntsevich, A.N.Pisarchik, V.N.Chizhevskii, V.V.Churakov.
J. Appl. Spectrosc. (USA), vol.38, no.1, p.107-12 (Jan. 1983). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.38, no.1, p.126-33 (Jan. 1983).
The authors describe the results of an experimental investigation of in-resonator amplitude modulation of the emission CW CO$_2$ laser ($\lambda=10.6$ μm) by controlled absorption by nonequilibrium carriers in semiconductor plates of Ge and GaAs. The emission of a ruby and neodymium laser was used as the controlling (modulating) signal acting on the semiconductor plate. (14 refs.)

118177 Self-modulation of radiation in a single-pulse ruby laser. V.I.Lebedev, V.A.Yurevich, A.I.Yansen'.
J. Appl. Spectrosc. (USA), vol.38, no.1, p.113-18 (Jan. 1983). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.38, no.1, p.133-8 (Jan. 1983).
The authors examine the possibility of shortening the leading edge and the total duration of a single pulse due to spontaneous variation of the Q-factor of a narrow-band selective resonator, occurring with frequency drift of the generated radiation. (8 refs.)

118178 Ultrashort optical pulse generation from microwave modulated AlGaAs diode laser with Selfoc rod resonator. Y.Tada, H.Yokoyama, H.Ito, H.Inaba (Res. Inst. of Electrical Communication, Tohoku Univ., Sendai, Japan).
Opt. Commun. (Netherlands), vol.47, no.3, p.187-9 (1 Sept. 1983).
Experimental studies were carried out to demonstrate practical feasibility for generating high-bit-rate ultrashort optical pulses from RF modulated AlGaAs diode lasers using compact Selfoc rod lens external resonators mounted on the brass heat sink for the diode laser. Measured pulse width was found to be ≈37 ps with a Lorentzian profile at modulation frequencies of 1.4 and 3.6 GHz depending on the length of the Selfoc rod lens. Evidence for regenerative amplified pulse oscillation was also obtained at 3.6 GHz repetition rate with this external cavity configuration. (16 refs.)

118179 Controlling the length of ultrashort light pulses from a Q-switched ruby laser. A.S.Kuch'yanov, V.A.Labusov, V.D.Ugozhaev, K.G.Folin (Inst. of Automation & Electrometry, Acad. of Sci., Novosibirsk, USSR).
Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.557-8 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1296-9 (Nov. 1982). [received: Sept. 1983]
The possibilities of solid state lasers as sources of ultrashort light pulses have not been fully realized by the methods which are commonly used to produce the pulses. The authors report an experimental study of a method for controlling the length (t_p) of ultrashort pulses which presents the possibility, in principle, of adjusting this length over the range $T_{2x} \gtrsim t_p \gtrsim \Delta\nu_g^{-1}$ with completely reproducible pulse characteristics t_p (T_{2x} is the axial period, and $\Delta\nu_g$ is the spectral gain width of the active medium of the laser). This method combines two other methods, which have been studied previously. The first of the component methods is the injection of an initial pulse into the resonator of a solid-state laser with a saturable absorber. The second component method is to introduce a fixed additional loss in the laser resonator at a certain stage in the generation. This additional loss essentially cancels the change in the peak intensity I_{peak} over a time interval sufficient for the saturable absorber to shorten the initial pulse to the necessary length. The shortening of t_p occurs most effectively if $I_{peak} \sim I_s$; I_s is the saturation intensity of the saturable absorber. (6 refs.)

42.60H Optical problems related to properties and interactions of laser beams

118180 A new approach to the generation of high-power nanosecond pulses in CO_2 lasers. A.J.Alcock, V.V.Apollonov, P.B.Corkum, R.S.Taylor (P.N. Lebedev Phys. Inst., Acad. of Sci., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.44, no.8, p.98-102 (1980). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.44, no.8, p.1677-82 (1980). [received: Oct. 1983] (2nd All-Union Conference on 'Laser Optics', Leningrad, USSR, Jan. 1980).
Describes a new approach to the isolation of a powerful nanosecond pulse in a CO_2 laser system which consists of combining mode locking in injection of a weak signal with saturation effects in absorbing media such as SF_6 and induced reflection or absorption right at the surface or in the interior of a semiconductor illuminated by an external source. Taken together, these effects can be used to obtain a reliable method for selection of short pulses with high output characteristics and have great potential for construction of a simple and highly efficient gas-laser system that generates short high-power pulses of radiation. (13 refs.)

118181 Active media of solid-state lasers. V.V.Osiko, A.M.Prokhorov, I.A.Shcherbakov (P.N. Lebedev Phys. Inst., Acad. of Sci., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.44, no.8, p.115-28 (1980). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.44, no.8, p.1698-715 (1980). [received: Oct. 1983] (2nd All-Union Conference on 'Laser Optics', Leningrad, USSR, Jan. 1980).
Discusses certain new trends that have arisen in the development and application of solid active media to obtain significant increases in the energy parameters of solid-state lasers and have led to the development of miniature lasers with active-medium volumes of <1 mm^3 and the creation of tunable solid-state lasers. (66 refs.)

118182 Review of laser induced damage thresholds. R.M.Wood, S.K.Sharma, P.Waite (General Electric Co. plc, Hirst Res. Centre, Wembley, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.84-7 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Reviews the mechanisms by which laser damage occurs and summarises the forms of the resulting damage which have been observed, with examples at both 1.064 and 10.6 μm. Summaries of the laser induced damage threshold measurements made on a wide range of materials, windows, mirrors and optical components are presented at both wavelengths. (3 refs.)

118183 Quantitative measurement of energy deposited in optical coatings. R.T.Bailey, F.R.Cruickshank, D.Pugh (Dept. of Pure & Appl. Chem., Univ. of Strathclyde, Glasgow, Scotland), A.McLeod.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.88-9 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982)
The measurement of energy deposited in optical coatings on windows or mirrors is necessary for the nondestructive estimation of damage thresholds which are of particular significance in laser optics. Such measurements are very difficult to perform by observing energy loss from a light beam incident on the optical element, since the absorbed energy is very low (p.p.m. range) and at these levels absorption and scattering of the light are difficult to quantify separately. The technique described offers a sensitive, noninvasive approach to calculating peak temperatures reached at the surface of the element under pulsed conditions. Results are reported for a variety of mirror surfaces and substrates. (3 refs.)

118184 Window and mirror materials for use at 10.6 micron. S.K.Sharma, P.Waite, R.M.Wood (General Electric Co., plc, Hirst Res. Centre, Wembley, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.104-9 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
The most common laser window and mirror materials for use at 10.6 μm are discussed and compared. Metal mirrors have been shown to yield high reflectance and high damage thresholds. Dielectrically coated mirrors yield ultra-high reflectances but lower damage thresholds due to coating defects. The window operational characteristics depend both on the coating and on the window substrate material. The range of available 10.6 μm transmitting substrates are discussed, their parameters analysed and their operational faults highlighted. (4 refs.)

118185 Laser induced damage in the ultraviolet. S.S.Wiseall, D.C.Emmony (Dept. of Phys., Loughborough Univ. of Technol., Loughborough, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.521-6 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
An ultra-violet laser damage and diagnostic facility has been set up. Laser induced damage threshold measurements have been made at 193 nm and 248 nm on a range of UV substrate/window materials such as fused silica, MgF_2, CaF_2 and on various excimer laser mirrors with multilayer dielectric coatings. (6 refs.)

118186 Measurement of spectra of and correlation between FM and AM noises in GaAlAs lasers. K.Kikuchi, T.Okoshi (Dept. of Electronic Engng., Univ. of Tokyo, Tokyo, Japan).
Electron. Lett. (GB), vol.19, no.20, p.812-13 (29 Sept. 1983).
The FM- and AM-noise spectra of a CSP-type GaAlAs laser, and the correlation between FM and AM noises, are measured in the frequency range below 100 kHz with the bias current as a parameter. The measured spectra consist of power-independent $1/f$ noise and power-dependent white noise components. A strong correlation is observed between the FM and AM noises when the output power is small. This fact supports the theory developed by Henry (see IEEE J. Quantum Electron., vol.QE-18, no.2, p.259-64, 1982) in which the amplitude-phase coupling causes the linewidth increase. (6 refs.)

118187 Spectrophone stabilization and offset tuning of a carbon dioxide waveguide laser. M.J.Kavaya, R.T.Menzies, U.P.Oppenheim (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.8, p.1234-8 (Aug. 1983).
A sensitive spectrophone containing CO_2 gas is incorporated into a feedback loop to stabilize the frequency of a CO_2 waveguide laser. First or second harmonic detection combined with a zero offset feature and the relatively high operating pressure of the laser allows continuous tuning of the stabilized frequency over a 400 MHz range. Frequency stability of better than ±1 MHz is achieved. (9 refs.)

118188 Spectral quality of He-Zn II and He-Cd II hollow cathode metal vapor lasers in the magnetic fields. W.Sasaki (Dept. of Electronics, Doshisha Univ., Kyoto, Japan), H.Ueda, T.Ohta.
IEEE J. Quantum Electron. (USA), vol.QE-19, no.8, p.1259-69 (Aug. 1983).
Reports the magnetic characteristics of the oscillation in the axial and transverse magnetic fields derived from the measurements for the oscillation spectra in the 492.4 nm He-Zn II, and in the simultaneously operating 537.8 and 636.0 nm He-Cd II hollow cathode lasers. The simultaneous oscillation in the He-Cd II lasers is compared to the monochromatic one in each wavelength. The experimental data in the magnetic fields are well explained by the theoretical treatment including not only Zeeman effects but also the plasma effects in which the excitation mechanisms are considered using the rate equations. The electron density in the laser plasma that depends on the magnetic fields play an important role in the excitation mechanisms. This paper proposes that the magnetic characteristics will be used for the color control of a white light laser as well as for the improvement of the monochromaticity in the anomalously broadened lasers. (9 refs.)

118189 Observation of intensity fluctuations and mode correlations in a broadband CW dye laser. L.A.Westling, M.G.Raymer (Inst. of Optics, Univ. of Rochester, Rochester, NY, USA), M.G.Sceats, D.F.Coker.
Opt. Commun. (Netherlands), vol.47, no.3, p.212-17 (1 Sept. 1983).
The authors have studied the intensity fluctuations of a free running, broadband, standing-wave CW dye laser. The intensity autocorrelation function has been measured using a frequency-doubling autocorrelator with picosecond time resolution. The measurements at low laser powers reveal the development of stable mode correlations through spatial hole burning. These mode correlations are found to disappear abruptly as the laser power is increased above a critical point. A model for describing these mode correlations and the transition to uncorrelated behavior is presented. (16 refs.)

118190 Image-converter recording of picosecond pulses emitted by an erbium laser (λ=2.94 μ) with active mode locking. K.L.Vodop'yanov, N.S.Vorob'ev, L.A.Kulevskii, A.M.Prokhorov, M.Ya.Shchelev (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.272-4 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.471-2 (March 1983). [received: Oct. 1983]
An image converter with a silver-oxygen-cesium photocathode (the red edge of the photoelectric effect was $\sim$1.3 μ) was used to determine the time characteristics of single picosecond pulses emitted by an erbium laser at the fundamental frequency (2.94 μ) and at the second harmonic (1.47 μ). The duration of the photoresponse in the case of the fundamental-frequency pulses was 45 psec and the threshold sensitivity of the system was 10^8 W/cm^2. It was found that the photoresponse of the image converter was strongly nonlinear. (5 refs.)

118191 Continuous tuning of the frequency of an NH_3 laser within the gain profile. M.Akhrarov, B.I.Vasil'ev, A.Z.Grasyuk, A.B.Yastrebkov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.357-61 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.602-7 (March 1983). [received: Oct. 1983]
Continuous frequency tuning was achieved for an NH_3 laser mixture above atmospheric pressure over a range of $\sim$0.25 cm^{-1} in the vicinity of the frequency ν_L=868 cm^{-1}. Measurements were made of the fine structure of the laser emission line due to the $sP(5,k)$ transition and of the widths of the NH_3 laser lines due to the $sP(5,k)$ and $aP(5,3)$ transition at various active-medium pressures. (9 refs.)

118192 Effects of multiple interaction in laser damage to optical materials. B.G.Gorshkov, Yu.K.Danileiko, V.N.Nikolaev, A.V.Sidorin (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.388-91 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.640-3 (March 1983). [received: Oct. 1983]
The relationship between the physical damage mechanisms in the case of single and multiple interaction is discussed. The results are reported of an experimental investigation of the process of bulk damage to optical materials as a result of repeated interaction with pulsed laser radiation (λ=1.06 μ, $\tau \approx$15 nsec). 42.60K Optical problems related to applications of laser beams

118193 Use of the laser interferometer in the calibration of numerically controlled machine tools. H.Tipton (Machine Tool Industry Res. Assoc., Macclesfield, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.376, p.15-19 (1983). (Optical Sensing Techniques, Benefits, Costs, Teddington, Middx., England, 7-8 Dec. 1982).
The laser interferometer is ideal for calibrating the linear axes of machine tools but it is not so easy to develop a satisfactory test procedure to yield values of accuracy and repeatability as might at first be expected. This problem is being studied by an ISO working group and some of the problems which arise are discussed. (4 refs.)

118194 Optical properties for an antireflection-coated LD optical switch. M.Ikeda (Nippon Telegraph & Telephone Public Corp., Tokyo, Japan).
Electron. Lett. (GB), vol.19, no.20, p.826-8 (29 Sept. 1983).
Measured optical properties for an antireflection-coated laser-diode optical switch are described. With antireflection coatings, output level stability for injection current and temperature are much improved. The input and output signal spectra are the same. (6 refs.)

118195 Production of deformed grating patterns by laser-scanning and some applications. T.Yoshizawa, H.Tashiro.
J. Jpn. Soc. Precis. Eng. (Japan), vol.49, no.6, p.698-702 (June 1983). In Japanese.
A trial is reported on producing deformed lines of an object scanned by a laser beam, that is so-called deformed grating patterns. Such properties inherent in a laser beam as being narrow in width and high in intensity can be effectively utilized for this purpose. With the aim of getting appropriate patterns, geometrical relations between a rotating mirror and an incident light are investigated, and a practical scanning apparatus is devised and manufactured as a prototype. The photographic pattern of the object with deformed grating lines reveals Moire fringes showing contour mapping when superimposed by a reference grating. Experimental applications with one pair of these patterns show that cross sections of the object can be drawn and that piling up these sections can reproduce the original shape of the subject body. (7 refs.)

118196 Measuring methods to control a high power CO_2 laser beam for material processing. R.Rothe, W.Juptner, G.Sepold (Bremer Inst. fur Angewandte Strahltech., Germany).
Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.439-44 vol.1
CO_2-lasers of the multi-kilowatt-range are increasingly used for welding, cutting, hardening and alloying materials. The results of these procedures are dependent on intensity and its distribution across the laser beam. Two similar novel techniques are presented to measure these beam data simply and economically. In both cases the beam is mechanically scanned by small metallic mirrors or a rotating disk with bores similar to a Nipkow-disk. The scanned part of the laser beam is converted to analogue electrical signals. (no refs.)

42.65 NONLINEAR OPTICS

118197 Opto-optical light deflection. G.Roosen, G.T.Sincerbox (IBM Res., San Jose, CA, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.564-9 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Light deflection is obtained by diffraction from a transient index modulation established as a grating of variable frequency by the interference of two light beams in an optical material. The authors describe a technique for altering the grating frequency by shifting only the wavelength of the control beams and the use of a novel optical system to maintain the Bragg condition over a wide range of frequencies in order to achieve light deflection without loss in efficiency. A computer simulation permits one to test various designs and to select the best configurations with emphasis on those that exhibit large angular deflections with minimum Bragg detuning. This new method of light deflection allows either discrete or continuous light scanning or modulation. The experimental results confirm the calculations and the authors have obtained angular deflection changes larger than 11 degrees from a wavelength shift smaller than 30 nm while maintaining the Bragg condition. (4 refs.)

118198 Line narrowing effect in fully resonant four wave mixing spectroscopy in solids. H.Souma (Dept. of Chem., Univ. of Pennsylvania, Philadelphia, PA, USA).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3225-32 (Sept. 1983).
The author explains the utility of third-order nonlinear susceptibility, $\chi^{(3)}(\omega_2; \pm\omega_1, \mp\omega_1, \omega_2)$ for the observation of resonances with homogeneous widths from inhomogeneously broadened distributions in three-level systems related to Raman or two-photon allowed electronic transitions. The line narrowing and high resolution capabilities are demonstrated theoretically using a model for inhomogeneous distributions of transitions in which the author regards an absorption spectrum as the composition of some inhomogeneously broadened substructures. The experimental methods to separate a signal having frequency ω_2 from ingoing beam at the same frequency are outlined.

118199 Picosecond shadow spectroscopy and refractive-index nonlinearity in semiconductors. V.P.Gribkovskii, V.A.Zyul'kov.
J. Appl. Spectrosc. (USA), vol.38, no.1, p.16-25 (Jan. 1983). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.38, no.1, p.21-6 (Jan. 1983).
Refractive-index nonlinearity is examined by picosecond shadow spectroscopy. The essence of the method is as follows: a single picosecond laser pulse produces a region of optical inhomogeneity in the semiconductor, which is then probed by a picosecond white-light pulse. The ultrashort high-power excitation produces a large change in the refractive index, while the picosecond continuum as the probe radiation provides shadow photographs of the excited region at various wavelengths and at various times after the laser pulse. One measures the spatial distribution of the probe radiation in the plane of the detector to determine the relative refractive-index change in the excited region, while the delay of the probe beam relative to the exciting one enables one to examine the time course of the effect. Single crystals CdS, ZnTe, ZnSe, ZnS, GaP are studied. (3 refs.)

118200 Self-pulsing in two-cavity optical bistability. J.S.Satchell, C.Parigger, W.J.Sandle (Dept. of Phys., Univ. of Otago, Dunedin, New Zealand).
Opt. Commun. (Netherlands), vol.47, no.3, p.230-5 (1 Sept. 1983).
The authors discuss two serially coupled ring cavities which contain media modeled by an ensemble of homogeneously broadened two-state atoms. This system produces pulsed outputs for appropriate CW inputs and values of the cooperativity parameters in the absorbtive regime. In particular, self-pulsing occurs when both stable and unstable steady-state output versus input characteristics are everywhere monotomic with positive slope. An analytic requirement for this self-pulsing is obtained in the absorptive case. (13 refs.)

42.65B General theory

118201 Nonlinear reflection of elliptically polarized light. G.B.Altshuller, V.S.Ermolaev, V.B.Karassev, S.A.Kozlov, K.I.Krylov (Leningrad Inst. of Fine Mech. & Optics, Leningrad, USSR), L.I.Pavlov.
Appl. Phys. B (Germany), vol.B32, no.2, p.97-100 (Oct. 1983).
Nonlinear reflection of elliptically polarized light waves from the interface of two isotropic transparent media is investigated for the first time. Nonlinear Fresnel formulae are obtained. It is shown that when linear refractive indices are equalized, selfdeformation of the polarization ellipse in nonlinear reflection depends only on incident light ellipticity, not upon its intensity and the angle of incidence. (8 refs.)

118202 Propagation of laser radiation in a moving delayed-response nonlinear medium. K.S.Gochelashvili, I.V.Chashei, V.I.Shishov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.410-12 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.666-9 (March 1983). [received: Oct. 1983]
A derivation is given of the second-order coherence function for the propagation of laser radiation in a moving delayed-response nonlinear medium. A

solution of this equation is used in an asymptotic analysis of fluctuations of the radiation in the case of propagation over long distances. (4 refs.)

42.65C Stimulated Raman, Brillouin and Rayleigh scattering; parametric oscillations and harmonic generation

118203 Conversion of pump radiation in luminescent substances. P.P.Pashinin, V.M.Podagaetskii (P.N. Lebedev Phys. Inst., Acad. of Sci., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.44, no.8, p.110-4 (1980). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.44, no.8, p.1691-7 (1980). [received: Oct. 1983] (2nd All-Union Conference on 'Laser Optics', Leningrad, USSR, Jan. 1980).
Possibilities for increasing the efficiencies of lasers by conversion of pump radiation in the wavelength range in which the active media absorb are discussed. Two model variants of pump-radiation converters are considered. (10 refs.)

118204 Parametric upward frequency conversion of picosecond IR pulses. B.S.Azimov, Yu.N.Karamzin, V.F.Kotov, A.K.Sukhorukova (M.V. Lomonosov Moscow State Univ., Moscow, USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.44, no.8, p.129-31 (1980). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.44, no.8, p.1716-19 (1980). [received: Oct. 1983] (2nd All-Union Conference on 'Laser Optics', Leningrad, USSR, Jan. 1980).
The authors discuss nonstationary generation of radiation at the sum frequency in a low-frequency pump field. The spectral width and shape of the excited radiation and the efficiency of the converter are investigated. Regimes in which a high-frequency wave is excited are classified on the basis of the type of manifestation of nonlinear and dispersion effects discuss the influence of second-order dispersion effects: the dispersion broadening of short pulses. (5 refs.)

118205 Present state of research and development in nonlinear-optical frequency conversion. V.D.Volosov, V.L.Strizhevskii.
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.44, no.8, p.142-59 (1980). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.44, no.8, p.1733-53 (1980). [received: Oct. 1983] (2nd All-Union Conference on 'Laser Optics', Leningrad, USSR, Jan. 1980).
The authors outline the characteristic trends of recent years, looking specifically at generation of optical harmonics and optical-frequency mixing in crystals, multiplication and mixing of optical frequencies in gaseous nonlinear-optical media and stimulated Raman scattering (SRS) lasers. (148 refs.)

118206 The temperature dependence of coherent two-photon processes in naphthalene in the strong exciton-photon coupling regime. S.H.Stevenson, G.J.Small (Dept. of Chem., Iowa State Univ., Ames, IA, USA).
Chem. Phys. Lett. (Netherlands), vol.100, no.4, p.334-9 (16 Sept. 1983).
Temperature-dependent intensity data for two-photon excitation and second harmonic generation signals phase matched onto the polariton branches of the singlet *a*-exciton of naphthalene are presented. The data are shown to be in qualitative agreement with the polariton fusion model which accounts for strong exciton-photon coupling. In this model the polariton scattering frequency and group velocity determine the branching ratios for the above signals. (25 refs.)

118207 Fast beam deflectors based on phase matching. I.Filinski, T.Skettrup (Phys. Lab. III, Tech. Univ. of Denmark, Lyngby, Denmark).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.345-9 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
The second harmonic beam in a phase matched frequency doubler crystal travels in the direction of phase matching. If the wavelength of a focused fundamental beam is changed, the phase matching direction is changed and the harmonic beam is deflected. The deflection angle and number of pixels are derived. Experimental results on a $LiIO_3$-crystal are presented. With electro-optic wavelength tuning very fast scanners (up to 10^{10} pixels/sec) can be constructed. Changes of the phase matching direction can also be obtained via the electro-optic effect. This effect is investigated, and it is found that this effect is too small for the usual nonlinear electro-optic crystals, but can be of practical importance for the nonlinear organic crystals recently discovered. (5 refs.)

118208 Generation of extreme ultraviolet radiation at 79 nm by sum frequency mixing. T.Srinivasan, H.Egger, H.Pummer, C.K.Rhodes (Dept. of Phys., Univ. of Illinois, Chicago, IL, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.8, p.1270-6 (Aug. 1983).
High brightness tunable coherent extreme ultraviolet (XUV) radiation at 79 nm with a peak power of $\sim$200 mW has been generated in H_2 gas by sum frequency mixing of two quanta from a high spectral brightness ArF* (193 nm) source with one quantum from a tunable dye laser ($\sim$436 nm). Spectroscopic application of this radiation has been demonstrated by observation of a broad ($\sim$160 cm^{-1}) autoionizing structure in Ar and narrow ($\sim$2 cm^{-1}) autoionizing features in D_2. An analysis is given which identifies the dominant molecular states involved in the nonlinear susceptibility of the medium (H_2). The frequency independent tuning behavior of the 79 nm output power observed over $\sim$300 cm^{-1} is related to the molecular structure and response of the nonlinear medium in the intense optical field. (36 refs.)

118209 Effect of group velocity mismatch on the measurement of ultrashort optical pulses via second harmonic generation. A.M.Weiner (Dept. of Electrical Engng. & Computer Sci., MIT, Cambridge, MA, USA).
IEEE J. Quantum Electron. (USA), vol.QE-19, no.8, p.1276-83 (Aug. 1983).
The use of second harmonic generation as a technique for optical pulse width measurements is analyzed to determine the effects of both phase velocity and group velocity mismatch between fundamental and second harmonic fields. An expression for the time average second harmonic energy, which except for special cases differs from the intensity autocorrelation function, is derived. For Type I phase matching, the measurement yields an apparent correlation width which can be either shorter or longer than the actual intensity correlation width, depending on the specific pulse shape. When the group velocity mismatch is nonzero, the measurement becomes sensitive to the phase matching condition. Two special pulse shapes for which the measurement is independent of group and phase velocity mismatch are the Gaussian and the single-sided exponential. (14 refs.)

118210 Degenerate four wave mixing with long range surface plasmons in attenuated total reflection geometries. G.I.Stegeman, C.Karaguleff (Arizona Res. Labs., Univ. of Arizona, Tucson, AZ, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.4853-5 (Sept. 1983).
The authors analyze the theory of degenerate four wave mixing by long range surface plasmons in an attenuated total reflection geometry. It is shown that large signal levels can be obtained with pulsed laser excitation for polydiacelyne materials. (18 refs.)

118211 Optical second harmonic generation in gases in magnetic field. H.Uchiki, H.Nakatsuka, M.Matsuoka (Dept. of Phys., Kyoto Univ., Kyoto, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3010-18 (Sept. 1983).
The authors analyze second harmonic generation in sodium vapor in a transverse magnetic field induced by the two-photon resonant excitation of the 3S-3D transition. The phenomenon is explained by the rotation of the two-photon induced quadrupole moment in the magnetic field. The analysis explains well the saturation of the intensity and rotation of the polarization of the second harmonic radiation in the higher magnetic field $\gtrsim$0.5 kG. The collisional decay rate of the coherence of the E1 forbidden transition has been measured as an application of this SHG.

118212 Non-linear susceptibility of Langmuir-Blodgett polydiacetylene thin films. F.Kajzar (DEIN/LERA, CENS, Gif-sur-Yvette, France), J.Messier, J.Zyss.
J. Phys. Colloq. (France), vol.44, no.C-3, p.709-12 (June 1983). (Conference Internationale sur la Physique et la Chimie des Polymeres Conducteurs (International Conference on the Physics and Chemistry of Polymer Conductors), Les Arcs, France, 11-15 Dec. 1982).
Third harmonic generation from thin films of polydiacetylene has been measured by transmission at 1.06 μm fundamental wavelength. The measured harmonic light intensity increases quadratically with the polymer film thickness up to about 0.5 μm. For two studied isomorphic forms of polydiacetylene ('blue' and 'red') one finds nearly the same value of nonlinear susceptibility $\chi^{(3)} \sim 1.3 \times 10^{-12}$e.s.u. (7 refs.)

118213 Optical second harmonic generation in various liquid crystalline phases. M.I.Barnik, L.M.Blinov, A.M.Dorozhkin, N.M.Shtykov (Organic Intermediates & Dyes Inst., Moscow, USSR).
Mol. Cryst. & Liq. Cryst. (GB), vol.98, no.1-4, p.1-12 (1983). (Proceedings of the Ninth International Liquid Crystal Conference, Bangalore, India, 6-10 Dec. 1982).
The zero-field and field-induced optical second harmonic generation (SHG) was investigated for the nematic and smectic A phases of various liquid crystals. The components of the cubic non-linear susceptibility tensor were measured for substances with different molecular structure. The phase-matched SHG was observed for all the compounds investigated. The directions of the phase synchronisms as well as the corresponding non-linear susceptibilities were determined for the ee-o and oe-o interactions. The zero-field phase-matched SHF was observed for the oe-o interaction. It was accounted for by a multipolar mechanism. (19 refs.)

118214 Second-harmonic generation at interfaces. G.A.Reider, A.J.Schmidt (Abteiling fur Quantenelektronik und Lasertech., Tech. Univ. Wien, Wien, Austria), G.Marowsky.
Opt. Commun. (Netherlands), vol.47, no.3, p.223-5 (1 Sept. 1983).
Second-harmonic light can be generated at dye coated surfaces of fused silica. By changing either the angle of incidence or the frequency of the fundamental, phase matching of signals produced at the two surfaces of a plane parallel plate has been achieved. The interaction of light from multiple internal reflections has also been studied. (5 refs.)

118215 Ultraviolet four-photon mixing in a multimode silica fiber Raman amplifier. R.Pini, R.Salimbeni (Istituto di Elettronica Quantistica, CNR, Florence, Italy), M.Matera, C.Lin.
Opt. Commun. (Netherlands), vol.47, no.3, p.226-9 (1 Sept. 1983).
Efficient frequency conversion of the XeF excimer (351.2 nm) by nonlinear effects in a highly multimode silica fiber is reported. Besides a substantial Raman amplification of the weaker XeF line at 353.3 nm, stimulated four-photon mixing has also been observed, generating a Stokes peak at 355.5 nm with a 1 kW peak power. (6 refs.)

118216 Generation of tunable single-frequency continuous-wave coherent vacuum-ultraviolet radiation. A.Timmermann (Inst. fur Atom- und Festkorperphys., Freie Univ. Berlin, Berlin, Germany), R.Wallenstein.
Opt. Lett. (USA), vol.8, no.10, p.517-19 (Oct. 1983).
Tunable single-frequency continuous-wave coherent VUV radiation is generated at $\lambda_{VUV}=143.6$ nm by resonant frequency tripling in Mg. The frequency of the output of a frequency-stabilized dye ring laser (spectral width $\Delta\nu < 1$ MHz) is tuned to the two-photon transition $3s^2\ {}^1S_0$-$3s3d\ {}^1D_2$ ($\lambda=430.9$ nm) of Mg. A laser power of 0.2 W produces at the third harmonic more than 1.2×10^5 photons/sec (1.8×10^{-13} W). Radiation generated by this method will provide laser VUV spectroscopy of highest spectral resolution. (20 refs.)

118217 Observation of solitons in stimulated Raman scattering. K.Druhl (Inst. for Modern Optics, Univ. of New Mexico, Albuquerque, NM, USA), R.G.Wenzel, J.L.Carlsten.
Phys. Rev. Lett. (USA), vol.51, no.13, p.1171-4 (26 Sept. 1983).
Anomalous pump-depletion reversal in stimulated Raman scattering has been observed and is interpreted as the experimental findings are presented and compared with the analytical solutions to the undamped stimulated Raman scattering equations as well as with a numerical study of the damped equations. (9 refs.)

118218 Competition between stimulated Brillouin scattering and optical breakdown in argon. S.B.Papernyi, V.F.Petrov, V.A.Serebryakov, V.R.Startsev.
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.293-7 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.502-9 (March 1983). [received: Oct. 1983]
Measurements were made of the dependences of the stimulated Brillouin scattering (STBS) threshold and of the gain *g* (cm/MW) on the pressure of argon. The influence of the focusing geometry on the process of competition between STBS and optical breakdown was studied. The influence of breakdown on STBS was described by introducing effective nonlinear losses proportional to the intensity of the pump radiation. Within the framework of this approach a good agreement was obtained between the experimental and theoretical results. (19 refs.)

118219 Second harmonic generation in a YAG laser with self-locking of longitudinal modes. A.A.Gusev, S.V.Kruzhalov, B.V.L'vov, L.N.Pakhomov, V.Yu.Petrun'kin (M.I Kalinin Polytech. Inst., Leningrad, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.322-8 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.547-57 (March 1983). [received: Oct. 1983]
A theory is developed of intracavity second harmonic generation in multimode continuously pumped lasers with a homogeneously broadened gain profile. An analysis is made of the amplitude distribution and phase relationships between the generated modes. A theoretical and experimental study is reported of the spontaneous establishment of frequency modulation of the output radiation of a YAG laser with self-locking of longitudinal oscillation modes and intracavity frequency doubling. The conditions for the occurrence of this effect are

determined. Spectral and time characteristics are given for the fundamental frequency radiation and for the second harmonic emitted by the YAG laser. (5 refs.)

118220 Synthesis of the D_2O laser frequency ($\lambda=84\ \mu$) using a superconducting nonlinear device. N.G.Basov, E.M.Belenov, S.I.Vedeneev, M.A.Gubin, K.N.Glazachev, V.V.Nikitin, V.A.Stepanov (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.339-43 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR),* vol.10, no.3, p.574-9 (March 1983). [received: Oct. 1983]
Experiments are described on multiplying the frequency (7.4×10^{10} Hz) of a klystron and mixing the multiplied frequency with radiation of frequency 3.6×10^{12} Hz from a D_2O laser. The nonlinearity of superconducting point contacts and the experimental method employed made it possible to multiply and mix at frequencies exceeding several times the ultimate frequency, and to investigate the mixing mechanism. The amplitude of the beat signal between the laser radiation and the multiplied klystron frequency was proportional to the differential resistance of the contact. Over a wide range of contact bias voltages, the frequency on the beat signal was independent of the Josephson emission frequency. No substantial difference was discovered between the nonlinear properties of the contacts at frequencies of 10^{10} and 3.6×10^{12} Hz. It was found that superconducting point contacts enabled a considerable simplification to be made in the frequency synthesis chain of an He-Ne laser by excluding several klystrons, metal-oxide-metal diodes, and a bulky submillimeter HCN laser. (8 refs.)

118221 Energy characteristics of stimulated scattering of ultrashort light pulses. G.L.Brekhovskikh, A.I.Sokolovskaya (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR), J.Ferrier, Z.Wu, G.Rivoire.
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.372-4 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR),* vol.10, no.3, p.622-4 (March 1983). [received: Oct. 1983]
An investigation was made of the energy characteristics of stimulated Raman scattering (STRS) and of stimulated scattering in the Rayleigh wing (STSRW) of YAG laser pulses of 25 psec duration in benzene, carbon disulfide, and toluene. It was established that when the active-layer thickness was of the order of the spatial length of the laser pulses, the forward and backward STRS and STSRW processes were in the form of an amplified spontaneous noise of intensity which varied stochastically from one shot to another. The STRS and STSRW threshold were governed by the relaxation times of the molecules in the active medium. When the thickness of the scattering layer was much greater than the spatial length of the laser pulses, the nature of the energy dependence of the forward STRS approached the energy dependence of the STRS excited by pulses of nanosecond duration. (15 refs.)

118222 Efficient conversion of visible radiation from a tunable dye laser to the ultraviolet range. S.M.Kopylov, L.K.Mikhailov, O.B.Cherednichenko.
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.375-6 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR),* vol.10, no.3, p.625-7 (March 1983). [received: Oct. 1983]
An experimental investigation was made of the conversion of the second harmonic of the radiation of a dye laser of wavelengths 545-760 nm into ultraviolet radiation of wavelengths 217-280 nm by the method of sum-frequency generation. The use of a KDP crystal with phase matching by angular adjustment ensured that the conversion efficiency was 35%. (9 refs.)

118223 Generation of tunable infrared radiation by stimulated Raman scattering on hydrogen in a prism-lens optical delay line. R.B.Andreev, V.S.Butylkin, V.A.Evtyushkin, P.S.Fisher, V.V.Khabarov (Inst. of Radio Engng. & Electronics, Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.406-8 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR),* vol.10, no.3, p.662-4 (March 1983). [received: Oct. 1983]
The threshold of stimulated Raman scattering was lowered by filling an optical delay line with hydrogen. Pumping was by a tunable neodymium laser. Lens-prism combinations were used as phase correctors in the delay line. The dependences of the energy of the Stokes component on the pump energy determined experimentally for different numbers of transitions through the delay line were compared with the results of a calculation allowing for the losses in the components of this line. When the frequency conversion was by a factor of at least 2 and the tuning range was wide (tens of percent), the optimal performance was obtained from the optical delay line when total-internal-reflection prisms and lenses were combined in a single component and oriented at the Brewster angle. (4 refs.)

118224 Efficient up-conversion of a CO_2 laser frequency in sodium vapor. N.P.Makarov, A.K.Popov, V.P.Timofeev (L.V. Kirenski Inst. of Phys., Acad. of Sci., Krasnoyarsk, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.408-9 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR),* vol.10, no.3, p.664-5 (March 1983). [received: Oct. 1983]
A quantum efficiency of 65% (corresponding to a power efficiency of 2640%) was achieved in up-conversion of $\lambda=10.8\ \mu$ CO_2 laser radiation by resonant parametric mixing in sodium vapor. (1 ref.)

118225 Possibility of using the method of coherent anti-Stokes scattering under stimulated Brillouin backscattering conditions. A.F.Bunkin, D.V.Vlasov, R.A.Garaev (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.412-13 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR),* vol.10, no.3, p.669-70 (March 1983). [received: Oct. 1983]
An analysis is made of variants of systems which can extend the range of conditions under which the CARS method can be used. An analysis is made of the efficiency of such systems from the point of view of the condition for spatial phase-matching in four-wave interactions. (2 refs.)

118226 Wavefront inversion and the problem of shaping the structure of laser radiation. V.I.Bespalov, G.A.Pasmanik (Inst. of Appl. Phys., Acad. of Sci., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.44, no.8, p.17-26 (1980). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.,* vol.44, no.8, p.1572-84 (1980). [received: Oct. 1983] (2nd All-Union Conference on 'Laser Optics', Leningrad, USSR, Jan. 1980).
Monochromatic radiation of arbitrary structure and polarisation can, in principle, be exactly 'inverted'—sent back along the same path—and exactly duplicate the original ('direct') radiation as it propagates in a nonmoving medium The situation is different if the spatial structure of the radiation varies in time. In this case, the surface of the wavefront is also changed and, consequently, the shape and position of the reflecting surface must be changed. Because of the Doppler effect associated with the latter's motion, the frequency of the inverted radiation will differ from that of the incident radiation and, consequently, inversion will not be exact. For nonstationary radiation the choice of the manner in which the inverting surface moves is, generally speaking, nonunique as well. Only supplementary conditions involving minimization of the various distortions can reduce this ambiguity. The magnitude and nature of the frequency change on inversion may be determined by the type of inverting device used. The authors investigate how the shape of the inverting surface may be determined. (33 refs.)

118227 Phase matching and frequency detuning effects in Brillouin enhanced four-wave mixing. A.M.Scott (Royal Signals & Radar Establ., Malvern, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.276-83 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
The theory of phase conjugation by Brillouin enhanced 4 wave mixing is developed and the effects of phase mismatching and detuning the probe beam from the centre of the Brillouin resonance are investigated. Extremely high reflection coefficients ($R>10^6$) are shown to be possible when one jump beam is much stronger than the second, and when the pump beam intensities, the probe beam frequency and the interaction length all take certain critical values. (5 refs.)

118228 Highly efficient, high-quality phase-conjugate reflection at 308 nm using stimulated Brillouin scattering. E.Armandillo (ENEA-CRE, Rome, Italy), D.Proch.
Opt. Lett. (USA), vol.8, no.10, p.523-5 (Oct. 1983).
The authors report efficient, diffraction-limited phase conjugation of a XeCl laser beam (308 nm) using stimulated Brillouin scattering. Reflectivities approaching 100% are obtained by focusing a XeCl laser ($<0.15\ cm^{-1}$ linewidth) at 300 GW/cm^2 into heptane or ethanol. (7 refs.)

118229 Stochastic theory of emission spectrum from strongly driven system. E.Hanamura (Dept. of Appl. Phys., Univ. of Tokyo, Tokyo, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3265-74 (Sept. 1983).
The effect of frequency modulation on optical phenomena is reduced critically when the Rabi frequency increases beyond the inverse correlation time or the amplitude of the frequency modulation. This is observed in the time region as the change of the free induction decay rate from the Bloch type into the Redfield one. This is shown to be observable also in the frequency region as the narrowing of the central line and the side bands split-off by the Rabi frequency above and below it in the emission spectrum beyond the case when the Rabi frequency is equal to the inverse correlation time.

118230 Oscillatory behaviour of two-photon echo signals. R.Boscaino, F.M.Gelardi, G.Messina (Istituto di Fisica, Palermo, Italy).
Phys. Lett. A (Netherlands), vol.97A, no.9, p.413-16 (26 Sept. 1983).
The two-photon (TP) echo effect has been investigated in a two-level spin system (E'_1 centres in glassy silica) by revealing the second-harmonic wave emitted by the system. Oscillatory signals were observed when either of the input pulses was long compared to the TP-nutational period. (18 refs.)

118231 Self-induced transparency in limited media. G.T.Adamashvili (Tbilisi State Univ., Tbilisi, USSR), S.V.Manakov.
Solid State Commun. (USA), vol.48, no.4, p.381-4 (Oct. 1983).
A theory is constructed of self-induced transparency for a surface wave propagating on the boundary surface of two media, one of which is a resonance one, and also for a localized TE-mode in dielectric waveguide, containing non-intersecting two-level atoms. An evident expression is found for a pulsing solition, formed in these conditions, in terms of initial data. (6 refs.)

118232 Control of laser beams in nonlinear media. Problems of suppressing nonlinear distortions. M.A.Vorontsov, V.P.Kandidov, A.P.Sukhorukov, S.S.Chesnokov (M.V. Lomonosov Moscow State Univ., Moscow, USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.44, no.8, p.55-62 (1980). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.44, no.8, p.1622-30 (1980). [received: Oct. 1983] (2nd All-Union Conference on 'Laser Optics', Leningrad, USSR, Jan. 1980).
Methods for optimization of the propagation of light beams in nonlinear media are discussed. Computer modelling is used to analyze the effectiveness of the algorithm proposed for optimum control of the amplitude-phase profile of the beam to suppress thermal self-action in a moving medium. (17 refs.)

118233 Interaction between light beams in thermocapillary liquid media. G.da Costa, F.Bentolila, E.Ruiz, H.Galan (Dept. de Phys., Univ. Simon-Bolivar, Caracas, Venezuela).
J. Opt. (France), vol.14, no.4, p.179-88 (July-Aug. 1983). In French.
The free surface of a thermocapillary liquid is heated by irradiation with a Gaussian laser beam. The free surface passes by an earlier dilatation stage, followed by the formation of a pit. The surface deformation modulates in turn the phase of the reflected and transmitted beams. This phenomenon belongs to the domain of self-modulation of light beams by interaction with a material medium. The dynamics of formation of a complex depression is studied experimentally and numerically. (12 refs.)

118234 The orientational optical nonlinearity of planarly aligned long-pitch cholesterics. N.F.Pilipetsky, A.V.Sukhov, B.Ya.Zel'dovich (Inst. for Problems in Mech., Moscow, USSR).
Mol. Cryst. & Liq. Cryst. Lett. (GB), vol.92, no.6, p.157-63 (1983).
Optical nonlinearity of self-focusing type is investigated both theoretically and experimentally, which is due to reorientation of the cholesteric director by the light field, the effective nonlinear susceptibility decreasing abruptly with the shortening of the pitch P. (5 refs.)

118235 Breakup of beams with a regular spatial structure in a cubic medium. L.A.Bol'shov, D.V.Vlasov, R.A.Garaev (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.365-8 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.613-16 (March 1983). [received: Oct. 1983]
Experimental and theoretical studies were made of the characteristics of an instability of beams with regular spatial spectra in the presence of small-scale self-focusing. The process differed qualitatively from small-scale self-focusing of a plane wave and the difference was due to the possibility of simultaneous growth of perturbations, of various spatial spectral components in the field of several pump components in the case of spatial phase matching between the interacting waves. The growth increments of the instabilities were calculated for different types of spatial spectra of pump beams. (10 refs.)

42.70 OPTICAL MATERIALS

118236 Optical materials for CO_2 lasers. N.V.Karlov, E.V.Sisakyan (P.N. Lebedev Phys. Inst., Acad. of Sci., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.44, no.8, p.63-8 (1980). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.44, no.8, p.1631-8 (1980). [received: Oct. 1983] (2nd All-Union Conference on 'Laser Optics', Leningrad, USSR, Jan. 1980).
The basic characteristics of certain optical materials for use in CO_2 lasers, e.g. the absorption coefficients at $\lambda=10.6$ microns, continuous-duty optical strength, and pulsed-operation radiative strength, are discussed. (5 refs.)

118237 TeO_x thin films for an optical disc memory. M.Takenaga, N.Yamada, K.Nishiuchi, N.Akahira, T.Ohta, S.Nakamura, T.Yamashita (Central Res. Lab., Matsushita Electrical Industrial Co. Ltd., Osaka, Japan).
J. Appl. Phys. (USA), vol.54, no.9, p.5376-80 (Sept. 1983).
Tellurium suboxide thin films TeO_x were found to change in refractive index and extinction coefficient on thermal or optical heating, with accompanying changes in the reflectivity and transmission. The preparation method and thermal or optical properties of the TeO_x thin films were investigated to obtain a stable and highly sensitive optical disc memory. A two-source evaporation method using Te and TeO_2 provided a uniform and any desired composition. The properties of the film depended on the x value; increasing x to as large as $x=1.2$, which represents a Te-poor composition, produced an excellent humidity and heat stability, and decreasing x to 0.8 made the film more sensitive to a laser diode, but susceptible to humidity. The $TeO_{1.1}$ thin film was found to sufficiently satisfy all requirements for practical disc applications. A reflective optical disc was prepared using the $TeO_{1.1}$ thin film deposited on a polymethylmethacrylate substrate with grooves for optical tracking. This disc is capable of recording video signals at real time by laser diodes. It showed no reflectivity changes on recorded or unrecorded areas and no sensitivity change to laser light after long term storage in high humidity and temperature. (9 refs.)

42.70C Glass

118238 Effect of thermal stress on the homogeneity of optical glasses. Zhao Weng-xing, Wang Da-heng (Changchun Inst. of Optics & Fine Mech., Acad. Sinica, Changchung, China).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.134-9 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
When glass is annealed under stressed conditions, its physical properties such as refractive index, density, etc., are subjected to change as compared with similarly annealed glass under stress free conditions. This phenomenon may be termed 'thermal stress effect'. Various types of optical glasses were studied for this effect by an interferometric method using beam shaped specimens annealed under external bending conditions. In the annealing of a bulk of optical glass, when cooling the glass through the annealing range, thermal stress is generated within the bulk of glass, resulting in an uneven distribution of refractive index due to the thermal stress effect. Experiments were carried out for various types of optical glasses and their corresponding values were evaluated. (6 refs.)

42.72 OPTICAL SOURCES AND STANDARDS

(for spectroscopic light sources, see also 07.65)

118239 Partially polarized planar sources that generate the same intensity distribution at the output plane. R.Martinez-Herrero (Dept. de Optica, Facultad de Ciencias Fisicas, Univ. Complutense, Madrid, Spain), P.M.Mejias.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.570-3 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
For general non-dispersive optical systems, the existence of quasimonochromatic planar sources with different states of partial polarization that generate identical intensity distributions at the output plane of the system has been investigated. By using the procedure outlined by the authors in previously reported works, the common characteristic and the relationship that must be satisfied by the coherence matrix of all these sources have been determined. (12 refs.)

118240 Characteristics of K-Rb lamps as the pump sources for $YAG:Nd^{3+}$ lasers. E.N.Gaidukov, P.I.Gerashchenko, P.G.Konvisar, V.A.Kuznetsov, G.S.Leonov, S.R.Rustamov.
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.368-9 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.616-18 (March 1983). [received: Oct. 1983]
An experimental investigation was made of some characteristics of the operation of Soviet K-Rb pump lamps designed for $YAG:Nd^{3+}$ lasers. It was found that at low pumping rates these K-Rb lamps are efficient pump sources for $YAG:Nd^{3+}$ lasers. (3 refs.)

42.78 OPTICAL LENS AND MIRROR SYSTEMS

(for microscopes, see 07.60P; for photographic instruments, see 07.68; for astronomical telescopes, see 95.55)

118241 Effects of a magnetic field on the optical properties of dielectric mirrors. E.Iacopini, G.Stefanini, E.Zavattini (CERN, Geneva, Switzerland).
Appl. Phys. A (Germany), vol.A32, no.2, p.63-7 (Oct. 1983).
The authors have measured the changes in the polarization state of a monochromatic ($\lambda=514.5$ nm) light beam on reflection at normal incidence by a multilayer dielectric mirror placed in a time-modulated magnetic field. The dominant effect is a Faraday rotation $\Phi\simeq3.7\times10^{-10}$ rad/G. The sensitivity (around 40 Hz) obtained is $\simeq6\times10^{-9}$ rad/$\sqrt{}$Hz, which is dominated by the shot-noise limit (100 mW of light power). (7 refs.)

118242 Simple quasi-zoom with stable pupils. T.H.Jamieson, W.H.Taylor (Kollmorgen Corp., Northampton, MA, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.58-63 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
In conventional zoom systems with the aperture stop located to the rear of the moving components, the entrance pupil position varies greatly during zooming. A simple system of three positive elements, is described which can be used as a dual focal length quasi-zoom lens, which for a rear-positioned aperture stop, has a constant entrance pupil at the zoom extremes. The system may also be employed as a true zoom with limited excursion of the entrance pupil between the zoom extremes. The system is useful as a zoom relay stage in a periscope or where a prism or mirror is located at the entrance pupil to scan the line of sight. (1 ref.)

118243 Compact infrared continuous zoom telescope. M.Roberts, D.R.J.Campbell (Pilkington P.E. Ltd., St. Asaph, Clwyd, Wales).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.64-76 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
In the field of infrared optics (8-12 microns) there is an increasing requirement for continuous zoom telescopes operating with scanner systems. To date, zoom telescopes have for some applications been precluded due to excessive length. An exercise was undertaken to explore the possibility of length reduction. The study resulted in the design of a compact, high performance IR zoom telescope. This design and its development are described including achromatisation, athermalisation and tolerancing aspects. (5 refs.)

118244 Elect-equimultiple imaging with stacked distributed-index planar microlenses. M.Oikawa, K.Iga, M.Morinaga (Res. Lab. of Precision Machinery & Electronics, Tokyo Inst. of Technol., Yokohama, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L386-88 (July 1983).
Four pieces of 2-D arrays of distributed-index planar microlenses (0.8 mmϕ and $f=2$ mm) have been stacked to construct an imaging component. Its working distance was 20 mm and clear images with resolution of more than 20 line pairs/mm have been obtained. (10 refs.)

118245 The Mangin mirror as imaging element. M.J.Riedl (Infrared Industries, Santa Barbara, CA, USA).
Electro-Opt. (USA), vol.15, no.6, p.50-4 (June 1983).
Mangin mirrors conveniently minimize the need for aspherizing reflective elements in infrared detection systems. It is basically a negative meniscus lens

with reflecting second surface. The curvature of the first of the two spherical surfaces is chosen to correct the spherical aberration of the reflector. By this method, the costly manufacturing process of aspherizing a reflective surface can be avoided. Unfortunately, calculating the required radii even for the easiest of all cases—the object at infinity—leads to quite cumbersome mathematical expressions. The particular approximation method uses an iteration process to change the shape of the Mangin mirror in steps until the set limit for acceptable (or desirable) spherical aberration has been met. This technique is based on the typical third-order thin-lens aberration formalism. (3 refs.)

118246 Portable projectors for 16 mm film in 50-year history of the firm Meopta. L.Kuceta.
Jemna Mech. & Opt. (Czechoslovakia), vol.28, no.6, p.166-8 (June 1983). In Czech.
E.D.

118247 Cinematography automation. I.Mateju.
Jemna Mech. & Opt. (Czechoslovakia), vol.28, no.6, p.169-71 (June 1983). In Czech.
Development of automated 35 mm projectors in Czechoslovakia is discussed and the main features of the Meo 5X automatic projector are outlined. (no refs.) *E.D.*

118248 Utilisation of electronics in optical-mechanical instruments. J.Teska.
Jemna Mech. & Opt. (Czechoslovakia), vol.28, no.6, p.172-4 (June 1983). In Czech.
Several examples of innovations of 16 mm projectors, auxiliary equipment of manufacturing apparatus and 35 mm projectors developed by the ZVS-Meopta, Prerov, are discussed which are based on the implementation of electronic circuits. Experiences with the applications of the 8080 microprocessor to a microfiche reader are also discussed. (no refs.) *E.D.*

118249 New generation lens systems for the Wild aviophot aerial camera system. K.Hildebrand (Optical Design Dept., Wild Heerbrugg Ltd., Heerbrugg, Switzerland).
Photogramm. Eng. & Remote Sensing (USA), vol.49, no.8, p.1201-9 (Aug. 1983).
Reports on some of the criteria which have to be met in the further development of aerial-camera lens systems. The quality criteria that were constantly observed in the development work are described in detail, among which integrals on the MTF and their area-weighted average proved particularly useful. Details are given of the metric characteristics and of the image quality of the new lens systems in the visible and near infrared range, and these are compared with the comparable performance data of the older lens types. It is demonstrated that the lens systems of this new generation have a substantially greater information-transmission capacity, a more homogeneous image quality, and lower residual distortion. 42.80 OPTICAL DEVICES, TECHNIQUES AND APPLICATIONS

(for optical instruments and techniques, see 07.60; for optical spectroscopy, see 07.65; for photography, see 07.68; for holography, see 42.40; for lasers, see 42.55 and 42.60; for masers, see 42.52)

118250 Collimator with simulated eye aberrations for use in measuring the modulation transfer function (MTF) of telescopes and binoculars. T.L.Williams, M.L.Nunn (Sira Ltd., Chislehurst, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.78-83 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
A collimator is described which has residual chromatic and spherical aberration similar in magnitude to that of the human eye. The collimator can be used in experimental measurements of the MTF of telescopes and binoculars in order to assess the overall performance of eye plus instrument. The collimator can also be used as the basis for theoretical studies of the effect of eye aberrations on the performance of visual instruments. Examples are given of the effect which the optics of the eye can produce on the MTF of a well corrected telescope. The authors also consider some of the predictions about the visual system which can be made from a study of the through-focus MTF curves of the collimator, such as the magnitude of night myopia. (4 refs.)

118251 Single material achromatic half-wave plate design. N.W.F.Stephens (Spectron Optical Holdings Ltd., Abingdon, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.322-6 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
A simple effective achromatic half wave plate has been designed by computer analysis of birefringent networks based on Poincare sphere representation. By observing some simple rules and applying selection criteria based on rotational properties of half wave plates, some potentially successful plate configurations have been identified. The most promising of these, a three plate combination, has been chosen for manufacture and is now available from the Spectron product range. (4 refs.)

118252 Evolution of map display optical systems. A.Boot (Navigation Systems Dept., Ferranti plc, Edinburgh, Scotland).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.512-20 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Traces the development of Ferranti plc optically projected map displays from the early V Bomber and the ill-fated TSR2 displays to the Harrier and Concorde displays. The author then goes on to the development of combined map and electronic displays (COMED), showing how an earlier design, as fitted to Tornado, has been developed into the current COMED design which is fitted to the F-18 and Jaguar aircraft. In each of the above display systems particular features of optical design interest are identified and their impact on the design as a whole are discussed. The use of prisms both for optical rotation and translation, techniques for the maximisation of luminance, the problems associated with contrast enhancement, particularly with polarising filters in the presence of optically active materials, the use of aerial image combining systems and the impact of the pilot interface on the system parameter are all included. Perhaps the most interesting result in considering the evolution of map displays has not been so much the designer's solutions in overcoming the various design problems but that both the pilot and his environment are themselves an integral part of the system optical design. (no refs.)

118253 Diffracting optics. M.C.Hutley (NPL, Teddington, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.643-6 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Optical elements which direct light by diffraction rather than by reflection have hitherto been very little used because of their chromatic aberration and low efficiency. However, with the more widespread use of lasers there is an increasing number of applications for which chromatic aberration is no longer a problem. With a thick hologram or a blazed surface relief pattern it is possible to achieve useful efficiencies so it now seems reasonable to expect a wider use of diffracting optics. Using holographic techniques it is feasible to produce components of excellent optical quality which are both cheaper and lighter than their conventional counterparts. (3 refs.)

118254 A fast electro-optic focusing device. S.Sullivan (Lincoln Laser, Phoenix, AZ, USA).
Opt. & Laser Technol. (GB), vol.15, no.5, p.249-52 (Oct. 1983).
A dynamic focus method is described which enables the instantaneous focus to be changed dynamically to give an optimum focus for the object illuminated by the laser beam. The dynamic focus method employed uses a three-stage electrooptic focusing device. Each stage of the device consists of an electrooptic cell and a birefringent lens. Performance results are presented for a two state focusing device which demonstrates the feasibility of the system. The switching rate is 158 kHz and the rise-time of the cell is 40 ns. (no refs.)

42.80B Spatial filters, zone plates

118255 Applications of interference coatings in optical processing. G.Molesini, D.Bertani, M.Cetica, F.Quercioli (Istituto Nationale di Ottica, Firenze, Italy).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.130-3 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
The optical transfer function of interference coatings in quasi-monochromatic light appears suitable to directly perform 2-D low-pass, band-pass and high-pass spatial frequency filtering. Uniformity of the coating over an extended area allows for space-invariant operation. Both coherent and incoherent processing are possible. In multiple wavelength frequency bands. This allows for parallel imaging in multiple wavelength with different transfer functions, and can result for pseudocolouring effects if suitable coating such as unblocked interference filters are employed. (13 refs.)

118256 CGH filters for coding and decoding dilute objects. Xie Ching-hui, Cheng Hui-ling, Wu Min-shian, Chin Kuo-fan (Dept. of Precision Instruments, Tsing Hua Univ., Beijing, China).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.510-11 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Describes the formation of an arbitrary blurring followed by the use of a filter in a frequency plane to eliminate the blur. The complex space filters produced by the computer-generated method enables one to construct many new and fascinating coding and decoding systems for dilute objects. Several CGH filters, inverse filters, Wiener filters and the Wiener filter of the exponential type, have been developed. All these filters have been experimentally tested as to their capabilities for cryptology and good results have been obtained. (4 refs.)

118257 Acoustooptical tunable filters. L.N.Magdich (Moscow Inst. of Radioengng. Electronics & Automation, Moscow, USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.44, no.8, p.103-9 (1980). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.44, no.8, p.1683-90 (1980). [received: Oct. 1983] (2nd All-Union Conference on 'Laser Optics', Leningrad, USSR, Jan. 1980).
Outlines the operating principle of the acoustooptical filter (AOF). Relationships are introduced for the tuning curve, apparatus function, and response speed. Various types of AOF are discussed and their parameters are compared. Acoustooptical materials used for AOF are discussed. The directions in which AOF will be improved are predicted and possible fields of application of the filters are listed. (14 refs.)

118258 Synthesised design of optical filters assisted by microcomputer. J.S.Seeley (Dept. of Cybernetics, Univ. of Reading, Reading, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.118-29 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
New algorithms and microcomputer-programs for generating original multilayer designs (and printing a spectral graph) from refractive-index input are presented. The programs are characterised TSHEBYSHEV, HERPIN, MULTILAYER-SPECTRUM and have originated new designs of narrow-stopband, non-polarising edge, and Tshebyshev optical filter. Computation procedure is an exact synthesis (so far as this is possible) numerical refinement not having been needed. (20 refs.)

118259 Tunable bandstop filter for binary objects: a self-imaging technique. J.Ojeda-Castaneda, E.E.Sicre (Phys. Inst., Univ. Erlangen-Nurnberg, Erlangen, Germany).
Opt. Commun. (Netherlands), vol.47, no.3, p.183-6 (1 Sept. 1983).

118261 Multiwavelength operation of an acoustooptic deflector. R.A.Edwards, S.Sullivan (Rediffusion Simulation Ltd., Crawley, England), R.W.Smith.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.655-61 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
An acousto-optic deflector is essentially a diffractive device, and hence the scan generated by the deflector is a function of the optical wavelength used. This has meant that for multiwavelength operation, such as colour laser displays, separate deflectors have been used for each wavelength. The extension of their use, to include more than one wavelength, would clearly have a number of practical advantages. The authors describe a novel holographic method which allows the deflector to be used with more than one wavelength. Also reported is an assessment of the practicality of the method. (no refs.)

42.80F Gratings, echelles

118262 Calibrated grating attenuator. C.Castellini, G.Molesini (Istituto Nazionale di Ottica, Firenze, Italy).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.178-9 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
A calibrated attenuator is demonstrated, operating on a well-known power distribution produced by diffraction. The diffraction object is a Ronchi ruling. Once its physical characteristics are known, the angular power spectrum provides a set of mutually calibrated sources over an extended intensity range. Precise measurements of the grating performance in the visible are referred, and scaling to NIR is demonstrated with generation of a number of calibrated sources. In pulse laser operation the method is proved suitable to obtain a reliable rationing to compute the peak value of the pulses, and to sample fixed attenuations. (no refs.)

118263 New methods for ruling long diffraction gratings. Liang Haoming, Hao De-fu (Changchun Inst. of Optics & Fine Mech., Chinese Acad. of Sci., China).
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.199-208
Diffraction gratings are the indispensable components for various kinds of spectrometers. Due to the limiting conditions imposed by the ordinary ruling machine, long diffraction gratings are very difficult to make. Two methods for ruling long diffraction gratings which overcome these are presented: the 'step-guiding method' and the 'self-guiding method'. The first method makes use of an intermittent interferometer controlled ruling machine, the second method makes use of a continuous photo-electric controlled ruling machine. (2 refs.)

118264 Optical sensor with fibre optic links: a shutter modulator. B.E.Jones, R.C.Spooncer (Dept. of Instrumentation & Analytical Sci., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.376, p.29-36 (1983). (Optical Sensing Techniques, Benefits, Costs, Teddington, Middx., England, 7-8 Dec. 1982).
Describes a simple passive optical displacement sensor which uses the relative movement of a pair of parallel gratings to modulate infrared light coupled between the ends of two optical fibres and has a linear output-displacement relationship. Results are reported for a series of gratings of different pitch. (13 refs.)

118265 Optical tuning of a tellurium cavity—optical modulation and determination of semiconductor parameters. G.Staupendahl, K.Schindler (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).
Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.1, p.159-70 (1983). In English.
A new optical-optical modulator for the infrared region ($4\ \mu m < \lambda < 11 \mu m$) is described. It is based on the tuning of the transmission of a plane parallel tellurium slab by free carriers created by multiphoton absorption of 10.6 μm and 5.3 μm radiation at room temperature. The operation of this device is described by a simple theory using the plane-wave approximation and the Drude-Zehner model. The assumptions of this theory were fulfilled by the experimental conditions, permitting a quantitative analysis of the registered modulations. Under certain working conditions pulse shortening (170 ns pulses of $\lambda = 5.3\ \mu m$ were shortened by up to 20 ns) and fast switch-on of the device (switch-on time $\leq$2ns) were observed. Moreover, the modulator exhibits limiter action and optical bistability, which, for the first time, is observed in an intrinsic semiconductor device at room temperature. (9 refs.)

42.80L Optical waveguides

(for fibre optical waveguides, see 42.80M)

118266 An array of optical stripe wave guides. M.D.Makhdoom (Dept. of Electrical & Electronic Engng., Mehran Univ. of Engng. & Technol., Jamshoro, Pakistan).
Mehran Univ. Res. J. Eng. & Technol. (Pakistan), vol.2, no.1, p.21-5 (Jan. 1983). [received: Sept. 1983]
Discusses the experimental details of an array optical stripe wave guide including the attenuation and resolution of the device. Experimental measurements were made and the results are presented. The viability of the device and possible future work are also discussed. (5 refs.)

118267 Crosstalk characteristics of lens-like Ti-$LiNbO_3$ intersecting channel waveguides. C.T.Lee (Chung Shan Inst. of Sci. & Technol., Lung-Tan, Taiwan).
Electron. Lett. (GB), vol.19, no.20, p.805-6 (29 Sept. 1983).
Crosstalk characteristics of intersecting channel waveguides are presented. Full diffusion times of various Ti film thicknesses are measured first. The concentration distributions in Ti-$LiNbO_3$ crosschannel waveguides are then calculated and compared with the measured distribution. The lens-like medium is the crossover region of crosstalk between Δn and $2\Delta n$ crosschannel waveguide. (6 refs.)

118268 Accurate analysis of the abrupt discontinuity in a dielectric waveguide. T.Takenaka, O.Fukumitsu (Dept. of Computer Sci. & Communication Engng., Kyushu Univ., Fukuoka, Japan).
Electron. Lett. (GB), vol.19, no.20, p.806-8 (29 Sept. 1983).
An accurate analysis of the step discontinuity in a dielectric waveguide is presented. The analysis incorporates the iterative procedure into Lewin's approximate analysis of the laser emission extending Hockam's idea (1974). The numerical solution of the problem converges very quickly. (5 refs.)

118269 Matrix method for determining propagation characteristics of optical waveguides. E.K.Sharma, A.K.Ghatak (Dept. of Phys., Indian Inst. of Technol., Delhi, India), I.C.Goyal.
IEEE J. Quantum Electron. (USA), vol.QE-19, no.8, p.1231-3 (Aug. 1983).
The authors have transformed the scalar wave equation into a matrix eigenvalue equation, the diagonalization of which gives the guided modes and a

discrete representation of the radiation modes. The method is simple and can be used for arbitrary refractive index profiles. (8 refs.)

118270 Propagating beam analysis of multimode waveguide tapers. B.Hermansson, D.Yevick (Inst. of Optical Res., Stockholm, Sweden), P.Danielsen.
IEEE J. Quantum Electron. (USA), vol.QE-19, no.8, p.1246-51 (Aug. 1983).
The authors analyze both slowly and rapidly varying tapers with the aid of the propagating beam method. The authors' results demonstrate that while the optimal longitudinal profile for slowly varying profiles is independent of the taper length, the optimum profile of a taper which varies rapidly with respect to the inverse of the average propagation constant difference of adjacent modes must be determined computationally in each case from the given values of its length and initial and final width parameters. The authors also analyze the region of validity of local normal mode perturbation theory in representation taper configurations. (7 refs.)

118271 Emission of light from a strip waveguide with periodically varying parameters. V.A.Sychugov, A.V.Tishchenko (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.344-8 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR),* vol.10, no.3, p.580-8 (March 1983). [received: Oct. 1983]
A theoretical analysis is made of the problem of the emission of light from a strip waveguide, formed inside a planar waveguide, into the latter waveguide and into the media surrounding it. A calculation is made of the spectral and angular characteristics of the process of emission of light into the planar waveguide. Estimates are obtained of the fraction of the power of light emitted into the planar waveguide. It is shown that a corrugated strip waveguide may be used in integrated-optics devices for demultiplexing of wavelength-division multiplexed optical communication channels. (6 refs.)

118272 Theoretical investigation on the applicability of the ATR-technique to thin-films measurements by guided waves. L.Leine (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).
Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.1, p.99-106 (1983). In English.
The ATR-technique has been investigated using guided waves to determine thin film parameters. The gaussian beam and the plane wave model have been compared by computation angular dependent ATR-spectra. Main attention has been given to the effect of laser beam width, air-gap width and the mode order of guided waves on the spectra. The waveguiding film parameters have been determined by fitting a computer program for the gaussian beam and plane wave model respectively. All computations have demonstrated that the plane wave model is unsuitable to determine thin film parameters from ATR-measurements, because the attained error is too large. It has been shown that the one-dimensional gaussian beam is a good approximation for calculations. (14 refs.)

118273 Ion-implanted waveguides. H.Karge, H.Just, R.Prager (Sektion Phys., Friedrich-Schiller-Univ. Jena, Jena, Germany).
Wiss. Z. Friedrich-Schiller-Univ. Jena, Math. Naturwiss. Reihe (Germany), vol.32, no.1, p.147-58 (1983). In German.
Ion implantation into several optical materials changes the refractive index in near surface regions by radiation damage and incorporation of the implanted ions. The different applications of this effect for production of waveguide structures are discussed. The possibilities of the method are shown for the case of ion implanted waveguides in LiNbO$_3$, quartz and fused silica. (31 refs.)

118274 Single-mode W-fibres with profile-threshold for low dispersion over a wide spectral range. A.Majewski, H.G.Unger (Tech. Univ. Braunschweig, Braunschweig, Germany).
Arch. Elektron. & Uebertragungstech. (Germany), vol.37, no.9-10, p.336-8 (Sept.-Oct. 1983).
Single-mode W-fibres with a threshold layer of raised index surrounding their inner cladding are designed to have zeroes of dispersion coefficient at three different wavelengths, and as a consequence typically less than 1 ps/(nm km) dispersion over a wavelength range of nearly 0.4 μm. (11 refs.)

118275 Fiberoptic communications. Status and prospects for development. E.M.Dianov (P.N. Lebedev Phys. Inst., Acad. of Sci., USSR).
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.44, no.8, p.160-72 (1980). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.,* vol.44, no.8, p.1754-69 (1980). [received: Oct. 1983] (2nd All-Union Conference on 'Laser Optics', Leningrad, USSR, Jan. 1980). (40 refs.)

118276 Fiber optics: new technology or an old idea?.
Wire J. Int. (USA), vol.16, no.8, p.33-4 (Aug. 1983).
Fiber optics technology has progressed at a rapid pace in recent years. Currently (1983), technologists in the United States and abroad are working on a wide variety of programs which, among other things, are aimed at developing: optical transmitters, receivers and fibers for carrying light signals in longer wavelengths that will make possible longer transmission links without installing regenerators along the way; wavelength division multiplexing; new integrated circuits containing on a single chip all the devices needed for transmitting, regenerating and receiving optical signals; optical switching systems that will process telephone calls in the form of light pulses rather than as the traditional electrical signals; single-mode optical fibers that will carry just one ray of light and thus offer a broader highway for handling many more phone calls. (no refs.)

118277 Single mode laser spectral spread repercussion in single-mode optical fiber coherent detection systems. P.Gallion, F.J.Mendieta, C.Chabran (Dept. Electronique et Phys., Ecole Nat. Superieure des Telecommunications, Paris, France).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.527-31 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Single frequency laser source phase noise constitutes a limitation in single-mode optical fiber coherent detection systems such as heterodyne communication receivers and optical fiber interferometric sensors. The authors investigate the phase noise affecting the beat photocurrent produced by the coherent detection of a single frequency laser field with a time-delayed and frequency-shifted image of itself in a heterodyne interferometer. The photocurrent spectrum is discussed as a function of the source lineshape and interferometer decorrelation time. An experimental study is reported consisting of a single-mode fiber Mach-Zender interferometer employing a single-frequency laser and an acousto-optical modulation for frequency-shifting one of the interferometer arms. Results are in good agreement with theory. (8 refs.)

118278 Optical fibre sensors for displacement measurement. M.C.Hutley (Div. of Mech. & Optical Metrology, NPL, Teddington, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.376, p.37-41 (1983). (Optical Sensing Techniques, Benefits, Costs, Teddington, Middx., England, 7-8 Dec. 1982).
The author believes that a rational and economical development of optical fibre sensors can best be achieved by a universal measuring system which can readily be adapted to measure a range of parameters. It appears that the measurement of displacement is most likely to fulfil this need and the author has considered two systems by which this can be achieved. In particular, a wavelength encoded sensor system appears to have much to offer. The author has assembled for demonstration purposes an example of such a system measuring pressure, displacement, mass and level. His purpose in producing this has been to illustrate one form that such a system might take and to invite from potential users and manufacturers comments which will help the rapid development of a fully operational system. This particular system has several advantages but it is not susceptible to wavelength division multiplexing and is rather wasteful of light. However, it does have the advantage that it can be put into operation using existing technology so that even if it is not the eventual choice for a universal sensing system, it may nevertheless play a useful role in defining the form that system will have. (5 refs.)

118279 The promise of the future [low-loss optical fibres]. A.R.Tebo.
Electro-Opt. (USA), vol.15, no.6, p.41-6 (June 1983).
The development of heavy-metal-fluoride glasses for mid-infrared optical fibers for telecommunications is following the path of slow progress traversed by silica fibers, but the prospects for ultralow-loss fibers make it all worthwhile. (26 refs.)

118280 Fabrication of polarisation-maintaining [3×3] single-mode-fibre couplers. M.Kawachi (Ibaraki Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Ibaraki, Japan).
Electron. Lett. (GB), vol.19, no.19, p.781-2 (15 Sept. 1983).
[3×3] fused fibre couplers have been fabricated with polarisation-maintaining and absorption-reducing (PANDA) fibres. The couplers can hold linear polarisation along the principal axis of the fibre branches, showing an extinction ratio better than −15 dB. (7 refs.)

118281 8 km-long polarisation-maintaining fibre with highly stable polarisation state. Y.Sasaki, T.Hosaka, K.Takada, J.Noda (Ibaraki Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Ibaraki, Japan).
Electron. Lett. (GB), vol.19, no.19, p.792-4 (15 Sept. 1983).
A new preform fabrication technique for realising long lengths of polarisation-maintaining optical fibres is described. The technique is shown to produce stress-induced birefringent fibres with symmetry and uniformity along the length in the stress-applying parts. The resultant 8.3 km-long fibre whose relative refractive-index difference is 0.6% has been obtained with a crosstalk of −23 dB at 1.15 μm wavelength, where the loss is 1.7 dB/km. (8 refs.)

118282 Acousto-optic frequency shifter for single-mode fibres. K.Nosu, S.C.Rashleigh, H.F.Taylor, J.F.Weller (Naval Res. Lab., Washington, DC, USA).
Electron. Lett. (GB), vol.19, no.20, p.816-18 (29 Sept. 1983).
A fibre-optic frequency shifter has been constructed using a birefringent single-mode fibre positioned asymmetrically within two acoustic resonators driven 90° out of phase. The incident wave in one polarisation state is coupled to a frequency-shifted wave in the orthogonal state. Sideband suppression of better than 20 dB is achieved. (6 refs.)

118283 Polarisation-preserving coupler with self aligning birefringent fibres. W.Pleibel, R.H.Stolen (Bell Labs., Holmdel, NJ, USA), S.C.Rashleigh.
Electron. Lett. (GB), vol.19, no.20, p.825-6 (29 Sept. 1983).
Polarisation-preserving directional couplers have been fabricated with birefringent fibres that self align their axes within the coupling region. The polarisation characteristics have been measured with the reliable spectral-averaging technique, and broadband extinction ratios of −20 dB have been achieved, on average, in all ports. (12 refs.)

118284 γ-ray irradiation effect on transmission loss for ZrF$_4$-based optical fibres. Y.Ohishi, S.Mitachi, S.Takahashi, T.Miyashita (Nippon Telegraph & Telephone Public Corp., Ibaraki, Japan).
Electron. Lett. (GB), vol.19, no.20, p.830-1 (29 Sept. 1983).
The γ-ray irradiation effect on the transmission loss of ZrF_4-BaF_2-GdF_3-AlF_3 and ZrF_4-BaF_2-GdF_3-AlF_3-PbF_2 optical fibres is investigated. Absorption bands are induced in the ultraviolet to near infrared region, and their tails increase the transmission losses in the mid-infrared region. Induced transmission losses for a dose of 10^6 R are 1000-2300 dB/km in the 2-4 μm band. These values are comparable to those at 1.5 μm for doped silica fibres. (6 refs.)

118285 Birefringence and polarization mode dispersion caused by thermal stress in single mode fibers with various core ellipticities. N.Shibata (Ibaraki Electrical Communication Lab., NTT, Ibaraki-ken, Japan), M.Tateda, S.Seikai, N.Uchida.
IEEE J. Quantum Electron. (USA), vol.QE-19, no.8, p.1223-7 (Aug. 1983).
Modal birefringence and polarization mode dispersion in single-mode fibers with various core ellipticities were measured at wavelengths in the 0.633-1.5 μm region. From the measurements and numerical calculations of the birefringence and the modal dispersion due to a geometrical anisotorpy by the point-matching principle, normalized frequency dependence of the birefringence and the dispersion caused by a thermal stress were clearly obtained for various core ellipticities. Comparing the evaluated results with the calculation within the first-order perturbation theory, it is found that the evaluated curves for core ellipticity of 20 percent are coincident fairly well with that of

theory, while the curves for core ellipticity of 58 percent are shifted markedly toward higher v value region. (14 refs.)

118286 Connector for optical fiber light conductor. C.E.Hayward (IBM Corp., Armonk, NY, USA).
IBM Tech. Disclosure Bull. (USA), vol.26, no.3B, p.1603 (Aug. 1983).
An optical fiber light conductor is attached to a fusion splicing connector that makes a screw connection to a connector that is attached to another light conductor or to a light sending or receiving apparatus. (no refs.)

118287 Evaluation of the fatigue constant n in optical fibers with surface particle damage. F.A.Donaghy, D.R.Nicol (AWA Res. Lab., Amalgamated Wireless (Australia), NorthRyde.Ltd.,NSW, Australia).
J. Am. Ceram. Soc. (USA), vol.66, no.8, p.601-4 (Aug. 1983).
A method of controllably damaging the surface of silica-based optical fibers is described, producing in short lengths the tensile strength typical of long proof-tested lengths. The stress corrosion constant n is obtained relatively rapidly, by correlating the results of static and dynamic fatigue measurements. For damaged 125-μm-diameter fibers, with an average strength of 1.25 GPa, a value for $n=20$ was found, similar to that in pristine fibers. (18 refs.)

118288 Fibre optic transmission—the long-term solution. L.Critchley.
New Electron. (GB), vol.16, no.16, p.55 (16 Aug. 1983).
Compared with conventional wiring in electronic systems, fibre optics necessitates additional components and a more expensive link. However, this apparent disadvantage can be immediately outweighed by the inherent advantages of a fibre optic cable. The author discusses the three types of fibre. (no refs.)

118289 Fiber-optic gyroscope with polarization-holding fiber. W.K.Burns, R.P.Moeller, C.A.Villarruel, M.Abebe (Naval Res. Lab., Washington, DC, USA).
Opt. Lett. (USA), vol.8, no.10, p.540-2 (Oct. 1983).
A fiber gyroscope is reported that uses polarization-holding fiber in the coil, the phase modulator, and the coupler. The random-drift coefficient, calculated from RMS noise levels, was 8.10^{-4} deg/$\sqrt{}$h, within a factor of 2 of an experimentally determined quantum and thermal limit. White-noise behavior was observed for integration time constants from 1 to 40 sec. Device characteristics and performance are presented. (13 refs.)

118290 Monomode-polarization-maintaining fiber directional couplers. B.K.Nayar, D.R.Smith (British Telecom Res. Labs., Ipswich, England).
Opt. Lett. (USA), vol.8, no.10, p.543-5 (Oct. 1983).
The fabrication and experimental evaluation of monomode-fiber directional couplers having polarization-maintaining elliptical-cored fibers is described. The couplers have a polarization isolation of greater than 40 dB and insertion losses of less than 0.5 dB. (8 refs.)

118291 Measurement of polarization mode coupling along a polarization-maintaining optical fiber using a backscattering technique. M.Nakazawa, M.Tokuda, Y.Negishi (Ibaraki Electrical Communication Lab., NTT, Ibaraki, Japan).
Opt. Lett. (USA), vol.8, no.10, p.546-8 (Oct. 1983).
A new technique for measuring the polarization mode coupling of a polarization-maintaining optical fiber has been proposed that uses a modified optical time-domain reflectometry in which two kinds of backscattered signals coming through each principal axis of the fiber are utilized. This technique shows how the mode coupling occurs along the fiber. The extinction ratio evaluated by the present technique is in good agreement with that obtained by a conventional technique (with ±0.5 dB). (11 refs.)

118292 From fibre optics to an actual system. J.L.Tondi Resta, J.A.Carmona, R.A.Ares.
Rev. Telegr. Electron. (Argentina), vol.71, no.840, p.404-7 (May 1983). In Spanish.
The authors mention those characteristics of optical fibres which must be known in order to design a system. They describe an optical fibre with its core and cladding and mention that it may have one or several transmission modes. Despite difficulties in manufacture, single mode fibres are ideal for operation in the second and third low attenuation windows. After discussing the advantages and disadvantages of multimode fibres, the authors discuss the stationary distribution of the modes, deal with the measurement of attenuation including a destructive method and a non-destructive method. Finally the authors describe various experimental methods used to determine the stationary distribution of the modes and evaluate the results obtained. (4 refs.)
G.W.

118293 Radiation-optical properties of quartz glass fiber-optic waveguides (review). E.M.Dianov, L.S.Kornienko, E.P.Nikitin, A.O.Rybaltovskii, V.B.Sulimov, P.V.Chernov (P.N. Lebedev Phys. Inst., Acad. of Sci, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.274-89 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.473-96 (March 1983). [received: Oct. 1983]
A review is given of the radiation-optical properties of glass fiber-optic waveguides. Particular attention is paid to an analysis of radiation-induced absorption in multimode fiber-optic waveguides having pure and doped quartz glass cores. Dependences of the induced absorption on the dose, power, and type of radiation, on the temperature, the concentration of dopants and hydroxyl groups in the core, and on the wavelength and power of the probe radiation are discussed. An analysis is made of the kinetic curves of the changes in the induced absorption both during and after exposure to the radiation. Some models describing the effects of radiation bleaching and optical bleaching are analyzed. The propagation of a bleaching pulse through a radiation-darkened waveguide is examined. (66 refs.)

118294 Dependences of the polarization properties of polymer graded-index fibers of the Selfoc type. N.G.Gachechiladze, S.I.Grigor'ev, M.G.Zguladze, A.N.Mestvirishvili, V.R.Sagaradze (Inst. of Cybernetics, Acad. of Sci., Tbilisi, Georgian SSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.377-8 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.627-9 (March 1983). [received: Oct. 1983]
Temperature dependences of some polarization characteristics were determined for polymer Selfoc-type fibers. It was found that when plane-polarized light passed through a fiber of this kind, it emerged with elliptic polarization. The effective direction of the polarization of light emerging from a fiber was shifted by an angle $\Delta\phi$ from the plane of polarization of the incident wave. The temperature dependence of $\Delta\phi$ was studied. It was found that the investigated graded-index fibers were optically biaxial. (8 refs.)

118295 Optical fiber coupling of 1.2-1.6 μ radiation emitted from buried mesastripe injection lasers. V.P.Duraev, P.G.Eliseev, S.S.Kurlenkov, I.A.Skopin (P.N. Lebedev Phys. Inst., Acad. of Sci., USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.382-4 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.633-5 (March 1983). [received: Oct. 1983]
An investigation was made of the efficiency of coupling—into fiber waveguides—of 1.2-1.6 μ radiation emitted by a buried mesastripe InGaPAs-InP heterojunction laser. The maximum power of the radiation coupled into a fiber waveguide was 16 mW in the CW regime at room temperature. The coupling efficiency was 90% in the case of a multimode fiber waveguide and 36% in the case of a single-mode waveguide when matching was provided by a microlens with a radius of $\sim 10\ \mu$. (8 refs.)

118296 Development of optical fibres by the VAD method. T.Kojima, F.Nakane, K.Muta, K.Adachi, O.Shinji.
Showa Wire & Cable Rev. (Japan), vol.33, no.1, p.39-43 (1983). In Japanese.
The VAD (Vapor-phase Axial Deposition) method is becoming widely used to manufacture optical fibers because of its excellence in mass production and applicability to any needs. In practical use, it is most important to examine reliability. This paper gives a survey of the VAD method, and the transmission properties and reliability of the VAD fibers. This investigation proves that optical fibers manufactured by the VAD method have as long term reliability in transmission properties and mechanical strength as those by the CVD (Chemical Vapor Deposition) method. (4 refs.)

118297 Effects of tension on the refractive-index distribution and the transmission characteristics of a coated optical fiber. Y.Satomura (Faculty of Engng., Osaka Electro-Communication Univ., Neyagawa, Japan), E.Mimura, N.Kumagai.
Trans. Inst. Electron. & Commun. Eng. Jpn. Part C (Japan), vol.J66C, no.7, p.537-8 (July 1983). In Japanese.
The effects of the axial tension on the refractive index distribution and the transmission characteristics of a coated step-index optical fiber are investigated theoretically. The stress- and the index-distributions are derived respectively from an elastic theory and a photoelastic effect and some numerical examples are also presented. (3 refs.)

118298 Fibre optics for feeder applications. R.Subramanian, J.Weiss.
Telephony (USA), vol.205, no.8, p.36, 40, 44, 46 (15 Aug. 1983).
The application of fiber optic technology in the access network so far has been considered only as a future practicality. This article presents the strategic components underlying the choice between digital copper and fiber feeders. The major issues addressed include system architecture and design, performance objectives, implementation, economic analysis, operations and maintenance, and qualitative assessment of voice-data services and wideband services requirements. (no refs.)

118299 Working with glass takes a lighter touch [fibre optic cables]. J.L.Vallosio (General Telephone Co. of Pennsylvania, York, PA, USA).
Telephony (USA), vol.205, no.10, p.28-30 (29 Aug. 1983).
Discusses ways of adapting traditional telephone construction techniques to fibre optic cable. The installation of an eight-fibre optical trunk cable by General Tel of Pennsylvania is described. This project required the placing of fibre optic cable in both underground and aerial locations. A major problem was adapting specialized splicing techniques, but this was solved by using the Elastomeric Splice manufactured by GTE Electronic Components Div. of GTE Precision Materials. (no refs.)

118300 Semiautomatic applications of low cost fiber optic connectors. J.A.Leidy (Signal Components Div., AMP Inc., Harrisburg, PA, USA).
Electro/82 Conference Record, Boston, MA, USA, 25-27 May 1982 (El Segundo, CA, USA: Electron. Conventions 1982), p.27-5/1-5
The OPTIMATE DNP connector system and its semiautomatic application equipment in combination with low cost devices and fiber provides the first major advance in cost effective optics for the consumer durables, industrial, and data systems market. This connector system has been designed to operate with 1000 micron plastic optical fiber. The various device mounts interface both TO 92 style packages and modified TO 18 style packages. The system is based on a single or dual plug which uses a primary alignment mechanism consisting of two opposing V-grooves for centering the fiber to ensure less than 3 dB insertion loss when end finish is achieved with a hot cut-off blade. The plug is then centered into the receptacle by taking advantage of four protrusions which accurately locate the plug into the receptacle. (no refs.)

118301 Performance of active and passive night viewing systems under low ambient illumination levels. J.C.Monga, B.D.Bhawe (Bhabha Atomic Res. Centre, Bombay, India).
Opt. & Laser Technol. (GB), vol.15, no.5, p.259-62 (Oct. 1983).
A comparison of the estimated field performance of some typical active and passive night viewing systems under low illumination levels is presented. In addition to the 'range', a generalized figure of merit, the minimum detectable object size (MIDOS), is suggested and used as a basis of comparison. The influence of the optics and other parameters is discussed and the usefulness of the results in the optimization of system design is illustrated. The results indicate that active systems perform better than similar passive systems under certain commonly encountered ambient conditions. (9 refs.)

118302 Total-reflection wavelength demultiplexer using a highly dispersive medium. M.Tateda, F.Kanaya (Musashino Electrical Communication Lab., NTT, Tokyo, Japan).
Opt. Lett. (USA), vol.8, no.10, p.531-3 (Oct. 1983).
The authors propose a new type of optical wavelength demultiplexer that employs the wavelength dependence of reflectivity at the interface plane for two media having different dispersive characteristics. This device utilizes a total-reflection phenomenon and guarantees a perfectly zero cross talk or less than 4×10^{-4} cross talk, respectively, at any wavelength shorter or longer than the design-window-wavelength region. (for optical waveguides see also 42.80L)

118303 Integrated-optics elements and systems. V.N.Morozov, V.A.Pletnev, Yu.M.Popov, V.L.Smirnov.
Bull. Acad. Sci. USSR, Phys. Ser. (USA), vol.44, no.8, p.78-92 (1980). Translation of: *Izv. Akad. Nauk SSSR Ser. Fiz.*, vol.44, no.8, p.1651-69 (1980). [received: Oct. 1983] (2nd All-Union Conference on 'Laser Optics', Leningrad, USSR, Jan. 1980).
Research in the field of integrated optics is reviewed. The basic methods used to build waveguides and use them in diffraction-grating structures, planar lenses, polarizers, directional couplers, modulators, deflectors, and other waveguide elements for optical communications lines and data-processing devices are described. (125 refs.)

118304 Chirped grating lenses in Ti-indiffused $LiNbO_3$ optical waveguides. W.S.C.Chang, S.Forouhar, J.M.Delavaux, C.Warren, Ron-Xin Lu (Dept. of Electrical Engng. & Computer Sci., Univ. of California, La Jolla, CA, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.581-90 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Chirped grating lenses have been successfully designed, fabricated and evaluated for the first time on Ti-indiffused $LiNbO_3$ waveguides. The design procedure, the expected and measured performances, the materials and fabrication processes developed, and the performance limitations imposed by the waveguide parameter and by the fabrication tolerances are presented. (5 refs.)

118305 Integrated optical microwave spectrum analyser (IOSA) using geodesic lenses. G.F.Doughty, R.M.DeLaRue, N.Finlayson, J.Singh, J.F.Smith (Electronics & Electrical Engng. Dept., Univ. of Glasgow, Glasgow, Scotland).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.705-10 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
The authors report on an IOSA based on a titanium diffused optical waveguide layer in lithium niobate with geodesic lenses. Lenses were designed by the method of Sottini et al. but with essential modifications to smooth over regions of extreme curvature. Ray-tracing analysis showed that the deviation from the ideal profile introduced by this smoothing had negligible effect. Several lens fabrication methods were experimentally evaluated—ultrasonic impact grinding, computer-controlled diamond tool grinding and diamond turning, followed by polishing with large area flexible tools, or with small pads under microprocessor time and position control. The most reliable method was diamond turning followed by polishing with a small pad on a specially constructed computer controlled polishing machine. Data are also presented on factors affecting overall spectrum analyser dynamic range such as inplane scattering and acousto-optic third-order intermodulation. (12 refs.)

118306 Micro-optical 3-dB mode converters. P.S.Chung (School of Electrical Engng. & Computer Sci., Univ. of New South Wales, Kensington, NSW, Australia).
Opt. & Laser Technol. (GB), vol.15, no.5, p.263-8 (Oct. 1983).
Presents a detailed design of a 3-dB TE_0-TE_1 micro-optical mode converter using a chirped grating to phase-match the two propagation modes in an optical waveguide. Devices were fabricated in titanium in-diffused lithium niobate by ion-beam etching the tapered grating pattern into the waveguide surface. The power transfer between the two coupled modes was observed experimentally by varying the angle between the light beam and the normal grating wave-vector. Insertion loss of the TE_0-TE_1 mode converter due to spurious scattering was estimated at 1.5 dB. (15 refs.)

118307 Electro-optic branching-waveguide switch with low drive voltage. M.Haruna, T.Hibi, J.Koyama (Dept. of Electronics, Faculty of Engng., Osaka Univ., Osaka, Japan).
Opt. Lett. (USA), vol.8, no.10, p.534-6 (Oct. 1983).
Both experimental and theoretical results of a low-voltage-driven optical branching-waveguide switch in Z-cut $LiNiO_3$ are presented. In a 10-μm-wide single-mode branching-waveguide switch for $\lambda_0=0.6328$ μm, the 10-dB extinction ratio was obtained at a drive voltage as low as ±6.5 V, although ±40 V was required in a 4-μm-wide switch. The scattering loss of the guided mode at the branching point was evaluated to be 1.3 dB. (12 refs.)

42.85 OPTICAL TESTING AND WORKSHOP TECHNIQUES

118308 Diamond machining. The impact on rotating scanners. W.Caithness, J.Eisenberger, A.W.Naugler.
Photonics Spectra (USA), vol.17, no.8, p.65-6, 68 (Aug. 1983).
Diamond machining has had a major impact on the cost of rotating mirror scanners by taking the highly trained optician out of the production loop. In addition, the new technology makes much of the expensive ancillary equipment needed for the old process obsolete. All of this comes not at the price of reduced quality but with the added benefit of new capabilities. With diamond machining, scanner manufacturers can vary face-to-axis pyramidal angles and produce a large production run of identical parts at a tremendous cost saving. (no refs.)

118309 Self-guiding method for ruling diffraction gratings. Liang Hao-ming, Hao De-fu (Changchun Inst. of Optics & Fine Mech., Chinese Acad. of Sci., Changchun, China).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.666-72 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
Presents a new approach to rule a long diffusion grating, in which a short ruled portion of the ruling grating blank is used as a new dividing element of the engine to continue its ruling. The main ruling errors are analysed and some formulae for the calculation of these errors are derived. The actual resolution of a specimen is 90% of its theoretical value. The tentative results have verified the correctness of the principle links to this method. (1 ref.)

118310 Ion beam etching in InP. I. Ar ion beam etching and fabrication of grating for integrated optics. Y.Yuba, K.Gamo, H.Toba, X.G.He, S.Namba (Faculty of Engng. Sci., Osaka Univ., Osaka, Japan).
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.7, p.1206-10 (July 1983).
The Ar ion beam etching (IBE) of InP has been studied in order to clarify its applicability as a microfabrication technique for devices with submicron geometry such as integrated optics devices. The IBE rate has been determined as a function of ion energy, current density and angle of beam incidence. The crystalline quality of the etched surface has been investigated by electron beam diffraction, Rutherford backscattering and photoluminescence measurements. The etched surface has a polycrystalline phase and recovers to a single crystal after annealing at 500°C. Grating structures with a period of around 2600 A have been fabricated on an InP surface by the Ar-IBE combined with a holographic-photoresist-exposure technique. (15 refs.)

118311 Design solution of the intensification of the production of optical elements. S.Minar.
Jemna Mech. & Opt. (Czechoslovakia), vol.28, no.6, p.161-5 (June 1983). In Czech.
The author discusses special problems encountered in optical materials processing and considers possibilities of improving the effectiveness of optical workshop techniques. In particular, the use of diamond tools and the trend towards automation of the optical workshop techniques are discussed. (28 refs.) *E.D.*

118312 Embossing technique for fabricating integrated optical components in hard inorganic waveguiding materials. W.Lukosz, K.Tiefenthaler (Swiss Federal Inst. of Technol., ETH, Zurich, Switzerland).
Opt. Lett. (USA), vol.8, no.10, p.537-9 (Oct. 1983).
The authors describe a novel embossing technique for fabricating integrated optical components in hard and resistant inorganic waveguiding materials of good optical quality. The desired structure is embossed into a dip-coated deformable gel film prepared from organometallic solutions. Subsequent heat treatment transforms it into inorganic hard oxide material. They have successfully fabricated surface-relief gratings with 1200 lines/mm on SiO_2-TiO_2 waveguides (with refractive index $n_F \simeq 1.8$, thickness $d_F \simeq 120$ nm, and loss <1 dB/cm). The embossed gratings served as input and output grating couplers and as Bragg reflectors. The authors propose to fabricate other integrated optical components for example, channel waveguides, with this method. (3 refs.)

118313 Coherent-optical control of the quality and shape of reflecting objects. V.G.Volostnikov, V.A.Katulin, V.V.Kotlyar, A.N.Malov (P.N. Lebedev Phys. Inst., Acad. of Sci., Kuibyshev, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.396-8 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.649-52 (March 1983). [received: Oct. 1983]
A description is given of a relatively simple method for determining imperfections of the shape and microdefects on the reflecting surfaces of solids of revolution (balls and rollers). It is shown that the method is characterized by an interference sensitivity to surface geometry defects and by a relatively high immunity to errors. (5 refs.)

118314 The theory and apparatus of laser interferometric centring. Yu Zhongru, Yuan Junyi (Optical Instruments Dept., Zhejiang Univ., Zhejiang, China).
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.209-18
Describes a high precision lens-centring system used to assemble some high-precision photolithographic lenses on the basis of a height-difference laser interferometry. The structure of the interferometric lens-centring system, its theory, the necessary equations and diagrams, and the breadboard setting are given. The centring accuracy for lenses with radii ranging from 12 mm to 432 mm is 1″/1 μm which is almost one order higher than the classical optical centring method. (18 refs.)

118315 Acoustic model of the sea floor. Calculation of the complex coefficient of reflection, $\tilde{R}(\omega)$, for a semiinfinite medium with a density gradient. R.Carbo Fite, M.Camarasa Rius, C.Ranz Guerra (UEI de Hideroacustica, Inst. de Acustica, Madrid, Spain), A.M.Soler Navarro.
An. Fis. Ser. B (Spain), vol.79, no.2, p.108-14 (May-Aug. 1983). In Spanish. [received: Oct. 1983]
Presents the theoretical study of sound wave propagation in an inhomogeneous medium with density gradient. The results were applied to obtain the reflection coefficient of the dioptric formed by a semiinfinite homogeneous medium (water) and a semiinfinite inhomogeneous medium with density gradient, and finally the reflection coefficient of a inhomogeneous layer of a given thickness and density gradient, sandwiched between two homogeneous and semiinfinite media (water and hard basement). It was concluded that the reflection coefficient of the layer varies with frequencies in a nontypical way at low frquencies while at high frequencies shows a periodic variation. (7 refs.)

118316 Resonance scattering of acoustic waves by a fluid spheroid. M.I.Dzyubachik.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.7, p.35-8 (1983). In Ukrainian.
Each normal wave is shown to contain a series of resonance terms at frequencies obtained from dispersion equations. Analytical expressions are obtained for resonance parameters. (8 refs.)

118317 Higher order mode acoustic transmission through the walls of rectangular ducts. A.Cummings (Dept. of Mech. & Aerospace Engng., Univ. of Missoui, Rolla, MO, USA).
J. Sound & Vib. (GB), vol.90, no.2, p.193-209 (22 Sept. 1983).
As an extension of previous work on low frequency fundamental mode acoustic transmission through the walls of rectangular ducts, results are presented on the transmission of internally propagated higher order acoustic modes through the duct walls. Subject to various assumptions, it is possible to obtain a closed form solution to the structural wave equation governing the motion of the duct's walls, and this is used to predict the response of the walls to the internal pressure field. The resultant acoustic radiation is estimated here by assuming that the duct radiates like a circular cylinder with the same surface velocity distribution. Both experimental and theoretical results are given and agreement between the two is tolerably good. (16 refs.)

118318 Approximate asymptotic solutions for acoustic transmission through the walls of rectangular ducts. A.Cummings (Dept. of Mech. & Aerospace Engng., Univ. of Missouri, Rolla, MO, USA).
J. Sound & Vib. (GB), vol.90, no.2, p.14-27 (22 Sept. 1983).
Approximate expressions—valid at sufficiently high frequencies—are obtained for the acoustic transmission loss of the walls of rectangular ducts. Single mode propagation inside the duct, both in the fundamental mode and in higher order modes, is considered and a multimode model is also proposed. These theories lead to very simple formulae for the transmission loss, which prove to be in tolerably good agreement with measurements. (12 refs.)

118319 Sound radiation from finite length axisymmetric ducts. W.L.Meyer, B.T.Zinn (Georgia Inst. of Technol., Atlanta, GA, USA).
J. Sound & Vib. (GB), vol.90, no.2, p.286-90 (22 Sept. 1983).
The approach used in this study to analyze the duct radiation problem is based upon the numerical solution of a special cylindrically symmetric integral representation of the external solutions of the Helmholtz equation. Since in this method one considers the combination of the interior and exterior sound fields to be a single entity, the acoustic quantities anywhere outside of the radiating body may be calculated. By employing this method not only can the radiated sound field be determined but the distribution of the acoustic quantities at the duct exit plane may be determined as well. The acoustic admittance (the ratio of the normal component of the acoustic velocity to the acoustic pressure) may be determined at the exit plane of the duct once the acoustic quantities have been calculated. This, the proper, radially varying boundary condition may be determined at the duct exit plane through the use of this method as well as the radiated sound field. (12 refs.)

118320 One procedure for inverting the Laplace transformation in problems of interaction between nonstationary waves and a spherical inclusion. A.G.Gorshkov, V.B.Poruchikov, D.V.Tarlakovskii.
Mech. Solids (USA), vol.18, no.1, p.75-82 (1983). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.18, no.1, p.82-90 (1983).
The most frequently employed method of solving axisymmetric problems of dynamics of a thick-walled elastic sphere that is filled and surrounded with elastic or acoustic media is the Laplace transformation with respect to time. With this approach, however, all the difficulties are carried over to the problem of calculating the original corresponding to the resultant solution in the transform space. The authors present a method for calculating the original based on a series expansion of the transforms in exponents. The resultant formulas make it possible to obtain an analytic solution for the problems under consideration. (7 refs.)

118321 Interior and exterior resonances in acoustic scattering. II. Targets of arbitrary shape (*T*-matrix approach). H.Uberall, G.C.Gaunaurd, E.Tanglis (Naval Surface Weapons Center, White Oak, Silver Spring, MD, USA).
Nuovo Cimento B (Italy), vol.77B, ser.2, no.1, p.73-86 (11 Sept. 1983).
For pt.I see ibid., vol.76, p.153 (1983). The *T*-matrix approach, which describes the scattering of acoustic waves (or of other waves) from objects of arbitrary shape and geometry, is here 'married' to the resonance scattering theory in order to obtain the (complex) resonance frequencies of an arbitrary shaped target. For the case of the nearly impenetrable targets, the authors split the partial-wave scattering amplitudes into terms corresponding to internal resonances, plus an apparently nonresonant background amplitude which, however, contains the broad resonances caused by external diffracted (or Franz-type, creeping) waves, in addition to geometrically reflected and refracted (ray) contributions. (10 refs.)

(see also 92.60 Meteorology)

118322 An aeroacoustic model for high-speed, unsteady blade-vortex interaction. R.Martiniz, S.E.Widnall (MIT, Cambridge, MA, USA).
AIAA J. (USA), vol.21, no.9, p.1225-31 (Sept. 1983).
A three-dimensional aeroacoustic model is developed to predict the sound pulse radiated by the passage of a helicopter blade over a potential vortex. The linearized analysis assumes that either the blade-vortex separation is small or that the blade-tip Mach number is close to 1, or both, so that an acoustically noncompact situation exists. The three-dimensional blade loading due to blade-vortex interaction is constructed through a spanwise superposition of two-dimensional solutions with strength linearly increasing from hub to tip. Such a loading overestimates somewhat the strength of tip region dipoles in the acoustic calculation that follows. The final expression for the predicted far-field signature is obtained in closed form, and thus permits a relatively inexpensive calculation of the directivity of peak acoustic pressures in three dimensions. (12 refs.)

118323 Noise generation by a low-Mach-number jet. J.Laufer, Ta-chun Yen (Dept. of Aerospace Engng., Univ. of Southern California, Los Angeles, CA, USA).
J. Fluid Mech. (GB), vol.134, p.1-31 (Sept. 1983).
Using a 'clean' jet facility the relationship between the jet flow and its radiation field was studied experimentally in the Mach-number range $0.05<M_{\mathrm{j}}<0.20$ and a Reynolds-number range $6\times10^4<Re_{\mathrm{D}}<2.3\times10^5$. The various acoustic source parameters such as strength, frequency and Mach number were varied systematically, and the far-field pressure measured simultaneously. On the basis of these measurements the nature of the sources in the initial shear layer could be characterized. The principal results, equally valid for unexcited and excited jets, are as follows: the acoustic sources are not convected but are located within a confined volume fixed with respect to the nozzle even though they are being generated by moving disturbances in the jet; they are associated with the nonlinear saturation of the unstable wave amplitudes of the shear layer occurring at the vortex-pairing locations; the radiation intensity varies nonlinearly with the source strength and is highly directional, exponential in character. (19 refs.)

(see also 92.10 Physics of the ocean)

118324 Information principles of active sonar detection. Zhu Ye, Chen Geng (Inst. of Acoustics, Acad. Sinica, Peking, China).
Acta Acust. (China), vol.8, no.3, p.168-78 (May 1983). In Chinese. [received: Oct. 1983]
The relation between three main factors (waveform, channel and receiver) of active sonar is discussed. The models of the active sonar channel, which include marine reverberation, signal propagation and object scattering in sonar processes, are described, by a generalized scattering function and a generalized coherence function. Physical significance and measuring method of both functions are explained with the aid of channel output correlation functions and matched filter outputs. Finally, the fundamental principles for the design of the optimum waveform and the optimum receiver are presented. (15 refs.)

118325 Isolating apartments and offices from ground borne vibrations. P.Moss.
Noise & Vib. Control Worldwide (GB), vol.14, no.7, p.183-5 (Sept. 1983).
From the outside, Cresta House, situated in Finchley Road, London, UK, appears to be a fairly normal building structure; however, the entire superstructure from the foundation level upwards is built on elastomeric bearings. The project, which comproises flats, offices and shops, is situated next to the underground tunnel of the Metropolitan Railway line which runs parallel to and beneath Finchley Road at this point. Very early in the design stage, acoustics vibration and noise specialists, Grootenhuis Allaway Associates, were consulted for advice on the problems connected with ground-borne transmitted vibrations from nearby underground railways. It was found that vibration levels from previous site surveys carried out for similar projects, were such that if elastomeric bearings were not employed, perceptible levels of vibration would be felt in the proposed building structure. As the development comprised domestic flats and high quality office accommodation, the clients

decided it would be beneficial to ensure that steps had been taken to isolate the structure practically and economically. (no refs.)

43.50 NOISE, ITS EFFECTS AND CONTROL

(see also 86.70J Environmental science)

118326 Noise measurement and cost efficiency analysis exemplified by the 'whispering tractor'. B.Stasch.
Elektrotech. & Maschinenbau (EuM) (Austria), vol.100, no.8, p.340-2 (Aug. 1983). In German.
The author refers to the complexities of noise measurement and abatement and describes a tractor that was built on behalf of the Ministry of Health and Ecology in Vienna in conjunction with the Technical University there. Details are given for suppressing sound emission by 20 dB(A) in the propulsion system at 1 metre at maximum revolutions, and it is claimed that quiet tractors could be mass produced with only a 3-5 per cent increase in cost. The improvement pertains to diesel engines. Petrol-driven production model cars do not achieve comparable results and this indicates a need for research. (no refs.) *H.G.*

118327 Noise generated by airfoil profiles placed in a uniform laminar flow. H.Arbey, J.Bataille (Lab. de Mecanique des Fluides, Ecole Centrale de Lyon, Ecully, France).
J. Fluid Mech. (GB), vol.134, p.33-47 (Sept. 1983).
The authors' paper is devoted to the experimental study of the noise generated by an airfoil profile placed in a uniform laminar flow. The far-field acoustic spectrum is shown to be composed of a broadband contribution around frequency f_s and a discrete contribution at equidistant frequencies f_n, which follow power laws of the forms $f_s \sim U^{1.5}$ and $f_n \sim U^{0.85}$. Both contributions can be accounted for by a simple model derived from the original suggestions of Tam (1974) and Fink (1975). It is essentially assumed that the diffraction of the Tollmien-Schlichting instabilities by the trailing edge generates acoustic waves which propagate in the far field and also trigger an aeroacoustic feedback loop, whose length is equal to the distance between the trailing edge and the maximum velocity point of the airfoil. (17 refs.)

118328 Sounbd barriers to control noise.
Noise & Vib. Control Worldwide (GB), vol.14, no.7, p.195-7 (Sept. 1983).
In practice, acoustical enclosures are constructed to completely enclose the noise-emitting equipment, whilst sound barriers are installed, the main difference being that while a very high degree of sound insulation can be achieved with acoustical enclosures, sound barriers give much less satisfactory results. Sound insulating barriers (mostly moveable screens) are usually employed when unusual high-noise sources are to be rapidly but temporarily coped with, or when a full enclosure is not feasible. A rapid method is developed for evaluating the sound-deadening properties of a screen used indoors, when the premises' acoustic characteristics are fairly well known. (no refs.)

43.60 ACOUSTIC SIGNAL PROCESSING

118329 A three dimensional model for generating the texture in B-scan ultrasound images. M.M.Goodsitt, E.L.Madsen, J.A.Zagzebski (Dept. of Medical Phys., Univ. of Wisconsin, Madison, WI, USA).
Ultrason. Imaging (USA), vol.5, no.3, p.253-79 (July 1983).
A three-dimensional model for production of gray scale texture in ultrasound B-mode images is described. The model computes time-dependent echo signals resulting from scattering of acoustic pulses by particles randomly distributed in an attenuating medium and transforms these signals into a gray scale image. Specific transducer and pulser-receiver characteristics are accounted for, as well as the three-dimensional nature of the problem, without loss of computational efficiency. The model generates texture that closely corresponds to that found experimentally in ultrasound images of tissue-mimicking phantoms. The dependence of the texture upon the depth of the region that was scanned and on the characteristics of the transducer-receiver system were clearly demonstrated. Good agreement between theory and experiment was found for the texture in phantoms containing simulated spherical low-scatter tumours. (18 refs.)

The improvement and quantitative assessment of B-mode images produced by an annular array/cone hybrid .... See Entry 121086

43.63 ACOUSTIC HOLOGRAPHY

118330 An application of holographic interferometry to acoustical holography. M.Ueda, K.Kagawa, S.Yamazaki, Y.Yoshikawa, K.Iwata (Faculty of Education, Fukui Univ., Fukui, Japan).
Optik (Germany), vol.65, no.3, p.219-26 (1983).
Holographic inteferometry with a phase-modulated reference beam is applied to acoustic holography. A very thin, flexible, optically reflective membrane, called a pellicle is used in the liquid as an acousto-optic interface. The method involves three processes: the motion of a pellicle caused by an ultrasonic wave is recorded as an optical hologram using holographic interferometry; the optical hologram is reconstructed to form an image on the pellicle which is used as an acoustic hologram; the acoustic hologram is finally used to reconstruct an image of the original object by illuminating it by laser light. A preliminary experiment is done with an ultrasound of frequency 1 MHz. (13 refs.)

43.70 SPEECH COMMUNICATION

(inc. speech perception, speech intelligibility, and speech synthesis; see also 87.36 Speech)

118331 Instantaneous voice period measurement for cochlear stimulation. D.M.Howard, A.J.Fourcin (Dept. of Phonetics & Linguistics, Univ. Coll. London, London, England).
Electron. Lett. (GB), vol.19, no.19, p.776-8 (15 Sept. 1983).
A peak-picking method for measuring the instantaneous period of voiced speech is described and compared with three other well documented techniques. It has been developed for use with a cochlear prosthesis to provide electrically stimulated hearing in a number of totally deaf adults. In this way both receptive and productive abilities can be substantially improved. (7 refs.)

118332 An extraction of information of individuality based on the sense of voice quality. M.Yokoyama (Dept. of Electrical Engng., Ritsumeikan Univ., Kyoto, Japan), K.Inoue.
Mem. Res. Inst. Sci. & Eng. Ritsumeikan Univ. (Japan), no.41, p.71-7 (1982).
Describes the extraction of the senses of the voice quality which characterize a similarity of speakers in speech, and of acoustic physical parameters which prescribe voice qualities. Experiments of similarity judgments of all possible combinations on speech samples (vowel /e/) by listeners are performed. Six commonly used terms that describe voice qualities are used as similarity judgments. A fundamental frequency and formants are utilized as acoustic parameters. From results of analyses based on the correlational method and the multidimensional scaling (MDS) technique for these experimental data, it became clear that the similarity sense of speakers correlates with not only 'pitch sense' but also other senses of the voice quality, and specified acoustic parameters contribute to the senses of the voice quality. (6 refs.)

118333 As to the volume indication of speech sounds—volume indicators for deaf persons. D.Mehnert (Humboldt Univ. Berlin, Berlin, Germany).
Nachrichtentech. Elektron. (Germany), vol.33, no.9, p.383-5 (1983). In German.
Deaf persons often have a speech volume width deviating from the standard. Either it is too small, or—as in most cases—too wide. This results in speech sounding unnatural and remaining unintelligible for the communication partner. After preliminary remarks as to the speech volume two volume indicators for the optical indication of sound level values are presented. Technical details are mentioned and experience in the school-practical trial stated. (7 refs.)

118334 Assistance in oral learning of a foreign language using a speech recognition system. M.T.Janot-Giorgetti, M.Lamotte (Univ. de Nancy I, Vandoeuvre-les-Nancy, France).
Rev. Phys. Appl. (France), vol.18, no.9, p.595-610 (Sept. 1983). In French.
A computerized system for assistance in oral learning of a foreign language is presented. In this system a speech recognition method has been implemented on a microprocessor. Mispronunciations are automatically detected among those previously memorized in the system for each word of a given lesson. Difficulties in phonetics and position of the stressed syllables which are typical of the spoken English language have been tested to determine the effectiveness of the system. (12 refs.)

43.75 MUSIC AND MUSICAL INSTRUMENTS

118335 Flexural vibration of truncated elliptical cone and Chinese chime bells. Cheng Tong, Zhen Da-Rui (Inst. of Acoustics, Acad. Sinica, Peking, China).
Acta Acust. (China), vol.8, no.3, p.129-34 (May 1983). In Chinese. [received: Oct. 1983]
The authors model the Chinese chime bell as a truncated elliptical cone. The flexural vibration of an elliptical cone is analysed for the fundamental modes of vibration of chime bells. An approximate expression for the frequency of the two tones of a chime bell is derived. (4 refs.)

118336 Comments on 'The quality of strings for guitars: an experimental study'. R.J.Hanson (Dept. of Phys., Univ. of Northern Iowa, Cedar Falls, IA, USA).
J. Sound & Vib. (GB), vol.90, no.2, p.283-5 (22 Sept. 1983).
Discusses several aspects of the paper by Dayan and Behar (see ibid., vol.64, p.421, 1979) on the quality of guitar strings. That paper reported the correlation of acoustical measurements (mainly sound levels and frequencies of the fundamental and overtones) with the subjective quality of 'goodness' of guitar strings. (1 ref.)

43.85 ACOUSTICAL MEASUREMENTS AND INSTRUMENTATION

(for acoustic noise measurement, see also 43.50; for photoacoustic spectroscopy, see 07.65)

118337 A microprocessor-controlled audiometer of the Bekesy type for high frequencies, and its use. J.M.Arnett,Jr., J.J.Knight (Inst. of Laryngology & Otology, Univ. of London, London, England).
Acoust. Lett. (GB), vol.6, no.12, p.172-7 (June 1983).
Work to date on hearing thresholds in the range 10-20 kHz has used either conventional pure tone or, alternatively, fixed frequency self-recording methods. To give more detailed information on the high frequency thresholds, a swept-frequency Bekesy type audiometer, with a pulsed tone presentation, has been developed. As the effect of ageing is a major factor in hearing sensitivity at high frequencies, knowledge of the variation of normal thresholds with age is fundamental to any diagnostic application. (7 refs.)

118338 Pulse compression acoustic microscopy at 750 MHz. M.Nikoonahad, G.Q.Yue, E.A.Ash (Dept. of Electronic & Electrical Engng., Univ. Coll. London, London, England).
Electron. Lett. (GB), vol.19, no.19, p.782-4 (15 Sept. 1983).
A pulse compression acoustic microscope working at a centre frequency of 750 MHz is reported. The pulse expansion and compression is achieved by SAW dispersive delay lines. The transmitted chirp has a bandwidth of 150 MHz and a dispersion of 1 MHz/ns. A processing gain in excess of 10 dB has been achieved. (3 refs.)

118339 Ultrasound imaging. M.Fink (Lab. d'Acoustique Moleculaire, Univ. Louis Pasteur, Strasbourg, France).
Rev. Phys. Appl. (France), vol.18, no.9, p.527-56 (Sept. 1983). In French.
Simultaneously to the development of new imaging techniques (X-ray scanner, NMR imaging, synthetic aperture radar...) spectacular progress in ultrasound imaging has been made in recent years. Following a summary of imaging ultrasound principles, the article reviews main attempts performed in this research area. An evaluation of the various ultrasound techniques is done in the fields of medical diagnosis, non-destructive testing and underwater imaging. After a comparison between these various techniques, the emphasis is put on the characteristics of ultrasound imaging techniques. The new area of echotomography is described. The use of sophisticated signal processing techniques enables this new approach in echography, which must lead soon to a quantitative imaging of acoustical parameters. (64 refs.)

118340 Voltage and current amplifiers in ultrasonic equipment. V.M.Geller, M.B.Gitis (All-Union Nondestructive Testing Res. Inst., Kishinev, USSR).
Sov. J. Nondestr. Test. (USA), vol.19, no.2, p.84-7 (Feb. 1983). Translation of: *Defektoskopiya (USSR)*, vol.19, no.2, p.7-11 (Feb. 1983). [received: Oct. 1983]
Aspects are considered in the choice of input conditions for a signal amplifier in a receiving transducer, including the noise immunity. (7 refs.)

43.88 TRANSDUCTION; DEVICES FOR THE GENERATION AND REPRODUCTION OF SOUND

118341 Microphone sensitivity calibration under high intensity sound. Zhang Ru-Wei, Zhang Bai-Ling (Inst. of Acoustics, Acad. Sinica, Peking, China).
Acta Acust. (China), vol.8, no.3, p.135-9 (May 1983). In Chinese. [received: Oct. 1983]
The change of sensitivity of the condenser microphones CH 16 and BK 4136 etc. are estimated and calibrated under the high intensity sound. The sensitivity of microphones as described above was calibrated by a high pressure microphone calibrator Type 4221: the range of sound pressure level was from 140 dB to 161.6 dB. In general, the maximum change of sensitivity for these microphones was less than 0.3 dB. As compared with the result of pistonphone calibration, the maximum difference was less than 0.4 dB, i.e. within the limits of experimental error. In addition, similar experiments were carried out under the high intensity sound from 168 dB to 173 dB and the same result was obtained. The experiment results were in agreement with the results of the theoretical analysis. The method has proved that microphone sensitivity calibrated by pistonphone can be used for the microphone intended for high intensity sound (below 170 dB). (2 refs.)

118342 Surface acoustic wave FM generators with large frequency deviation. L.N.Lutsyuk, A.A.Palamarchuk, A.T.Shostak.
Radioelectron. & Commun. Syst. (USA), vol.25, no.7, p.85-6 (1982). Translation of: *Izv. VUZ Radioelektron. (USSR)*, vol.25, no.7, p.78-9 (1982). [received: Oct. 1983]
Discusses how use of devices based on surface acoustic waves enables one, comparatively easily to design FM generators with a frequency modulation that does not vary with time, and which provide high deviation and high central-frequency stability. (5 refs.)

118343 The Y-parameter matrix of a surface wave filter with apodized transducers. A.N.Timoshenko.
Radioelectron. & Commun. Syst. (USA), vol.25, no.7, p.87-8 (1982). Translation of: *Izv. VUZ Radioelektron. (USSR)*, vol.25, no.7, p.80-1 (1982). [received: Oct. 1983]
The Y-parameter matrix of an ideal filter based on surface acoustic waves has been obtained. It holds for the case when the filter contains nonapodized interdigital transducers, i.e. when the surface waves excited by the transducers have a constant linear energy flux density along the front. Sometimes, in order to obtain the required amplitude-frequency characteristics of the surface acoustic wave filters, apodization of both interdigital transducers is employed. It therefore seems advisable to extend the matrix representation given to the case of the interaction of a surface acoustic wave that is nonuniform over the wavefront with apodized interdigital transducers. (6 refs.)

118344 Metal-insulator-semiconductor convolver. V.A.V'yun, A.A.Kreimer, I.B.Yakovkin (Inst. of Semiconductor Phys., Acad. of Sci., Novosibirsk, USSR).
Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.556-7 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1292-5 (Nov. 1982). [received: Sept. 1983]
One of the most promising nonlinear electroacoustic devices is the surface-acoustic-wave convolver. In the present experiments the authors studied a surface-acoustic-wave (SAW) convolver structure with a zinc oxide film on a silicon substrate. The zinc oxide films were deposited by cathode sputtering in a DC diode system. As substrates they used n-type silicon wafers with a resistivity of 4.5 Ω.cm (100) coated with a silicon dioxide layer 1000 Å thick. The authors used these structures to fabricate delay lines which operated in the band 140-160 MHz with an insertion loss of 26 dB without matching. The application of a static transverse field to the transducer region resulted in a modulation of the SAW excitation efficiency. As the voltage was varied from −1.5 to −10 V the SAW amplitude changed by 6 dB. 'Field' electrodes between the transducers transform this delay line into a metal-insulator-semiconductor convolver. 44.00 HEAT FLOW, THERMAL AND THERMODYNAMIC PROCESSES

44.10 HEAT CONDUCTION (MODELS, PHENOMENOLOGICAL DESCRIPTION)

118345 Enhancement of diffusive transfer by periodic pulsation between Dirichlet and Neumann type boundary conditions. S.J.Putterman, R.Guibert (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).
Appl. Sci. Res. (Netherlands), vol.40, no.3, p.271-7 (1983).
A solution of the equation of heat conduction is computed for the case where the boundary condition alternates periodically between fixed temperature and fixed heat flow. This problem is equivalent to a highly nonlinear parametric oscillation. Applications to energy conservative and nondestructive heating are discussed. (6 refs.)

118346 Prediction of interfacial filler thickness for minimum thermal contact resistance. P.W.O'Callaghan, B.Snaith, S.D.Probert (Cranfield Inst. of Technol., Cranfield, England).
AIAA J. (USA), vol.21, no.9, p.1325-30 (Sept. 1983).
A theoretical optimization procedure to establish the appropriate filler thickness for minimizing thermal contact resistance between flat nonwavy surfaces is developed and demonstrated. The analysis is founded upon the assumption of ideal plastic asperity deformation at the interface formed between randomly rough surfaces separated by the softer filler material. Experimental measurements of the thermal contact resistance for various contacting assemblies are presented to verify the prediction. (12 refs.)

118347 The non-stationary temperature distribution in heated pipelines. W.Haubitzer (Inst. fur Elektrotech., Montanuniv. Leoben, Leoben, Austria).
ETZ Arch. (Germany), vol.5, no.8, p.257-60 (Aug. 1983). In German.
The non-stationary temperature distribution is calculated using the Laplace-transformation, assuming a constant coefficient of thermal conductivity but no particular ambient temperature distribution. The temperature distribution may be expressed by a double series which converges well. (2 refs.)

118348 Measurement of fusion boundary energy transport during arc welding. C.S.Landram (Lawrence Livermore Nat. Lab., Livermore, CA, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.550-4 (Aug. 1983).
An experimental technique is presented to identify fusion boundary (liquid/solid interface) energy transport mechanisms during welding procedures. The gas-tungsten-arc spot-welding procedure, using a low melting point specimen material (lead), was chosen to demonstrate the methods. Vaporization energy losses were found to be important during the growth of the fusion boundary. Significant thermal convection was absent within the weld pool for applied currents less than about 100 A, and for such cases the location of the fusion boundary was found to be governed primarily by heat conduction. At the current levels of almost 300 A, significant weld pool convection was found to exist, especially at the (inner) stagnation point, causing a deeper penetration of the fusion boundary there. (18 refs.)

118349 A stochastic approach to thermal modeling applied to electrodischarge machining. S.M.Pandit, K.P.Rajurkar (Dept. of Mech. Engng., Michigan Technol. Univ., Houghton, MI, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.555-62 (Aug. 1983).
The usual method of making some simplifying assumptions and formulating thermal models that yield results confirmed by experiments does not work in many cases where the problem is complex and random. Electrodischarge machining (EDM) is such a process that is not only complicated and random but also physically little understood. The paper illustrates thermal modeling of this process with the help of a recently developed stochastic methodology called data dependent systems (DDS). An equation to the melting isothermal curve is defined from the DDS (stochastic empirical) model obtained from readily measurable surface profiles of actual machined surfaces created by the random superposition of electrical discharges. This equation of the melting isothermal curve is then combined with the heat conduction equation, under rather realistic and intuitively obvious assumptions, to develop a transient temperature distribution. The form of this (hybrid) thermal model is mathematically much simpler and yet its predictions are much closer to the experimental results, compared to the complicated models proposed in the literature. (25 refs.)

118350 The one-dimensional analysis of fin assembly heat transfer. M.Manzoor, D.B.Ingham (Dept. of Appl. Math. Studies, Univ. of Leeds, Leeds, England), P.J.Heggs.
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.646-51 (Aug. 1983).
The design of finned surfaces is conventionally performed in two stages. First the fin efficiency is determined by simultaneously analyzing the conductive heat flow within the fin, and the convective heat dissipation from the surface of the fin. Then, the effects of the thermal interaction between the supporting interface and the fins and the convective heat exchange at the plain side of the supporting interface are incorporated by employing a technique based on electric circuit theory. In this study, it is shown that this technique in fact has a mathematically rigorous foundation. It is also shown that, for design purposes, there is a far superior alternative to the fin efficiency. (16 refs.)

118351 Heat conduction in anisotropic wedge and elliptic cylinders. S.C.Huang (Dept. of Mech. Engng., Southern Univ., Baton Rouge, LA, USA), Y.P.Chang.
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.674-7 (Aug. 1983).
Presents the analytical solution of heat conduction in a wedge and an elliptic cylinder of an anisotropic medium which is homogeneous in rectangular coordinates. Both steady and unsteady states are considered. By a number of coordinate transformations, these problems can be solved by many standard methods. Only the results obtained by the separation of variables are shown. The transformed equations are also useful for numerical solution. (15 refs.)

118352 Conductive heat transfer between eccentric cylinders with boundary conditions of the third kind. R.F.DiFelice,Jr. (General Electric Co., Philadelphia, PA, USA), H.H.Bau.
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.678-80 (Aug. 1983).
The authors consider conductive heat transfer in an eccentric annulus, between a buried pipe and the surface of a semi-infinite medium, and between two pipes embedded in an infinite medium. Each of these geometrical configurations is germane to various industrial problems, such as heat losses through eccentric insulations and heat losses from buried pipes. (6 refs.)

118353 Temperature waves in materials with thermal memory. A.G.Shashkov, S.Yu.Yanovskii.
Vestsi Akad. Navuk BSSR Ser. Fiz. Energ. Navuk, no.3, p.79-82 (1983). In Russian.
A steady-state process in one-dimensional isotropic media has been considered in terms of the heat conduction theory with allowance for the thermal Gurtin-Pypkin memory. The decay coefficient and wave phase velocity as a function of the frequency and relaxation parameters of a heat flux and internal energy have been obtained and analyzed. (7 refs.)

118354 A method for the solution of the equations of a viscous heat-conducting gas. V.I.Pinchukov.
Zh. Vychisl. Mat. & Mat. Fiz. (USSR), vol.23, no.4, p.901-9 (July-Aug. 1983). In Russian. English translation in: *USSR Comput. Math. & Math. Phys. (GB)*
A conditionless difference scheme is proposed for a numerical solution of the equations of a viscous compressible heat-conducting gas, written in arbitrary curvilinear coordinates, having a second order approximation in smooth solutions and monotonic in regions with large gradients. Results of test calculations are presented, including the calculation of accurate solutions, obtained by the introduction of the original terms into the equations. (17 refs.) *A.G.C.*

118355 Nonlinear boundary value problem for the steady-state one-dimensional heat conduction equation. P.Fernandes, R.Parodi.
Report INFN/TC-83/10, Ist. Naz. Fis. Nucl., Genoa, Italy (6 May 1983), 6 pp.
The numerical solution is discussed of a two-point boundary value problem, arising in RF superconductivity, for the steady-state one-dimensional heat conduction equation with thermal conductivity depending on temperature and boundary conditions nonlinearly involving temperature and heat flux. The numerical method employed attains a great computational saving in comparison with standard ones by taking advantage of the particular features of the problem and can be likewise applied to other problems. The general mathematical form a problem must have for being solved by the aforementioned method is then laid down. (4 refs.)

44.30 HEAT TRANSFER IN INHOMOGENEOUS MEDIA AND THROUGH INTERFACES

118356 Continuity of the temperature in the two-phase Stefan problem. L.A.Caffarelli, L.C.Evans (School of Maths., Univ. of Minnesota, Minneapolis, MN, USA).
Arch. Ration. Mech. & Anal. (Germany), vol.81, no.3, p.199-220 (1983).
The classical two-phase Stefan problem, a model for ice-water melting, gives rise to a singular, nonlinear partial differential equation which admits a unique weak solution. Here the authors prove that this solution, and therefore the temperature in the Stefan problem, are continuous. (8 refs.)

Method of calculating electromagnetic and thermal fields in electrically conducting bodies during induction heating .... See Entry 118033

44.40 RADIATIVE HEAT TRANSFER

118357 Experimental determination of nocturnal radiation. J.Doria, J.I.Ajona, M.R.Heras, A.L.Tovar (Facultad de Ciencias Fisicas, Univ. Complutense, Madrid, Spain).
An. Fis. Ser. B (Spain), vol.79, no.2, p.188-93 (May-Aug. 1983). In Spanish. [received: Oct. 1983]
The radiative heat transfer from cultivated soils are deeply modified when covered with a transparent material. The authors find out the relation between the optical spectra of the covers and the thermal situation they induce on the surface, as well as the energetic losses produced by radiative cooling to the outer space from the cover. (5 refs.)

118358 Experimental determination of the transference parameters of a nonconvecting solar pond. M.C.de Andres, J.Doria (Facultad de Ciencias Fisicas, Univ. Complutense, Madrid, Spain).
An. Fis. Ser. B (Spain), vol.79, no.2, p.194-201 (May-Aug. 1983). [received: Oct. 1983]
An experimental prototype of nonconvecting solar pond at laboratory scale has been developed for the accurate determination of the heat transfer parameters. These are essential for the resolution of solar ponds heat transfer equations. As these parameters are obtained from the energetic balances in the nonconvecting zones, in local stationary state, it has been necessary to control heat transfer by means of heating bands. (4 refs.)

118359 A line-by-line calculation of low-resolution radiative properties of CO_2-CO-transparent nonisothermal gases mixtures up to 3000K. J.Taine (Groupe de Recherches Thermiques, Ecole Centrale des Arts et Manufactures, Chatenay-Malabry, France).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.30, no.4, p.371-9 (Oct. 1983).
Low-resolution radiative properties (absorptivities, transmissivities, intensities) of nonisothermal or inhomogeneous gas mixtures at high temperatures, suitable for radiative heat transfer applications (e.g. in combustion) are obtained from a line-by-line calculation, using recently published high-resolution spectroscopic data at 296K given by AFGL. It is shown that absorptivities obtained for isothermal mixtures of CO_2, CO, N_2 (and sometimes H_2O) agree with the corresponding measured spectra. (43 refs.)

118360 Method of solution of radiative conductive heat transfer equations. A.I.Zuev, N.G.Karlykhanov.
Zh. Vychisl. Mat. & Mat. Fiz. (USSR), vol.23, no.4, p.910-21 (July-Aug. 1983). In Russian. English translation in: *USSR Comput. Math. & Math. Phys. (GB)*
A method is examined for the solution of a problem of radiative-conductive energy transfer in a nonstationary multigroup kinetic approximation for a description of thermal radiation. In the framework of the proposed method a combinational method of solution is constructed for the case when in various parts of the region determinations of the original equations lead to different approximations. The effectiveness of the proposed method is illustrated by solving model problems. (15 refs.) *A.G.C.*

44.50 THERMAL PROPERTIES OF MATTER (PHENOMENOLOGY, EXPERIMENTAL TECHNIQUES)

(see also 07.20 Thermal instruments and techniques)

118361 The accuracy of heat conductance measurements with cylindrical samples. W.Jablonski, B.Wnetrzewski (Politechn. Warszawska, Warsaw, Poland).
Szklo & Ceram. (Poland), vol.34, no.4, p.136-8 (July-Aug. 1983). In Polish.
Different sources of error are consecutively discussed. Especially important is the exact location of the thermocouples within the sample. The results of the discussion may have practical value for measurements of heat conductance with cylindrical samples. (6 refs.)

118362 Heat transfer behavior of frozen soils. H.Inaba (Dept. of Mech. Engng., Kitami Inst. of Technol., Hokkaido, Japan).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.680-3 (Aug. 1983).
The thermal properties and unfrozen water content of various soils were examined experimentally by the transient probe method and calorimetric technique. It could be seen that measured values of effective thermal conductivity and specific heat show a strong dependence on the temperature, initial moisture content, and grain size of soil in the temperature range of $T=0$°C to -10°C. Unfrozen water content of the frozen soil increases as the grain size of soil decreases. The peculiar behavior for fine grain-sized soil of decreasing effective thermal conductivity with decreasing temperature, T, below 0°C was observed for large initial moisture content $w=30$-40 percent. 44.60 THERMODYNAMIC PROCESSES (PHENOMENOLOGY, EXPERIMENTAL TECHNIQUES)

(see also 05.70 Thermodynamics, 07.20 Thermal instruments and techniques)

118363 Pool boiling of drag-reducing polymer solutions. N.M.Ruai, S.I.Abdel-Khalik (Dept. of Nuclear Engng. Dept., Univ. of Wisconsin, Madison, WI, USA).
Appl. Sci. Res. (Netherlands), vol.40, no.3, p.209-22 (1983).
The effect of drag-reducing polymeric additives on the critical heat flux and minimum film boiling temperature in subcooled pool boiling of water has been experimentally examined. Three water-soluble polymers, viz. a polyethylene oxide (Aldrich No.18946-4), a poly-acrylamide (Separan AP-30), and a galactomannan polysaccharide (Galactasol-211) have been examined at concentrations of 10, 50 and 100 wppm. The experiment is performed by quenching a hot brass sphere in an isothermal pool of the fluid to be examined and obtaining the corresponding boiling curve. The experiments have been conducted at atmospheric pressure with a pool temperature of 90°C. The results show that the critical heat flux increases by more than 50% while the minimum film boiling temperature increases by more than 110°C when concentrations of 100 wppm of polyox or guar gum are used. For separan solutions, the critical heat flux and minimum film boiling temperatures are lower than those for water and go through a minimum at a concentration of ~ 1 wppm; the maximum reductions are about 73% and 34°C respectively. (12 refs.)

118364 A European heat-pipe experiment on the second flight of Space-Shuttle 'Challenger'. C.J.Savage (Dept. of Spacecraft Technol., ESTEC, Noordwijk, Netherlands).
ESA Bull. (France), no.35, p.76-81 (Aug. 1983).
The second flight of 'Challenger' caried a European heat-pipe experiment designed to measure the performance of constant-conductance heat pipes, variable-conductance heat pipes and diodes over a 24 h period. The experiment, sponsored jointly by ESA and the German Ministry of Science and Technology (BMFT), formed part of the first payload for the German Shuttle Pallet Satellite (SPAS-01). (no refs.)

118365 Critical heat flux for uniformly heated vertical channels with low ratios of heated length to heated equivalent diameter. Y.Katto, A.Sanada (Dept. of Marine Engng., Univ. of Tokyo, Tokyo, Japan).
J. Fac. Eng. Univ. Tokyo Ser. B (Japan), vol.37, no.1, p.1-15 (March 1983). [received: Oct. 1983]
When the ratio of heated length l to heated equivalent diameter d_{he} is reduced excessively for a uniformly heated channel, critical heat flux (CHF) may possibly change its character from that of a channel flow toward that of a heated surface in a parallel flow. The aim of this study is to clarify phenomenological outlines of this problem. In order to observe CHF under intermediate conditions between the channel and the parallel flow, experiments are made for flow boiling of R-113 in internally heated annuli of low l/d_{he} ratios with comparatively high mass velocities. Then, the data obtained are analyzed together with the existing data of CHF for low l/d_{he} ratios in the case of high mass velocities, from which tentative criteria are derived for the occurrence of channel flow CHF and parallel flow CHF. Finally, the existing data obtained for low l/d_{he} ratios in the case of low mass velocities are also analyzed clarifying a special character of CHF under these conditions. (25 refs.)

118366 Evaporation of water from a horizontal surface by natural convection. E.M.Sparrow, G.K.Kratz, M.J.Schuerger (Dept. of Mech. Engng., Univ. of Minnesota, Minneapolis, MN, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.469-75 (Aug. 1983).
Experiments were performed to measure the mass transfer coefficients for natural convection evaporation from a horizontal water layer. Owing to the latent heat requirements of the evaporation process, the temperature of the water layer is depressed relative to the ambient temperature. This gives rise to a buoyancy which overpowers the oppositely directed buoyancy associated with the concentration gradient of the water vapor. The experiments encompassed two orders of magnitude in the Rayleigh number and, in addition, the effects of two geometrical parameters were investigated. One of these is the size of a horizontal annular frame which surrounds the water containment pan, while the other is the step caused by the difference between the water level and the height of the pan sidewall. Both the presence of the frame and of the step decrease the mass transfer coefficient. Narrow frames give rise to a sharp decrease, but further enlargements of frame size have little additional effect. The step-height effect was found to be independent of both the Rayleigh number and the frame size, enabling a universal correlation. Furthermore, for all of the investigated steps and frames, $Sh \sim Ra^{0.205}$. (14 refs.)

118367 Transient response of gas-to-gas crossflow heat exchangers with neither gas mixed. F.E.Romie.
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.563-70 (Aug. 1983).
The transient mixed mean temperatures of the two gases leaving a crossflow heat exchanger are found for a unit step increase in the entrance temperature of either gas. The temperature responses are given in graphical form for the range of parameters: Ntu from 1 to 8, capacity rate ratio from 0.6 to 1.67, and conductance ratio from 0.5 to 2.0. The solutions are found using the Laplace transform method and apply to single-pass crossflow exchangers with neither gas mixed. (11 refs.)

118368 Analysis of mechanical-draught counterflow air/water cooling towers. J.W.Sutherland (Agricultural Engng. Group, CSIRO, Highett, Victoria, Australia).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.576-83 (Aug. 1983).
Compares an accurate analysis of mechanical draught counterflow cooling towers, including water loss by evaporation with the approximate common method based on enthalpy driving force developed by Merkel in 1925. Computer programs were developed for both the accurate analysis and the approximate analysis. Substantial underestimates of tower volume of from 5 to 15 percent are obtained when the approximate analysis is used, indicating the possibility of quite serious consequences as far as cooling tower design is concerned. Computer predictions of cooling tower integral are shown to compare well with published values. (27 refs.)

118369 Mean temperature difference in multipass crossflow. A.Pignotti, G.O.Cordero (Techint SA, Buenos Aires, Argentina).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.584-91 (Aug. 1983).
A procedure is developed to obtain analytical expressions for the mean temperature difference in crossflow heat exchangers with arbitrary number of passes and rows per pass. The influence of air mixing, along with different flow arrangements for the tube fluid between passes, is analyzed, both in co- and counter-crossflow. (11 refs.)

118370 Mean temperature difference charts for air coolers. A.Pignotti, G.O.Cordero (Techint SA, Buenos Aires, Argentina).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.592-7 (Aug. 1983).
Computer generated graphs are presented for the mean temperature difference in typical air cooler configurations, covering the combinations of numbers of passes and rows per pass of industrial interest. Two sets of independent variables are included in the graphs: the conventional one (heat capacity water ratio and cold fluid effectiveness), and the one required in an optimization technique of widespread use (hot fluid effectiveness and the number of heat transfer units). Flow arrangements with side-by-side and over-and-under passes, frequently found in actual practice, are discussed through examples. (10 refs.)

118371 Boiling heat transfer with Freon 11 (R11) in brazed aluminum, plate-fin heat exchangers. J.M.Robertson, P.C.Lovegrove (Engng. Sci. Div., AERE, Harwell, England).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.605-10 (Aug. 1983).
The results of laboratory experiments with Freon 11 (R11) flowing in an electrically heated, serrated-fin test section to measure local boiling coefficients over a wide range of vapor quality, with mass fluxes up to 150 kg/m^2 s, heat fluxes to 4 kW/m^2, and pressure from 3-7 bar, are reported. These low mass and heat fluxes reflect the industrial process application of these heat exchangers where exceedingly small temperature differences may exist between streams. Results are compared with the very similar boiling characteristics previously reported elsewhere for the same test section, with liquid nitrogen as a test fluid under comparable flow conditions. A simple method using the Reynolds number of the total flow regarded as a liquid has been used to correlate boiling heat transfer coefficients with quality for both fluids. The use of a liquid-film flow model to produce a nondimensional correlation connecting the Nusselt, Reynolds, and Prandtl numbers of the film is discussed. (18 refs.)

118372 A numerical finite difference method for performance evaluation of a periodic-flow heat exchanger. Chung-Hsiung Li (Dept. of Engng. Technol., C-E Air Preheater Co., Wellsville, NY, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.611-17 (Aug. 1983).
A numerical finite difference method is presented for calculating the fluid and metal temperature distributions for the periodic-flow type heat exchanger, accounting for the effect of heat conduction in the wall in the direction of fluid flow. Unlike previous solution techniques that use the Gauss-Seidel method based on a single element calculation, the method presented uses a column of elements to compute the fluids and metal temperature distributions, and it allows variable or constant thermal properties (specific heats, densities, heat transfer coefficients, and thermal conductivities). Nonuniform mass flow rates and a nonuniform grid spacing may be employed. The present method reduces the computational time required for convergence and improves the numerical stability while allowing an arbitrary metal temperature distribution as a starting case. After qualifying the numerical method, illustrative results are presented for counterflow and parallel flow rotary regenerators with three different surfaces in the flow direction and variable fluid and material properties. (13 refs.)

118373 Surface microfouling during the induction period. R.E.Baier, A.E.Meyer, V.A.DePalma, R.W.King, M.S.Fornalik (Advanced Technol. Center, Calspan Corp., Buffalo, NY, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.618-25 (Aug. 1983).
The time during which newly installed or cleaned heat transfer surfaces remain free of fouling deposits thick enough to diminish heat transfer coefficients or energy efficiency is often called the 'induction period', a term disguising lack of knowledge of the microfouling events actually occurring. Using novel flow cells to conduct water of fresh, brackish, and oceanic quality, natural and treated with antifouling chemicals, over test surfaces of different clean and coated metals, it has been observed that the initial pattern of fouling deposits is remarkably similar in all circumstances. Rapid adsorption of protein-dominated films is followed by attachment of rodlike bacteria, bacterial exudation, colonization by a second wave of prosthecate microorganisms, additional secretion, and growth of debris-trapping filamentous appendages. Although inappropriate to extrapolate the noted rates of these processes to in-plant heat exchangers at present, this sequence of microfouling events seems universal enough to characterize the induction period of all water-side biofouling phenomena. (13 refs.)

118374 Experimental observations of the microlayer in vapor bubble growth on a heated solid. L.D.Koffman, M.S.Plesset (Dept. of Engng. Sci., California Inst. of Technol., Pasadena, CA, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.625-32 (Aug. 1983).
Experimental measurements of microlayer formation and of the time history of microlayer thickness change have been obtained for nucleate boiling of water and ethanol. These detailed measurements were obtained using laser interferometry combined with high-speed cinematography. The measurement technique is discussed in detail with emphasis on the difficulties encountered in interpretation of the fringe patterns. The measurements for water can be reasonably applied to the data of Gunther and Kreith (1950), in which case it is concluded that microlayer evaporation alone cannot account for the increased heat transfer rates observed in highly subcooled nucleate boiling. It appears that microconvection must play at least an equal role. (25 refs.)

118375 Measurement of condensation curves for dropwise condensation of steam at atmospheric pressure. I.Tanasawa (Inst. of Industrial Sci., Univ. of Tokyo, Tokyo, Japan), Y.Utaka.
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.633-8 (Aug. 1983).
Condensation curves for dropwise condensation of steam at atmospheric pressure were measured for the range of surface subcooling between 0.5 and 180K using a heat transfer block having a concave spherical condensing surface. The heat transfer coefficient remained constant with the increase of surface subcooling up to about 10K, and then it decreased. The maximum heat fluxes were found to be between 9.3 and 12.2 MW/m^2. Dropwise condensation could be observed at a surface subcooling larger than the one corresponding to the peak heat flux, but shortly the mode of condensation shifted to pseudo-film or on-ice condensation. (6 refs.)

118376 Cauchy method for solidification interface shape during continuous casting. R.Siegel (Lewis Res. Center, NASA, Cleveland, OH, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.667-71 (Aug. 1983).
In 1978, an analysis was made to obtain the two-dimensional interface shape of a slab ingot being cast continuously by withdrawing it from a mold. A complexity in this type of problem is that the interface shape depends on the heat transfer conditions, and hence when solving for the heat conduction within the ingot the region shape must be determined simultaneously as part of the analysis. A conformal mapping method was used, and this yielded an exact solution for the interface shape. The shape was found to depend on a single parameter combining the casting velocity, width of the ingot, and the temperature depression of the cooled sides of the ingot below the solidification temperature. An alternative method for solving this type of problem is presented by the author. It is more compact than the conformal mapping method, and may be useful for other similar problems. (4 refs.)

118377 Experimental study of solidification heat transfer in an open rectangular cavity. C.J.Ho, R.Viskanta (School of Mech. Engng., Purdue Univ., West Lafayette, IN, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.671-3 (Aug. 1983).
Describes solidification heat transfer experiments which were performed in a rectangular, two-dimensional, open cavity cooled from the vertical sides and the bottom. The focus in the paper is on the evolution of the solidification front and correlation of the frozen volume fraction of the phase change material with dimensionless time. (11 refs.)

118378 Heat transfer through thin films: approximate analysis and determination of effective heat transfer coefficient. L.E.Bobisud (Univ. of Idaho, Moscow, ID, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.673-4 (Aug. 1983).
The transfer of heat through the surface of a material is involved in many engineering problems, for example, the determination of the temperature distribution in a cooling fin. In practical situations the surface is often overlaid with a coating of another substance—scale, tarnish, oil, paint, etc.—possessing properties different from those of the underlying material and changing the heat transfer characteristics of the composite. Typically, this layer is both thin and a relatively poor conductor of heat. Although one can analyze the full problem of heat transfer through the base material, through the thin layer, and from the surface of this layer, such an analysis is more difficult than that involved in the textbook case of no surface layer. The author shows how a related problem whose solution approximates the desired solution can be deduced when the surface layer is thin and poorly conducting, as is frequently the case. Low-order correction terms are also obtained. (2 refs.)

44.90 OTHER TOPICS IN HEAT FLOW, THERMAL AND THERMODYNAMIC PROCESSES

118379 Temperature on a spherical surface with internal heat liberation and jet streamline flow. L.K.Vukovich, V.I.Lelkov, A.V.Nikolaev, S.S.Timar, N.V.Tkach.
J. Appl. Mech. & Tech. Phys. (USA), vol.23, no.6, p.808-11 (Nov.-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR)*, vol.23, no.6, p.80-3 (Nov.-Dec. 1982). [received: Sept. 1983]
At present metal alloys and nonmetallic materials with lower thermal conductivity are finding application for the manufacture of shells. In addition their thermal conductivity is lowered (λ_m) as a result of thermal aging of the materials. In this connection an investigation of the effect of the thermal conductivity of the shell material on nonuniformity of the temperature in it is of interest for possibly a larger range of variation of λ_m. The effect of the geometrical characteristics, the thermal conductivity of the shell material, and the heat liberation power on nonuniformity of the temperatures in the shell is simply investigated with a single sphere. (4 refs.)

118380 The Idealized Structural Unit Method and its application to deep girder structures. Y.Ueda (Welding Res. Inst., Osaka Univ., Osaka, Japan), S.M.H.Rashed.

Comput. & Struct. (GB), vol.18, no.2, p.277-93 (1984).

An efficient method of analysis of nonlinear behavior until collapse of large size redundant structures is presented. The method is named as The 'Idealized Structural Unit Method'. In this method the structure is divided into the biggest possible 'Structural Units' whose geometric and material nonlinear behaviour can be idealized and described in a concise analytical-numerical form. The structure is reassembled and load is applied incrementally until ultimate strength is attained. In this method, modeling is an obvious operation of dividing the structure into its actual structural units. This eliminates the effort required for the choice of type of element or size of mesh as in the finite element method. The number of structural units and overall degrees of freedom required for the analysis of a structure by this method are less in order than the number of elements and overall degrees of freedom required to analyze the same structure by the FEM. Costs of computer and data preparation may be drastically reduced. (25 refs.)

118381 Motion of a material point under the action of a travelling sinusoidal wave. A.M.Tokar, A.F.Ulitko.

Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.7, p.50-2 (1983). In Ukrainian.

A differential equation is presented for material particle motion under the effect of an elastic travelling wave. One of the possible cases of motion is studied, namely, when the particle is given (at an average) ordered motion along the travelling wave propagation. (5 refs.)

118382 The response of multidegree-of-freedom systems with quadratic non-linearities to a harmonic parametric resonance. A.H.Nayfeh (Dept. of Engng. Sci. & Mech., Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).

J. Sound & Vib. (GB), vol.90, no.2, p.237-44 (22 Sept. 1983).

An analysis is presented of the response of multidegree-of-freedom systems with quadratic non-linearities to a harmonic parametric excitation in the presence of an internal resonance of the combination type $\omega_3 \approx \omega_2 + \omega_1$, where the ω_n are the linear natural frequencies of the systems. In the case of a fundamental resonance of the third mode, one can identify two critical values ζ_1 and ζ_2, where $\zeta_2 \geq \zeta_1$, of the amplitude F of the excitation. The value $F=\zeta_2$ corresponds to the transition from stable to unstable solutions. When $F<\zeta_1$, the motion decays to zero according to both linear and non-linear theories. When $F>\zeta_2$, the motion grows exponentially with time according to the linear theory but the non-linearity limits the motion to a finite amplitude steady state. The amplitude of the third mode, which is directly excited, is independent of F, whereas the amplitudes of the first and second modes, which are indirectly excited through the internal resonance, are functions of F. When $\zeta_1 \leq F \leq \zeta_2$, the motion decays or achieves a finite amplitude steady state depending on the initial conditions according to the non-linear theory, whereas it decays to zero according to the linear theory. This is an example of subcritical instability. In the case of a fundamental resonance of either the first or second mode, the trivial response is the only possible steady state. When $F \leq \zeta_2$, the motion decays to zero according to both linear and non-linear theories. When $F>\zeta_2$, the motion grows exponentially with time according to the linear theory but it is aperiodic according to the non-linear theory. (11 refs.)

118383 Optimization of Euler turning of nonlinear elastic object. A.E.Zakrzhevskii.

Mech. Solids (USA), vol.17, no.6, p.1-6 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.6, p.3-9 (1982). [received: Oct. 1983]

One form of programmed motion of a free rigid body, that is of interest for technical applications, is the mode of reorientation in inertial space. For both absolutely rigid and elastic bodies, this mode can be effected either by three successive turns by certain angles about axes that are rigidly attached to the undeformed body, or by one turn about the axis of equivalent rotation (Euler axis) which is fixed in inertial space and attached to the body. A solution is offered to the problem of optimizing the control of Euler turning of a nonlinear elastic object on the basis of the requirement of reducing the orientation noise and dynamic overloads that act on the elastic elements. (4 refs.)

118384 Stationary motion of a gyrostat with deformable plates and its stability in a Newtonian central force field. M.K.Nabiullin.

Mech. Solids (USA), vol.17, no.6, p.7-11 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.6, p.10-14 (1982). [received: Oct. 1983]

Using Lyapunov's direct method and previous theorems, on the basis of the idea of introducing the integral characteristics of motion of continuous media proposed in investigating problems of stability of motion of complex systems in relation to part of the variables, the author obtains and analyzes sufficient stability conditions for a family of relative equilibrium positions of a mechanical system consisting of a gyrostat and one pair of rectangular elastic plates that are symmetrically clamped in its housing. It is assumed that the center of mass of the system moves along a Keplerian circular orbit in a Newtonian central force field. (19 refs.)

118385 Determination of the orientation of the instrument trihedron using angle information. A.I.Tkachenko.

Mech. Solids (USA), vol.17, no.6, p.12-18 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.6, p.15-21 (1982). [received: Oct. 1983]

It is assumed that two right orthogonal trihedrons, whose mutual position is not known, are associated with a moving nondeformable object. The projections of the absolute angular velocity of the object onto the axes of the first (instrument) trihedron, and the kinematic parameters characterizing the position of the second associated trihedron relative to the specified inertial coordinate trihedron, are measured. By the vector matching method the author solves the problem of determining the orientation of the first associated trihedron relative to the inertial one. An important aspect of the proposed solution of this problem is the calculation of the vector parts of the quaternions characterizing the change in orientation of the object during two successive time intervals. (8 refs.)

118386 Suppression of plane vibrations of a platform using unbalanced suppressors. V.I.Babitskii, V.Sh.Burd.

Mech. Solids (USA), vol.17, no.6, p.25-9 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.6, p.29-33 (1982). [received: Oct. 1983]

Examines the possibilities for dynamic suppression of vibrations of an object by attaching two unbalanced masses to it. The authors seek to determine the alignment conditions for the unbalanced suppressors. (2 refs.)

118387 On the analysis of the force characteristics of the suspension of a cryogenic gyroscope. V.F.Zhuravlev, V.M.Rudenko.

Mech. Solids (USA), vol.18, no.1, p.7-13 (1983). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.18, no.1, p.9-15 (1983).

The authors propose an approximate calculation procedure for the force characteristics of the suspension of a cryogenic gyroscope, that yields the final formulas for the forces and stiffnesses of the suspension in the case of supporting coils or arbitrary (not necessarily circular) shape. The approach makes it possible to deal with problems of optimizing the shape and parameters of the coils of the suspension, as well as to make comparative analyses of different arrangements. The calculation method is an asymptotic one; the authors specify the limiting situation such that, as it is approached, the computational error tends to zero. For the particular case of a ring-shaped circuit with a current, the authors give upper and lower bounds for the relative error in determining the restoring force. (6 refs.)

118388 Kinematic control of the motion of a vessel with an ideal heavy fluid. L.D.Akulenko.

Mech. Solids (USA), vol.18, no.1, p.34-41 (1983). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.18, no.1, p.39-46 (1983).

The author investigates the plane problem of control of motion of a rigid rectangular vessel containing an ideal heavy fluid with a free surface. The relative motion of the fluid is described within the framework of the linear model of infinitely small waves. The author requires that the vessel execute prescribed motions at the end of the control process, and that there is no relative oscillation of the fluid. The author obtains approximate solutions that lead to simple control laws. The problem is of interest in controlling the motion of such entities as tankers, tanks and cisterns, and so forth. (12 refs.)

118389 Dynamics of soft braking systems. S.M.Belotserkovskii, I.V.Dneprov, A.T.Ponomarev, O.V.Rysev.

Mech. Solids (USA), vol.18, no.1, p.42-9 (1983). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.18, no.1, p.47-54 (1983).

Soft braking systems (parachutes) with various pattern geometries are extensively employed in aviation and space engineering. The process of opening (filling) and of motion of the load on the open parachute are important stages in the operation of such systems. In the filling process, the parachute is acted upon by the maximum aerodynamic loads, these being used as the basis for strength calculations for the structure. A feature of soft braking systems is that they constitute poorly streamlined surfaces, for which flow with separation is realized, and they take up only tensile loads. They display considerable displacements of the surface points of the canopy while the normal components of the velocity of the surface points are comparable to that of the primary flow. Problems of interaction between the load/parachute system and the flow reduce to investigation of a problem of aeroelasticity based on the apparatus of nonlinear aerodynamics and the theory of soft shells, which can be handled using modern computers. The authors study the problem in question using an approach that is based on a synthesis of numerical methods of nonlinear aerodynamics and elasticity theory, that involves successive solution of the equations of nonstationary nonlinear aerodynamics, generalized nonlinear elastic equations of Rakhmatulin type, and the equations of the dynamics of motion of a parachute and load. (7 refs.)

118390 An axisymmetric problem for a solid cylinder of finite length with weight. B.L.Abramyan.

Mech. Solids (USA), vol.18, no.1, p.50-6 (1983). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.18, no.1, p.55-62 (1983).

The author considers an axisymmetric problem for a solid cylinder of finite length acted upon by its own weight, in which the cylinder is attached on its lateral surface, while the bases of the cylinder are stress-free. The author reduces the solution of the problem to an infinite regular system of linear algebraic equations, and considers a numerical example. (9 refs.)

46.20 CONTINUUM MECHANICS

(see also 03.40 General mathematical aspects)

118391 Optimum design of plano-milling machine structure using finite element analysis. G.V.Ramana (Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA), S.S.Rao.

Comput. & Struct. (GB), vol.18, no.2, p.247-53 (1984).

The problem of optimum design of plano-milling machine structure is formulated as a nonlinear mathematical programming problem with the objective of minimizing the structural weight. The plano-milling machine structure is idealized with triangular plate elements and three dimensional frame elements based on finite element displacement method. Constraints are placed on static deflections and principal stresses in the problem formulation. The optimization problem is solved by using an interior penalty function method in which the Davidon-Fletcher-Powell variable metric unconstrained minimization technique and cubic interpolation method of one dimensional search are employed. A numerical example is presented for demonstrating the effectiveness of the procedure outlined. The results of sensitivity analysis conducted with respect to design variables and fixed parameters about the optimum point are also reported. (7 refs.)

118392 An axisymmetric Neumann potential problem for the circular annulus. E.N.Mastrojannis, T.Mura, L.M.Keer (Dept. of Civil Engng., Northwestern Univ., Evanston, IL, USA).

Comput. & Struct. (GB), vol.18, no.2, p.365-8 (1984).

The authors consider an axisymmetric three-part mixed boundary value problem wherein a Neumann condition is prescribed over a plane circular annulus and over the remainder of the plane of the annulus Dirichlet conditions are imposed. The problem is reduced to a problem of solving an infinite system of algebraic equations. Expressions are derived for the quantities of interest and some numerical results are given. (6 refs.)

118393 On a problem of structural dynamics. C.Cubeddu (Math. Inst., Univ. of Cagliari, Cagliari, Italy).

J. Mec. Theor. & Appl. (France), vol.2, no.4, p.559-66 (1983).

The equivalent static forces induced by earthquakes in shear-type frame structures can be expressed in a simplified form. It is shown that the structural response to an earthquake cannot, generally speaking, be represented just by the first three modes of vibration, as currently stipulated by the Italian Seismic Code. (7 refs.)

118394 Numerical plastic shakedown analysis of plates and shells of revolution by equilibrium finite elements. P.Morelle, Nguyen Dang Hung (Univ. de Liege, Liege, Belgium).
J. Mec. Theor. & Appl. (France), vol.2, no.4, p.567-99 (1983). In French.
Deals with the shakedown analysis of rotational plates and shells subjected to variable axisymmetric loading. The considered material is elastic-perfectly plastic with sandwich Tresca yield condition. The method is based on the Melan theorem of shakedown and this leads to lower bounds of the loading domain. Finite element techniques and mathematical programming procedures are used to obtain the solutions. (16 refs.)

118395 Carrying capacity of fibre bundles with varying strength and stiffness. J.Hult (Div. of Solid Mech., Chalmers Univ. of Technol., Gothenburg, Sweden), L.Travnicek.
J. Mec. Theor. & Appl. (France), vol.2, no.4, p.643-57 (1983).
The load-elongation characteristics of fibre bundles under tension is analyzed assuming certain variations of constitutive parameters among the fibres. Similarities are shown to exist between few-fibre bundles and a fibre continuum. Conditions for gradually occurring or instantaneous rupture are derived assuming various forms of the stress-strain curves. (14 refs.)

118396 Axisymmetric problem for elastic medium with a spherical inclusion weakened by a crack at the interphase boundary. M.A.Martinenko.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.7, p.38-42 (1983). In Ukrainian.
A problem on the stressed state of an elastic medium with a spherical inclusion when there is a crack at the interface is solved by exact methods of the linear theory of elasticity. At first the problem is reduced to an interrelated system of paired equations with respect to the Legendre functions, and then to a system of singular integral equations relative to two unknown functions. The behaviour of the equation solutions is studied near the interface circle of a spherical section. (6 refs.)

118397 Spatial problem for a deformable cone with a symmetrically disturbed surface. Yu.M.Nemish.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.7, p.42-5 (1983). In Ukrainian.
Three-dimensional boundary-value problems of deformable solid mechanics are discussed. The solid is bounded by a nearly conical surface. The solution procedure for such a problem is based on general ideas of the theory of disturbances. (8 refs.)

118398 Optimal strength design of beam-columns. S.Kanagasundaram, B.L.Larihaloo (Dept. of Civil Engng. & Surveying., Univ. of Newcastle, Newcastle, NSW, Australia).
Int. J. Solids & Struct. (GB), vol.19, no.11, p.937-53 (1983).
Considers the optimal design of elastic beam-columns which are acted upon simultaneously by an axial compressive and transverse forces. The design has to be such that it uses the least amount of material to achieve a prescribed strength under given loading conditions. Strength constraints are imposed to limit the intensity of maximum normal (flexural and axial) and shear stress within the member. The optimal designs are also checked against serviceability and buckling requirements. Concepts from Differential Game Theory are employed for the solution of the optimization problem. Solutions are presented for beam-columns of different cross-sectional shapes and boundary conditions subjected to various combinations of axial and transverse forces. (12 refs.)

118399 Fluid-structure interaction via boundary operator method. M.M.Cepkauskas, J.A.Stevens (Combustion Engng. Inc., Windsor, CT, USA).
J. Sound & Vib. (GB), vol.90, no.2, p.229-36 (22 Sept. 1983).
This paper is an examination of a simple fluid-structure interaction problem in which a technique for solving time dependent boundary condition problems, the boundary operator method (BOM), is used to gain further insight into fluid-structure response characteristics. The fluid-structure system consists of a compressible liquid having an acoustic pump at one boundary and a spring mass at the other boundary. The response of the spring mass as a result of the acoustic pulsations of the pump is the quantity of interest. This simple model closely represents a PWR core support barrel when excited by pressure waves due to circulating pump pulsations. The general solution of the pressure via the BOM is obtained as a function of the unknown spring mass response. This pressure is evaluated spatially at the spring mass end and the resulting equation of motion for the spring mass is found to be an integral-differential equation. Formulating the solution of the integral differential equation for a harmonic pump pulsation one obtains a normalized displacement of the spring mass as a function of three parameters. These parameters consist of a fluid to structure mass ratio, forcing frequency to uncoupled liquid natural frequency, and a ratio of forcing frequency to uncoupled structural frequency. A study is performed to determine the influence of the three parameters on the structural response. (8 refs.)

118400 Perturbation method in problems of optimizing plates of variable thickness. A.S.Bratus.
Mech. Solids (USA), vol.17, no.6, p.123-30 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.6, p.135-42 (1982). [received: Oct. 1983]
Considers problems of optimal design of beams and plates of variable thickness. Under the assumption that the control function (thickness) assumes values that differ from a fixed value in relatively narrow limits, the author constructs a solution that differs from the optimal solution with respect to the functional by a quantity on the order of the square of the perturbation. Error estimates are also proved and some examples offered. (8 refs.)

118401 Optimal shape of a reinforced column built up at a random rate. V.B.Kolmanovskii, V.V.Metlov.
Mech. Solids (USA), vol.18, no.1, p.83-93 (1983). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.18, no.1, p.91-101 (1983).
Considers the problem of optimizing the shape of a reinforced column that is erected at a random rate. The material of the column possesses properties of creep and nonuniform aging. The authors establish formulas in the general case that yield a solution of the problem in parametric form. For a number of characteristic situations, the authors obtain the optimal shape of the column numerically. It is established that the optimal shape depends strongly on the rate of erection. The authors analyze the relationship between the optimal shapes for deterministic and random rates of erection. (10 refs.)

118402 Optimal design of rigid-plastic beams of stepwise-constant height under impulsive loading. Yu.R.Lepik.
Mech. Solids (USA), vol.18, no.1, p.128-34 (1983). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.18, no.1, p.136-42 (1983).
The author investigates a beam with freely supported ends, derives the equations of motion and develops a procedure for solving them. The procedure allows one to take account of the motion of plastic hinges. The results are compared with those obtained by Martin and Symonds (1966) using the method of modal motions. (14 refs.)

118403 Stress-strain state of orthotropic multilayer shells. A.N.Ul'yashina.
Mech. Solids (USA), vol.18, no.1, p.146-55 (1983). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.18, no.1, p.155-66 (1983).
Proposes a version of the theory of inhomogeneous orthotropic shells that takes account of all transverse components of the deformation. A distinctive feature of this version is the kinematic model which defines the distribution of the displacements over the thickness in terms of the unknown displacements and stresses on some initial surface, and that yields the resolved system in mixed form. The solution of this system identically satisfies all the initial three-dimensional equations except for the elasticity relations for the transverse stresses (ignored in the classical theory), which are satisfied only on the initial surface. (9 refs.)

118404 On the equations of elastodynamics of bar mechanisms. M.Buculei.
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.3, p.255-60 (May-June 1983). In French. [received: Sept. 1983]
Starting from the kinematics and kinetics of linear-elastic solids in roto-translative movement, the equations of motion are given in integral form. By means of the Cauchy-Helmholtz equations and taking account of the compactness of the elastic solid a relation for the field of velocities is deduced. Finally an algorithm of elastodynamic analysis of bar mechanisms is given. (9 refs.) *J.S.*

118405 A free boundary value problem in plate theory. P.Villaggio (Istituto di Sci. delle Costruzioni, Univ. di Pisa, Pisa, Italy).
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.2, p.297-302 (June 1983).
Studies the equilibrium configuration of a thin rectangular plate, supported on an elastic foundation that reacts in compression only. It is assumed that the foundation is described by the Winkler model in the contact region. The plate is supposed to be weightless and subjected to a concentrated load in its midpoint. The shape of the free boundary, where the plate loses contact with the foundation, is determined. (6 refs.)

46.30 MECHANICS OF SOLIDS AND RHEOLOGY

(see also 62.20 Mechanical properties of solids, as related to microscopic structure)

118406 On the relationship between a dimensional and a thermodynamic peculiarity of the power law constitutive equation. G.Astarita.
J. Non-Newtonian Fluid Mech. (Netherlands), vol.13, no.2, p.223-4 (Sept. 1983).
The author published a paper in 1977 where it was shown that the power-law constitutive equation is a somewhat special case in a thermodynamic sense. The point is as follows. For all purely viscous fluids where the stress is given by an equation of the form $\tau=f(\alpha)D$, where $\alpha=\mathrm{Tr}(D^2)$, a variational principle of the Helmholtz-Korteweg type can be constructed. However, only for power-law fluids (including Newtonian ones) the quantity H to be minimized is proportional to the total rate of energy dissipation Δ (or of entropy production Δ/T). In fact the variational principle has no thermodynamic content whatsoever, and the proportionality of H and Δ for power-law fluids is fortuitous. The power-law constitutive equation is dimensionally special. In fact, only power-law fluids are endowed with only one dimensional rheological parameter, viz. the consistency K. All other fluids have two dimensional parameters, say a characteristic stress τ_0 and a characteristic shear rate γ_0. In the 1977 paper, it was suggested that the two peculiarities are perhaps related to each other. The purpose of the communication is to show that such is indeed the case. (1 ref.)

118407 Upper-bound analysis of hot extrusion of axisymmetric rods and tubes. I. Mathematical modelling of hot extrusion. C.Teodosiu, I.Rosu, T.Dumitrescu (Inst. for the Phys. & Technol. of Materials, Bucharest, Rumania).
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.3, p.317-41 (May-June 1983). [received: Sept. 1983]
Accurate evaluations of the extrusion pressure and of its dependence on technological parameters such as extrusion ratio, semicone die angle, ram speed, and coefficients of friction, are of great practical interest, since they allow the elaboration and/or the optimization of new technologies without resorting to expensive experiments on industrial scale. Moreover, by adopting a mathematical model close to the real process, it becomes possible to evaluate the variation of the stresses, strains, strain rates, and temperatures throughout the process. Finally, a reliable model permits the laboratory simulation, e.g. by hot torsion tests, of the real deformation process, thus providing a rather simple means for the experimental comparison of various technological schemes. (10 refs.)

118408 Stresses in a semi-infinite body having a semi-spherical pit under uniaxial tension. T.Fujita (Dept. of Appl. Phys., Nat. Defense Acad., Yokosuka, Japan), E.Tsuchida, I.Nakahara.
Sci. & Eng. Rep. Natl. Def. Acad. (Jpn.) (Japan), vol.20, no.3, p.265-80 (Nov. 1982). In Japanese. [received: Aug. 1983]
The authors present an asymmetric solution for the stress distributions around a hemispherical pit at a plane surface of a semi-inifinite body under uniaxial tension. In the analysis, eight stress functions are chosen so as to fulfil the boundary conditions automatically, both at the plane surface and at infinity. On the other hand, the remaining boundary conditions at the surface of the pit are satisfied with the aid of the 'half-range expansion' technique. Numerical results are given for the variations around the pit and along the z-axis and compared with the corresponding results under biaxial tension. (13 refs.)

118409 Use of coefficients of influence to solve some inverse problems in plane elasticity. A.J.Durelli (Dept. of Mech. Engng., Univ. of Maryland, College Park, MD, USA), D.Wu.
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.2, p.288-96 (June 1983).
The principle of superposition of the order of isochromatic fringes and the concept of the coefficient of influence of the order of those fringes are introduced. The method is proposed to solve some inverse problems in elasticity and is applied to the determination of the forces that act at the points of contact between disks loaded in their plane. For this purpose Michell equations are used to determine the stresses at selected points of a disk and the coefficients of influence are computed numerically. The method can be generalized to other plane bodies loaded in the plane and if no theoretical solution is available the problem could be solved completely experimentally. The application presented is related to a study of discrete, or granular, media. (7 refs.)

46.30C Static elasticity

118410 Bifurcation of an elastic slab having inclined anisotropy-axes under axial loads. M.Kurashige (Dept. of Mech. Engng., Tohoku Univ., Sendai, Japan).
Bull. JSME (Japan), vol.26, no.216, p.954-7 (June 1983).
Bifurcations from a homogeneous, finite, stretch-shear-combined deformation are studied for a transversely isotropic, compressible, elastic slab having inclined anisotropy-axes which is subjected to uniform axial loads, tensile and compressive. The bifurcations are analyzed on the basis of the incremental deformation theory. For various wavelength-to-thickness ratios, the critical loads are shown in the form of curves as a function of anisotropy-axis inclination. (13 refs.)

118411 Nonlinear stress analysis of offshore pipelines during pickup operations. K.A.Ansari (Mech. Engng., Univ. of Petroleum & Minerals, Dhahran, Saudi Arabia).
Comput. & Struct. (GB), vol.18, no.2, p.357-63 (1984).
Presents a method of analyzing the stresses in a submarine pipeline as it is picked up off the sea floor by barge davits. A nonlinear large-deflection analysis is used and the pipeline is modeled as a series of finite beam segments from the ocean bottom on up. The governing equations are derived and the pipeline configuration satisfying known boundary conditions is determined by an initial-value approach using an iterative-type technique. Boundary conditions at the mudline are identified by modeling the pipeline resting on the ocean bed as a semiinfinite tensioned beam on an elastic foundation. The effects of a nonlinear stress-strain curve for the pipe material are included and both Ramberg-Osgood and Hutchinson formulations are considered. With the technique suggested, any given pickup procedure can be analyzed or a reliable procedure can be developed based on a given, allowable pipe stress level and any desired improvement in the final configuration and/or stress levels may be achieved by a variation of the parameters involved. A practical example is examined to demonstrate the applicability of the analysis presented, which should provide a useful tool in either judging or developing a pickup procedure. (10 refs.)

118412 Numerical optimum design of elastic annular plates with respect to buckling. K.Rzegogcinska-Pelech, Z.Waszczyszyn (Tech. Univ. of Kracow, Krakow, Poland).
Comput. & Struct. (GB), vol.18, no.2, p.369-78 (1984).
Annular plates of fixed volume, under uniform radial edge compression are considered. The plate is divided into N segments of linearly variable or constant thickness. Geometrical constraints for the segment thickness and for the effective stress are assumed. Two types of objective functions are explored: (I) maximum value of critical load at the fixed number of circumferential buckling half-waves j, (II) unimodal optimum design for such a number j that buckling load equals max $(\inf_j|P^j|)$. The shooting method is applied to compute the distribution of axial forces in the prebuckling state and the basic buckling load for the plate of variable thickness. The optimal distribution of segment thicknesses χ_k for $k=1, ..., N$ are computed by means of Rosenbrock's method with internal penalty function. Results of numerical analysis are reported for both the optimum design problems I and II. (7 refs.)

118413 A study on GRP skin/foam core sandwich structures. S.K.Malhotra, B.J.C.Babu (FRP Res. Centre, Indian Inst. of Technol., Madras, India).
Composites (GB), vol.14, no.4, p.383-6 (Oct. 1983).
Presents a simple graphical procedure which allows a structural sandwich beam or panel to be designed from GRP skin and foam core materials, so that the weight of the sandwich is a minimum. The method is based upon the well-known equations for bending rigidity, bending moment and weight of a sandwich beam. (2 refs.)

118414 Thermoelastic equations for thick walled shells. M.M.Belyaev, V.I.Zavelion, O.A.Ryadno.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.9, p.21-3 (1983). In Ukrainian.
A method is suggested for studying the heat-stressed state of thick-walled shells with a median surface of an unknown shape. The results obtained from solution of test problems are in agreement with exact solutions within the errors admissible in engineering practice. (6 refs.)

118415 Note on shear interaction between two fibers. S.B.Batdorf (Dept. of Materials Sci. & Engng., Univ. of California, Los Angeles, CA, USA).
Eng. Fract. Mech. (GB), vol.18, no.6, p.1207-10 (1983).
The shear lag approximation for stress distributions in damaged composites employed by Hedgepeth and Van Dyke (see J. Composite Mater, vol.1, p.294, 1967) and later by others, employs an effective shear stiffness, Gh to describe the role of the matrix in transferring direct stress from a fiber to a neighboring fiber. In their treatment it was assumed that the force per unit length transferred between fibers 1 and 2 is given by $F'=A_f(d\sigma/d_3)=Gh(w_2-w\omega_1)/d$, where A_f is fiber area, σ is fiber stress, G is the matrix shear modulus, d is distance between fiber centers, and w_2-w_1 is the relative axial displacement. Shear lag was originally devised as a technique for obtaining stress distributions in aircraft sheet-stiffener combinations. In that context d is the distance between rivet lines and h is sheet thickness. In extending the analysis to a 3D composite d remains well-defined, but loses physical significance, since $(w_2-w_1)/d$ no longer serves as a direct measure of shear strain. But h is undefined, and loses physical significance as well. The present authors give an exact analytical treatment of h for limiting case of a single pair of fibers. (9 refs.)

118416 Torsion of elastic space with cylindrical cavity and ring cut. M.A.Kerimov.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.1, p.137-40 (1983). In Russian.
The problem of the torsion of an elastic space with a cylindrical cavity and a ring cut with perforations is examined. By a method of dual integral equations this problem is reduced to Fredholm integral equations of the second kind. An asymptotic solution is found in case of a deep cut. (5 refs.)

118417 Shear-band bifurcation of an isotropic compressible hyperelastic solid. M.Kurashige (Dept. of Mech. Engng. II, Faculty of Engng., Tohoku Univ., Sendai, Japan).
J. Elasticity (Netherlands), vol.13, no.3, p.243-56 (1983).
Concerns shear-band bifurcations from the homogeneous finite plane deformation of an isotropic compressible hyperelastic solid. The governing equations for the incremental plane deformation superposed on the initial finite deformation are derived and then the equilibrium equations in terms of incremental displacements are classified into the elliptic type, parabolic type, etc. From this classification follows a restriction which should be placed on the strain-energy function in order that the equilibrium equations may be either elliptic or parabolic for all principal stretches. For the hyperelastic solid complying with this restriction, the condition for the shear-band bifurcation is obtained. Finally, the incremental displacement field of an infinite series of shear bands in a slab sandwiched between slippery rigid layers is established. (11 refs.)

118418 A note on bi-orthogonality relations for elastic cylinders of general cross section. R.D.Gregory (Dept. of Materials, Univ. of Manchester, Manchester, England).
J. Elasticity (Netherlands), vol.13, no.3, p.351-5 (1983).
The bi-orthogonality relation satisfied by the elastodynamic (or elastostatic) eigenfunctions of a cylindrical rod of general cross section is obtained by a simple argument. The relation is shown to depend only upon (i) the elastic reciprocal theorem, and (ii) the elastic symmetry of the cylinder in planes perpendicular to its generators. (11 refs.)

118419 Calculation of the elastic characteristics of a unidirectional fiber composite by the cross-section method. S.S.Abramchuk, I.P.Dimitrienko, V.N.Kiselev.
Mech. Compos. Mater. (USA), vol.18, no.6, p.641-7 (Nov.-Dec. 1983). Translation of: *Mekh. Kompozitnykh Mater. (USSR)*, vol.18, no.6, p.970-6 (Nov.-Dec. 1982). [received: Sept. 1983]
Relationships have been derived for the calculation of the elastic characteristics of a unidirectional composite with anisotropic components by the cross-section method. It has been shown that the successive application of the cross-section method leads to breakdown of the symmetry of the elastic properties of an individual element. Averaging of the elastic characteristics obtained for individual elements over the nodes in the 2-3 plane permits the bringing of the computational results closer to the properties of actual composites. The computational results were in satisfactory agreement with the experimental data. (8 refs.)

118420 Quasi-static problem of the mechanics of a deformable solid in the stresses. B.E.Pobedrya, T.Kholmatov.
Mech. Solids (USA), vol.17, no.6, p.49-52 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.6, p.55-8 (1982). [received: Oct. 1983]
A new formulation (including a variational formulation) is offered to the quasi-static problem of nonlinear mechanics of a deformable solid in the stresses, which involves the solution of six equations for the six independent components of the symmetrical stress tensor while satisfying six boundary conditions. For an isotropic elastic medium it is established that the 'energy functional' is positive-definite. It is demonstrated that the problem in question is elliptic. (6 refs.)

118421 Stressed state of a strip with one or two elastically reinforced circular holes. N.I.Mironenko.
Mech. Solids (USA), vol.17, no.6, p.66-72 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.6, p.73-80 (1982). [received: Oct. 1983]
Investigates the stressed state of a strip with one or two circular holes reinforced by elastic rings. A numerical analysis is offered for two cases, in which the reinforcing rings are 'stiffer' or 'softer' than the strip. (6 refs.)

118422 On the determination of the three-dimensional stressed state of sandwich plates with transverse-isotropic layers. V.A.Galich, V.A.Shaldyrvan.
Mech. Solids (USA), vol.17, no.6, p.119-22 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.6, p.131-4 (1982). [received: Oct. 1983]
On the basis of Vorovich's semi-inverse method (1970), the authors construct and investigate some properties of homogeneous solutions in the problem of extension-compression of a sandwich plate of symmetrical structure with transtropic layers. Using projection methods, they consider the problem of passage in the limit from the three-dimensional to the two-dimensional problem, and formulate boundary-value problems for multiply connected bodies of finite size. (7 refs.)

118423 Bending of a reticular plate with allowance for transverse shear deformation. G.I.Pshenishnov, E.D.Tagi-Zade.
Mech. Solids (USA), vol.17, no.6, p.131-4 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.6, p.143-7 (1982). [received: Oct. 1983]
Considers the transverse bending of a rectangular plate consisting of a large number of rigidly coupled rods whose axes lie on a plane called the center plane. One of the principal central axes of the cross section of each rod of the plate belongs to its center plane. It is also assumed that all the rods of the plate can be divided into a series of families, each of which is characterized by the fact that the axes of its rods form a family of close-lying smooth nonintersecting curves on the center plane. The number n of such families is arbitrary but is greater than 1. A solution of the problem is obtained on the basis of a continual theoretical model. It is shown that, if the torsional stiffness of the rods can be disregarded, calculations for a plate with a rhombic lattice reduce to calculations for a plate with a square lattice. Some numerical results are given. (1 ref.)

118424 Singular integral equations in micropolar thermoelasticity. I.Craciun, A.Craciun (Dept. of Maths., Polytech. Inst. of Iasi, Iasi, Rumania).
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.4, p.347-56 (July-Aug. 1983).
The linear theory of micropolar thermoelasticity in the case of stationary vibrations for an isotropic, homogeneous and centrosymmetric solid is considered. There are formulated two boundary value problems of this theory. After the introduction of two surface micropolar thermoelastic potentials, the boundary value problems are considered reduced to singular integral equations. (15 refs.)

118425 Non-simple quasi-static thermoelastic deflection of a thin clamped circular plate. A.K.Dhar (Dept. of Maths., Jadavpur Univ., Calcutta, India).
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.4, p.431-7 (July-Aug. 1983).
A non-simple quasi-static thermoelastic deflection of a thin clamped plate due to a Ramp-type heating on the upper surface of a concentric circular region has been found out. The Laplace transform has been used to solve the problem. Finally, thermal normal deflection has been found out in terms of infinite series. (10 refs.)

118426 Dynamic stress concentration around a circular hole in an infinite elastic strip. S.Itou (Dept. of Mech. Engng. & Energy, Hachinohe Inst. of Technol., Hachinohe, Japan).
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.1, p.57-62 (March 1983). [received: Oct. 1983]
Transient response of an infinite elastic strip with a circular hole is investigated. A normal stress is suddenly applied and maintained at the hole. The boundary condition equations are satisfied in the Laplace transformed domain. A numerical Laplace inversion technique is then used to recover the time dependence of the solution. (8 refs.)

118427 The effect of a normal shock on the aeroelastic stability of a panel. M.H.Williams (School of Aeronautics & Astronautics, Purdue Univ., West Lafayette, IN, USA).
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.2, p.275-82 (June 1983).
The effect of a standing shock wave on the static and dynamic aeroelastic stability of a flexible panel is investigated using a linear structural and aerodynamic theoretical model. It is found that the shock is generally stabilizing. The lowest critical dynamic pressures are associated with shock positions downstream from the panel, where the panel is uninfluenced by the shock. 46.30J Viscoelasticity, plasticity, viscoplasticity, creep, and stress relaxation

(inc. rheology of solids)

118428 Visco-plastic large deformation analysis by finite element method and its applications. Inextensional deformation of thin-walled square tube. K.Murase, H.Katori, T.Nishimura (Meijo Univ., Nagoya, Japan).
Bull. JSME (Japan), vol.26, no.216, p.923-9 (June 1983).
Treats a problem of inextensional deformation collapse of a thin-walled square tube under axial compressive impulsive load. The analytical method is based on visco-plastic large deformation analysis involving material and geometrical nonlinearity. The results of calculation are compared with the experimental ones, and the dynamic characteristics of the thin-walled square tube are discussed. (11 refs.)

118429 Estimation of stress and strain at the notch root in the elastic-plastic range using the J-integral. N.Miki (Faculty of Engng., Ehime Univ., Ehime, Japan), K.Ogura, K.Ohji.
Bull. JSME (Japan), vol.26, no.216, p.930-7 (June 1983).
An elastic-plastic analysis of notched plates was made. The J-integral of the notched plates was computed, and the relations between the value of J-integral and the stress and strain at the notch root were discussed. It was found that a master-curve representation of the stress σ or the strain ϵ at the notch root was possible on a σ/σ_Y(or ϵ/ϵ_Y)-J/J_{yield} diagram (σ_Y:yield stress, ϵ_Y:yield strain, J_{yield}:the J-integral value at which notch root yielding starts). The J-integral was found to be aproximately given as $J=J_{\text{linear}}$(=elastic J-integral) when $P/P_{GY}\leq 1$, regardless of the stress condition, the elastic stress concentration factor K_t and the strain hardening characteristics of the material (P:the applied load, P_{GY}:the gross yield load of the respective notched plate). By combining these two findings, a simple method was proposed to estimate the stress and strain at the notch root in the elastic-plastic range up to gross yielding. (8 refs.)

118430 A finite element method for elastic-plastic beams and columns at large deflections. C.Chebl, K.W.Neale (Dept. of Civil Engng., Univ. de Sherbrooke, Sherbrooke, Quebec, Canada).
Comput. & Struct. (GB), vol.18, no.2, p.255-61 (1984).
A finite element scheme for the large-displacement analysis of elastic-plastic beams and columns is presented. The proposed method, which assures continuous deflections and continuous slopes at the element junctions, is shown to furnish fairly accurate results with a minimum number of elements. Comparisons are made with existing results for laterally loaded beams on elastic foundations and for elastic columns on bi-linear elastoplastic foundations. The effect of imperfections on the buckling of elastic-plastic columns is also investigated. (8 refs.)

118431 A three-dimensional nonlinear analysis of cross-ply rectangular composite plates. T.Kuppusamy, J.N.Reddy (Virginia Polytech. Inst. & State Univ., Blacksburg, VA, USA).
Comput. & Struct. (GB), vol.18, no.2, p.263-72 (1984).
The results of a three-dimensional geometrically nonlinear, finite-element analysis of the bending of cross-ply laminated anisotropic composite plates are presented. Individual laminae are assumed to be homogeneous, orthotropic and linearly elastic. A fully three-dimensional isoparametric finite element with eight nodes (i.e. linear element) and 24 degress of freedom (three displacement components per node) is used to model the laminated plate. The finite element results of the linear analysis are found to agree very well with the exact solutions of cross-ply laminated rectangular plates under sinusoidal loading. The finite element results of the three-dimensional, geometrically nonlinear analysis are compared with those obtained by using a shear deformable, geometrical nonlinear, plate theory. It is found that the deflections predicted by the shear deformable plate theory are in fair agreement with those predicted by three-dimensional elasticity theory; however stresses were found to be not in good agreement. (21 refs.)

118432 Effect of shear deformation on the yielding of circular plates. G.J.Turvey (Dept. of Engng., Univ. of Lancaster, Lancaster, England).
Comput. & Struct. (GB), vol.18, no.2, p.307-10 (1984).
Shear Deformation Plate Theory (SDPT) is used to analyse the first yield response of axisymmetric circular plates. Expressions for the first yield pressure and the associated plate centre deflection of uniformly loaded, simply supported and clamped plates are presented. corresponding Classical Thin Plate Theory (CPT) expressions are also deduced. It is demonstrated that the SDPT and CPT expressions are related via correction factors which are functions of the plate thickness-ratio β, and Poisson's ratio. Graphs of the correction factors plotted against β are presented. They illustrate that inherent shear flexibility causes a slight reduction in the first yield pressure compared with the CPT value when the plate edges are simply supported and a slight increase when they are clamped. Plate centre deflections are, however, increased significantly for both support conditions. (6 refs.)

118433 A curvilinear triangular finite element for plate bending by a hybrid method of assumed displacements supplemented with assumed stresses. L.S.D.Morley (Structures Dept., Royal Aircraft Establ., Farnborough, England).
Comput. & Struct. (GB), vol.18, no.2, p.311-18 (1984).
A curvilinear triangular finite element is described for plate bending problems. The geometry is in quadratic parametric representation. The method employs assumed displacements supplemented with assumed stresses and is embedded in Kirchhoff theory. The curvilinear finite element is designed to pass exactly the patch test for constant curvature changes when the flexural rigidity is constant. Rigid body movements are always exactly recovered. Numerical evidence is provided on patch tests for linearly varying curvature changes. (4 refs.)

118434 Generalised problem of thermoviscoelasticity of a layer under the action of a time-random stress-thermal field. L.K.Shelyag.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.9, p.13-17 (1983). In Ukrainian.
Basic probability characteristics of a thermoviscoelastic field resulting in a viscoelastic homogeneous layer from the effect of a time-random stress-thermal field are plotted in terms of the correlation theory. (5 refs.)

118435 Creep of thin shells interacting with rigid bodies. G.I.L'vov.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.9, p.24-6 (1983). In Ukrainian.
A variational statement is suggested for the contact problem of unsteady-state creep of thin shells interacting with rigid bodies. The existence and uniqueness of a local solution are proved on the basis of the theory of variational inequalities. (6 refs.)

118436 Rate sensitivity of plastic flow and implications for yield-surface vertices. J.Pan (Stress Analysis & Fracture Section, Batelle Columbus Labs., Columbus, OH, USA), J.R.Rice.
Int. J. Solids & Struct. (GB), vol.19, no.11, p.973-87 (1983).
When crystalline slip is considered as the micromechanism of plastic deformation in polycrystals and the slip process is assumed to be rate-independent, the formation of a vertex is predicted on the current yield surface in stress-space. Experiments which were conducted to confirm the existence of such a vertex are known to have produced ambiguous results: e.g. a superimposed shear during compressive loading was found to produce an initially elastic response. If one considers that the crystalline slip process is slightly rate-dependent, however, then one can furnish a reasonable explanation for this elastic behaviour in shear. The authors illustrate the point by considering first a single crystal model undergoing double slip, and then a polycrystal model based on the slip concepts of Batdorf and Budiansky.The results presented, based on the assumption that the slip process is not rate-independent, but rather at least slightly rate-dependent, give agreement, and reasonable quantitative agreement, to experimenal results for superposed shear during compressive loading. They also suggest that the actual rate sensitivity of plastic flow may be central to understanding the ambiguous conclusions from experimental attempts to fine yield surface vertices. (21 refs.)

118437 The plastic η factor for a deeply cracked beam with tension of the small remaining ligament. E.Smith (Metall. Dept., Univ. of Manchester Inst. of Sci. & Technol., Manchester, England).
Int. J. Fract. (Netherlands), vol.23, no.1, p.R23-7 (Sept. 1983).
The η factor relates the J integral to the work per unit uncracked ligament area when a cracked body is loaded. Thus if the displacement is separated into elastic and plastic components δ_{EL} and δ_{PL}, and the J integral into elastic and plastic components J_{EL} and J_{PL}, while the elastic work W_{EL} is defined as the work recovered during linear elastic unloading (with the crack length fixed) from any point on an elastic-plastic load-displacement record, the elastic η factor η_{EL} is defined by the relation $J_{EL}=\eta_{EL}W_{EL}/2BL$, where 2L and B are respectively the length and thickness of the uncracked ligament. The plastic η factor η_{pL} is defined in a manner consistent with its elastic counterpart: $J_{PL}=\eta_{PL}W_{EL}/2BL$. (5 refs.)

118438 Hydraulic impact in circular visco-elastic shells. T.A.Nasibov.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.1, p.129-36 (1983). In Russian.
The phenomenon of the hydraulic impacts in circular visco-elastic shells with an ideal liquid is investigate. With the help of Laplace transformations a solution of the problem is found. (7 refs.)

118439 The investigation of the behaviour of an elastic-plastic thick-walled tube under irradiation. A.S.Gulgazli, D.I.Isaev.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.1, p.141-4 (1983). In Russian.
The problem of the strength of an elastic-plastic thick-walled tube undergoing neutron radiation is considered. It is calculated that the limit of fluidity is a function of radiation dose. The plastic characteristics of the material constant. The expression for the stress both in elastic and plastic zones is obtained. (4 refs.)

118440 Use of nonlinear models of viscoelasticity in the investigation of the effect of hydrostatic pressure on the shear creep of polymeric materials. A.Ya.Gol'dman, G.Kh.Murzakhanov, N.P.Demenchuk ('Plastopolimer' Okhtinsk Sci.-Industrial Assoc., Leningrad, USSR).
Mech. Compos. Mater. (USA), vol.18, no.6, p.637-40 (Nov.-Dec. 1983). Translation of: *Mekh. Kompozitnykh Mater. (USSR)*, vol.18, no.6, p.965-9 (Nov.-Dec. 1982). [received: Sept. 1983]
Two nonlinear models are presented which provide a sufficiently accurate description of the shear creep under an imposed hydrostatic pressure which increases monotonically at a constant rate. (7 refs.)

118441 Compression failure of a unidirectional fibrous composite with an elastoplastic matrix. A.N.Guz', M.A.Cherevko (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).
Mech. Compos. Mater. (USA), vol.18, no.6, p.656-63 (Nov.-Dec. 1983). Translation of: *Mekh. Kompozitnykh Mater. (USSR)*, vol.18, no.6, p.987-94 (Nov.-Dec. 1982). [received: Sept. 1983]
It is concluded that drawing upon the three-dimensional linearized theory of stability to solve problems of the compression failure of unidirectional fibrous composite materials with an elastoplastic matrix is effective and makes it possible to predict sufficiently accurately the breaking loads. (16 refs.)

118442 Statistical theory of fibrous media. I. Longitudinal shear. G.A.Vanin (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).
Mech. Compos. Mater. (USA), vol.18, no.6, p.704-10 (Nov.-Dec. 1983). Translation of: *Mekh. Kompozitnykh Mater. (USSR)*, vol.18, no.6, p.1043-50 (Nov.-Dec. 1982). [received: Sept. 1983]
A statistical theory of fibrous material is presented which relates their physical, mechanical, and strength characteristics to the properties of the components with consideration of the manufacturing technology parameters—scatter in the properties and geometry of the fibers and matrix, distributed imperfections in the phases of the medium and at the phase boundaries, stacking faults of the material, and others. (10 refs.)

118443 Conservation laws for an elastic-viscoplastic medium with finite deformations. V.I.Kondaurov.
Mech. Solids (USA), vol.17, no.6, p.91-101 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.6, p.100-11 (1982). [received: Oct. 1983]
Investigates the general equations of the theory of flow of a finite-deformed elastic-plastic medium with dynamic hardening. A new kinematic equation, is proposed in the form of a conservation law, that links the velocity of the total-displacement gradient with the gradients of the particle velocities. This form of the equation makes it possible to write the complete system of equations in the form of a system of conservation laws in arbitrary curvilinear moving coordinates. It is shown that, in contrast to the case considered, the equations of flow theory for a plastic solid that is insensitive to the deformation rate are incapable in principle of being reduced to divergent form. The characteristic properties of the system are investigated in the adiabatic approximation. A symmetrization of the equations is offered and sufficient hyperbolicity conditions formulated. Without introducing any additional assumptions, a closed system of relations on strong discontinuities is written. The authors consider the existence and uniqueness conditions for the solution of the problem of calculating the quantities behind a shock-wave front when the state ahead of the front is known and the wave velocity is specified. (8 refs.)

118444 Mixed variational principle of creep theory in problems of long-term strength. M.V.Sergeev.
Mech. Solids (USA), vol.17, no.6, p.102-6 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.6, p.112-16 (1982). [received: Oct. 1983]
A modification of the mixed variation principle of creep theory is proposed in relation to problems of long-term strength, such that it is possible to take account of accumulation of damage to the material within the framework of one functional. (12 refs.)

118445 Deformation of materials with defects. A.V.Berezin.
Mech. Solids (USA), vol.17, no.6, p.113-18 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.6, p.124-30 (1982). [received: Oct. 1983]
Formation of defects in the body, as well as changes in the size of the defects under load, causes the body to have differing deformation characteristics in different stressed states. This fact has previously been confirmed experimentally for the case of deformation of porous materials. The present author establishes a relationship between the deformation characteristics and the growth conditions for microdefects in various stressed states. A plastic body is considered whose deformation involves formation and change in size of microcracks. It is assumed that when the stress-strain state achieves the conditions for initiation of microcracks in the slip system there appear k_0 defects of size R_0 per unit area; under subsequent deformation the intact part of the slip plane is shear-deformed, the magnitude of the shear depending only on the defective tangential stress which is larger than its preceding values; the change in the size of the microcracks is determined by their growth condition. (17 refs.)

118446 Solutions of singular problems of torsion of an elastic/ideally plastic rod. A.M.Protsenko.
Mech. Solids (USA), vol.18, no.1, p.94-8 (1983). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.18, no.1, p.102-6 (1983).
Looks at the problem of torsion of a rod whose cross section contains the vertex of a re-entrant angle. The author proves the existence of singular fields of the self-stresses and, as a result, that the stress field is regular for the plasticity problem. Discusses methods of solving such problems and some results of their implementation, using the example of the finite-element method. (4 refs.)

118447 Analysis of shear lag in cylindrical tubes of arbitrary cross section. W.H.Wittrick (Dept. of Civil Engng., Univ. of Birmingham, Birmingham, England).
Proc. R. Soc. London Ser. A (GB), vol.389, no.1797, p.259-77 (8 Oct. 1983).
A very general analysis is given of the phenomenon of shear lag in thin-walled cylindrical tubes, with single-cell cross sections of arbitrary shape, containing any number of concentrated longitudinal booms that carry direct stress only, and subjected to any longitudinal distribution of bending moment and torque. Two equations relating the distributions of direct and shearing stresses on the cross section are derived for the most general case where the tube is non-uniform because of an arbitrary longitudinal variation of wall thicknesses and boom areas. These equations, which are remarkably simple in view of their generality, incorporate all the requirements of equilibrium and compatibility and provide corrections to the stresses, curvature and twist calculated from the engineers' theory of bending and torsion. They also govern the distribution of stresses arising from the application of self-equilibrating systems of tractions to the end cross sections. Exact solutions are obtained for the case of a uniform, but otherwise arbitrary, cross section under any polynomial distribution of bending moment and torque, and it is shown how conditions at the end cross sections can be satisfied with the aid of solutions of a simple eigenvalue problem. (5 refs.)

118448 Stress couple concentrations for cylindrically bent plates with circular holes or rigid inclusions. E.Reissner (Dept. of Appl. Mech. & Engng. Sci., Univ. of California, San Diego, La Jolla, CA, USA).
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.1, p.85-7 (March 1983). [received: Oct. 1983]
The authors obtain explicit solutions for the two problems considered, in terms of Poisson's ratio ν and in terms of a parameter μ which is of the order of the ratio of hole radius a to plate thickness h, through application of a sixth-order theory of shear deformable plates, with this solution involving distinct edge zone and interior solution contributions when $1 \ll \mu$. It is shown that in this range some relevant asymptotic Bessel function formulas furnish explicit examples concerning the distinction between first-order shear corrections and second-order (Timoshenko-type) shear corrections which have been established in a recent general analysis. 46.30L Static buckling and instability

118449 Elasto-plastic buckling of stiffener plates in beam-to-column flange connections. H.A.El-Ghazaly, R.N.Dubey, A.N.Sherbourne (Univ. of Waterloo, Waterloo, Canada).
Comput. & Struct. (GB), vol.18, no.2, p.201-13 (1984).
The problem of plastic buckling of steel plates is reviewed in relation to the load carrying capacity of stiffener plates in beam-to-column flange connections. Due to the nonuniformity of the stress distribution in these plates, the finite element method is used to compute the stresses in the elastic and plastic ranges. A bifurcation analysis is performed using both flow and deformation theory to evaluate the elasto-plastic buckling of the stiffener. A scaled inverse interactive version of the power method is employed to evaluate the bifurcation load. A parametric study is conducted on stiffeners and design curves are obtained showing the relationship between the critical stress and the slenderness ratio for different plate aspect ratios. (38 refs.)

118450 A modification of Potter's method for diagonal matrices with common unknown. I.Sheinman, G.J.Simitses (School of Engng. Sci. & Mech., Georgia Inst. of Technol., Atlanta, GA, USA).
Comput. & Struct. (GB), vol.18, no.2, p.273-5 (1984).
A solution methodology is presented for large systems of linear algebraic equations. In matrix form the submatrices are grouped along the diagonal (with at most three submatrices of varying order), except that there exists one nonvanishing column of submatrices. The algorithm is a modification of Potter's method and it is especially applicable to nonlinear buckling problems (limit-point instability). (5 refs.)

118451 Post buckling behaviour of transverse cracked columns. N.Anifantis, A.Dimarogonas (Machine Design Lab., Univ. of Patras, Patras, Greece).
Comput. & Struct. (GB), vol.18, no.2, p.351-6 (1984).
Post buckling behaviour of a column with a transverse surface crack on the one side is studied, considering the local flexibility because of the crack. This

flexibility, also called compliance is known to be related to the stress intensity factor. This relation is generalized and expressed in the form of a complete local stiffness matrix of the cracked section of the beam. The Paris equation for the deflection of cracked members is extended for this purpose to give the generalized influence coefficients, being considered as incremental deflections because of the presence of the crack. Eigenvalue solutions for the buckling load are developed which do not differ for appreciably slender columns from known solutions based on some only of the local flexibility coefficients reported in the literature. Moreover, two distinct buckling modes have been identified to closing cracks, because of the different behavior of the cracked region in compression and tension or positive and negative bending modes. The post buckling behavior has been studied, for both buckling modes solving numerically the nonlinear equation for the elastica with the local flexibilities because of the crack. (14 refs.)

118452 On stability of core-filled cylindrical shells under uniform external pressure. R.M.Bergman, A.E.Sapozhnikov.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.1, p.58-63 (1983). In Russian.
The stability of a thin elastic closed cylindrical shell containing an elastic isotropic core under uniform external pressure was considered by a method of asymptotical analysis. The hinge boundary conditions for the shell and core were assumed. The shell stiffness as compared with the core stiffness and large-wave number in the direction of the shell guide were assumed to be much greater and very large correspondingly. The formulas derived in this article can be used to find critical forces. (6 refs.)

118453 Stability and optimization of viscoelastic cylindrical shells made out of composites under combined loading. V.Yu.Siryus, G.A.Teters (Inst. of Polymer Mech., Acad. of Sci., Riga, Latvian SSR).
Mech. Compos. Mater. (USA), vol.18, no.6, p.685-91 (Nov.-Dec. 1983). Translation of: *Mekh. Kompozitnykh Mater. (USSR)*, vol.18, no.6, p.1021-8 (Nov.-Dec. 1982). [received: Sept. 1983]
The numerical investigation of the functions describing the physical restrictions in the problem of the optimization of cylindrical shells made out of composites with a viscoelastic binder carried out has shown that the optimization problem considered belongs to the class of convex programming problems. The parameters of the optimal design of the shell, i.e. the mass G^* and the relative fractions of the reinforcements θ_1, θ_2, arranged according to the corresponding schemes, are substantially dependent on the time for which the construction is utilized τ_{op}. A comparison of the optimal designs of a shell at the same utilization times τ_{op} has shown that the use of three-dimensional reinforcement schemes with an insignificant gain in mass provides a gain in the volume of the reinforcement in comparison with the planar reinforcement schemes of 22 to 24%. (10 refs.)

118454 Torsional stability of elastic rods. N.V.Nanichuk, A.A.Barsuk.
Mech. Solids (USA), vol.17, no.6, p.135-41 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.6, p.148-54 (1982). [received: Oct. 1983]
Investigates the stability of elastic rods loaded at the ends by concentrated moments, and the effect of distributed stiffness characteristics on the magnitudes of the critical moments. Within the framework of the static approach, for rods with the same bending stiffnesses in different planes, the effect of variability of the distributions of the bending stiffnesses along the rods on the critical values of the twisting moments at which loss of stability occurs is investigated. The solution of problems of stability under conditions of clamping of the edges of the rods is reduced to calculation of quadratures and determination of the roots of a system of two reduced to calculation of quadratures and determination of the roots of a system of two transcendental equations. For symmetrical stiffness distributions (relative to the center of the rods), determination of the eigenvalues reduces to solution of one transcendental equation. Specific examples are given. (8 refs.)

118455 On the stability of linear stochastic systems with periodically nonstationary parametric excitation. V.A.Semenov, A.I.Smirnov.
Mech. Solids (USA), vol.18, no.1, p.14-20 (1983). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.18, no.1, p.16-23 (1983).
Investigates the structure and configuration of the stability regions of linear stochastic systems in the case in which parametric excitation is a periodically nonstationary random process. The parametric excitation is specified by a multiplicative or additive representation of a deterministic periodic function of time and of some stationary random function with rational spectral density. The boundaries of the stability regions are constructed by using the method of movement functions jointly with the numerical method of Bolotin for investigating the solutions of linear differential equations with periodic coefficients. (6 refs.)

118456 Geometrical theory of stability of shells. A.L.Gol'denveizer.
Mech. Solids (USA), vol.18, no.1, p.135-45 (1983). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.18, no.1, p.143-54 (1983).
Discusses the possible effect that pseudobendings of the center surface (i.e. deformations that generalize bending and are in a sense similar to them) exert on the asymptotic behavior of the upper and lower critical loads of a thin elastic shell. The author offers a comparison with the results obtained within the framework of Pogorelov's geometrical theory of shell stability (1966), which is based on allowance for the effect of bendings. (12 refs.)

118457 Buckling of a heated thin non-homogeneous annular circular plate of variable thickness. J.Mukhopadhyay (Bohar High School, Burdwan, India).
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.3, p.289-94 (May-June 1983). [received: Sept. 1983]
Deals with the buckling of a heated non-homogeneous annular circular plate of thickness varying as the *m*th power of the radial distance whereas Young's modulus varies as the *m*th power of the same. The general stability criterion has been obtained whence the critical buckling compression as well as the critical temperature have been calculated. (9 refs.)

118458 Buckling, postbuckling, and the flow through a tethered elastic cylinder under external pressure. C.Y.Wang (Depts. of Math. & Physiology, Michigan State Univ., East Lansing, MI, USA), L.T.Watson, M.P.Kamat.
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.1, p.13-18 (March 1983). [received: Oct. 1983]
A thin-walled elastic cylinder is tethered by numerous springs to an outer rigid cylinder. As external pressure is increased, the elastic cylinder will remain circular until a critical pressure difference is attained. The nonlinear governing equations for large deflections are formulated. The stability analysis shows the elastic cylinder may buckle with more than two circumferential waves due to the stiffness of the springs. Postbuckling shapes are integrated numerically by a quasiNewton method. The flow through such a partially collapsed shape is then computed by a finite element method. (16 refs.)

118459 Plastic buckling of initially imperfect stiffened cylinders in axial compression. G.A.Duffett, B.D.Reddy (Dept. of Civil Engng., Univ. of Cape Town, Rondebosch, S Africa).
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.1, p.88-94 (March 1983). [received: Oct. 1983]
The behavior in the plastic range of axially compressed stringer-stiffened cylinders is investigated. The shell under consideration is assumed to have an initial imperfection in the form of sinusoidal deviation both axially and circumferentially. The constitutive relation employed here is J_2 deformation theory of plasticity. This relation, as well as kinematic assumptions regarding the behaviour of the panels and stiffeners that constitute the stiffened shell, is used in the principle of virtual work to obtain a set of nonlinear algebraic equations whose solution provides complete information about the prebuckling equilibrium path. This leads to an eigenvalue problem, the eigenvalue being the critical compressive load and the eigenfunction being the corresponding buckling mode. Results are presented for shells of different geometries and material properties, and a comparison of results is made with results obtained by others. The imperfect shells analyzed all exhibit stable behavior, with sufficiently large imperfections having a beneficial effect. Results for bifurcation from these paths are also discussed. (13 refs.)

118460 Buckling and postbuckling of a long-hanging elastic column due to a bottom load. C.Y.Wang (Dept. of Maths., Michigan State Univ., East Lansing, MI, USA).
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.2, p.311-14 (June 1983).
A long heavy elastic column is supported at the top end. The bottom end is subjected to a compressive force. The critical buckling loads, related to zeroes of Airy functions, are quite different from the Euler buckling loads. Postbuckling shapes are integrated numerically. (6 refs.)

118461 Instability analysis of pressure-loaded thin arches of arbitrary shape. T.Q.Ye (Northwestern Polytech. Univ., Xi'an, Shaanxi, China), R.H.Gallagher.
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.2, p.315-20 (June 1983).
The governing differential equations and the virtual work expressions for the large displacement analysis of thin arches of arbitrary shape, subjected to pressure loads, are derived. The virtual work expressions are employed as the basis for formulation of finite element stiffness equations. Classical solutions are obtained, from the differential equations, for the buckling of circular rings under uniform 'follower' (hydrostatic) and 'dead' (constant direction) pressure loadings. Finite element solutions are calculated for elliptical rings for a wide range of axis ratios. (10 refs.)

(see also 43.40 Mechanical vibrations and shock)

118462 Large-amplitude vibration of an initially stressed thick circular plate. Lien-Wen Chen, Ji-Liang Doong (Nat. Cheng-Kung Univ., Tainan, Taiwan).
AIAA J. (USA), vol.21, no.9, p.1317-24 (Sept. 1983).
Nonlinear equations of motion are derived for a transversely isotropic thick circular plate in a general state of nonuniform initial stress. The equations include the effects of transverse shear and rotary inertia. The large-amplitude flexural vibrations of simply supported and clamped thick circular plates subjected to initial stress are also investigated. The initial stress is taken to be a combination of pure bending stress plus an extensional stress in the plane of the plate. Nonlinear equations of motion are used to solve the vibration problems by the Galerkin method. In addition, the effects of various parameters on the nonlinear vibration frequencies are studied. (22 refs.)

118463 Optimization of cylindrically orthotropic circular plates including geometric nonlinearity with a constraint on the fundamental frequency. G.Venkateswara Rao, K.Kanaka Raju (Aerospace Structures Div., Vikram Sarabhai Space Center, Trivandrum, India).
Comput. & Struct. (GB), vol.18, no.2, p.301-5 (1984).
Optimization of cylindrically orthotropic circular plates is studied with a constraint on the fundamental frequency when the effect of geometric nonlinearity is included. Details of finite element formulation for inclusion of geometric nonlinearity, derivation of optimality criterion and recurrence relations are presented. Results for various values of orthotropy parameter are given in tables. (12 refs.)

118464 Elastic waves in heterogeneous rectangular clad rod. M.Touratier (Lab. de Structures, ENSAM, Paris, France).
J. Mec. Theor. & Appl. (France), vol.2, no.4, p.503-38 (1983). In French.
Elastic wave dispersion analysis is presented for a clad rod. The clad rod consists of a core of one material surrounded by a cladding material having different properties. The influence of cladding and core proportion on wave propagation is analysed for longitudinal and flexural-torsion motions. The conditions for obtaining guided propagation modes are explained, explicit geometrical conditions being Stonely waves at the interface. The model is compared with numerical and experimental results obtained for a homogeneous rod. (13 refs.)

118465 On wave shifts in fibre reinforced composite materials. V.T.Golovchan.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.7, p.32-4 (1983). In Ukrainian.
The problem is solved of elastic shear wave propagation in fibrous composites with a general type of regular structure for the arbitrary direction of pro-

pagation. The dispersion equation is an infinite convergent determinant. (2 refs.)

118466 Influence of finite initial deformations on the velocity of Rayleigh waves in an incompressible half-space. O.M.Bagno, V.P.Koshman.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.9, p.18-20 (1983). In Ukrainian.
The Rayleigh wave propagation in an incompressible half-space was studied in terms of a three-dimensional linearized theory of elasticity. A variance equation is obtained for an incompressible body whose elastic properties are described by an arbitrary elastic potential. The dependence of dimensionless phase velocity of the Rayleigh wave on the initial deformation value was numerically determined for a neo-Hookean body. (9 refs.)

118467 Structures for solving the problems in plate theory with mixed boundary conditions. V.L.Rvachov, L.V.Kurpa.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.9, p.33-5 (1983). In Ukrainian.
New structures are proposed for solution of bending and vibration problems for plates of an arbitrary shape with variable boundary conditions. The derivation of these formulas is based on the use of *R*-functions. (2 refs.)

118468 Bending vibration of a simply supported rectangular plate with a crack parallel to one edge. R.Solecki (Univ. of Connecticut, Storrs, CT, USA).
Eng. Fract. Mech. (GB), vol.18, no.6, p.1111-18 (1983).
Natural flexural vibration of a simply supported rectangular plate with a symmetrically located crack parallel to one edge is considered. The problem is analyzed by means of finite Fourier transformation of discontinuous functions. The unknowns of the problem are the discontinuities of the displacement and of the slope across the crack. The singularities of the moments at the tips are 'built' in the solution. The conditional equations are obtained by satisfying the boundary conditions at the crack's edge. This requires differentiation of Fourier series representing a discontinuous function. The characteristic equation in form of an infinite determinant is obtained. Numerical data for certain geometries as well as comparison with existing results are included. (8 refs.)

118469 Plane waves in simple elastic solids and discontinuous dependence of solution on boundary conditions. Yongchi Li, T.C.T.Ting (Dept. of Civil Engng., Mech. & Metall., Univ. of Illinois, Chicago, IL, USA).
Int. J. Solids & Struct. (GB), vol.19, no.11, p.989-1008 (1983).
Using stress as the dependent variable instead of the deformation gradient, plane waves of finite amplitude in simple elastic solids are studied. For isotropic materials there are two plane polarized simple waves as well as shock waves and one circularly polarized simple wave which can also be regarded as a shockwave. With the aid of the stress paths for simple waves and shockwaves in the stress space introduced by the authors, one can see clearly what combination of simple waves and/or shockwaves is needed to satisfy the initial and boundary conditions. The authors use second order isotropic hyperelastic materials to illustrate the ideas. In one example the authors show that the solution requires as many as four simple waves. In another the authors show that depending on the boundary condition there are more than eight possible solutions to the problem. The authors also present an example in which the solution does not depend continuously on the boundary condition. This implies that in experiments if the applied load at the boundary is not properly controlled, any slight deviation in the applied load would result in a finite different response in the material. (14 refs.)

118470 Forced vibration of an anisotropic diaphragm with a concentric hole. G.C.D.Tyagi (Dept. of Math., DEI (Deemed), Dayalbagh.Univ.,Agra, India), G.C.Chadda.
Indian J. Pure & Appl. Math., vol.14, no.9, p.1118-37 (Sept. 1983).
The authors discuss the forced harmonic vibrations of a circular diaphragm of a homogeneous anisotropic elastic material of a particular type (reinforced concrete, Timoshenko and Wionowsky-Krieger, 1959) with a concentric, hole in response to the load field $q(r)e^{ipt}$. The technique of finite-Hankel transform is applied and behaviour of displacement field is analysed for $p=1$ and $p=\pi$ for the different values of t when $\bar{q}=0.713391, 1.5808828, 3.989238$, where $\bar{q}$ is the Hankel transform of $q(r)=q_0r^{m-1}$ for $m=1, 3, 5$. It is noted that for $p=1$ in the initial stage the displacement profiles are sinusoidal, but for large values of t they tend to become unimodal. Moreover, the displacements are comparatively larger near the inner edge. But when $p=\pi$, the displacements are larger near the outer edge and smaller near the inner edge. The case of isotropic medium is also compared with that of anisotropic medium graphically. (10 refs.)

118471 Vibration characteristics of self-expanding stayed columns for use in space. J.R.Banerjee, F.W.Williams (Dept. of Civil Engng. & Building Technol., Univ. of Wales Inst. of Sci. & Technol., Cardiff, Wales).
J. Sound & Vib. (GB), vol.90, no.2, p.245-61 (22 Sept. 1983).
The type of stayed column considered was developed by the ASTRO Research Corporation for NASA to evaluate, and is designed to be deployed in space after forming a light, compact package in the Space Shuttle. It consists of a core with three identical stay frames equally spaced around it. Each stay frame has a central compressed spoke with pretension stays which radiate from its end to the core. Three pretensioned battens connect the ends of the spokes. NASA performed vibration tests on a model of such a column and compared their results with approximate theoretical predictions. The authors give exact theoretical results, including natural frequencies and mode types not given in the NASA results. A substitute column method is used to achieve economy and a much deeper understanding of the modes. Approximations which give even greater economy and convenience are evaluated. A proposed design is analyzed alongside the NASA model. The proposed design is better than the NASA model because recent developments were implemented in the design method, and also because it has a graphite epoxy core whereas the NASA model had an aluminium one, due to temporary availability. (8 refs.)

118472 Dynamic response of a pre-stressed cylindrical shell to a moving load. K.Shirakawa (Dept. of Mech. Engng., Univ. of Osaka Prefecture, Osaka, Japan).
J. Sound & Vib. (GB), vol.90, no.2, p.263-73 (22 Sept. 1983).
The work presented is concerned with the response of a pre-stressed, finite, thin circular cylindrical shell under a moving local load with a constant velocity. An analysis is carried out by a dynamic method, and the solutions which are bounded even at the critical velocity are obtained. The effects of the initial stresses on the dynamic responses of the displacement and the stresses are examined in connection with the velocity of the load. (14 refs.)

118473 Free vibrations of a square plate symmetrically supported at four points on the diagonals. I.S.Raju (Vigyan Res. Associates Inc., Hampton, VA, USA), C.L.Amba-Rao.
J. Sound & Vib. (GB), vol.90, no.2, p.291-7 (22 Sept. 1983).
The purpose of this letter is threefold. The first is to present the first six symmetric-symmetric, antisymmetric-symmetric and antisymmetric-antisymmetric natural frequencies of a square plate resting on four point supports along the diagonals, as obtained by using finite element analysis. The second is to compare the present results with those of Gorman (1981), and the third is to attempt to clarify the discrepancies between the result of Venkateswara Ras et al. (1973) and Gorman (1981). (7 refs.)

118474 Eulerian formulation of transport equations for three-dimensional shock waves in simple elastic solids. T.C.T.Ting, Yongchi Li (Dept. of Civil Engng., Mech. & Metall., Univ. of Illinois, Chicago, IL, USA).
J. Elasticity (Netherlands), vol.13, no.3, p.295-310 (1983).
The propagation of a three-dimensional shock wave in an elastic solid is studied. The material is assumed to be a simple elastic solid in which the Cauchy stress depends on the deformation gradient only. It is shown that the growth or decay of a discontinuity ψ depends on (i) an unknown quantity ϕ^- behind the shock wave, (ii) the two principal curvatures of the shock surface, (iii) the gradient on the shock surface of the shock wave speeds and (iv) the inhomogeneous term which depends on the motion ahead of the shock surface and vanishes when the motion ahead of the shock surface is uniform. If a proper choice is made of the propagation vector b along which the growth or decay of the discontinuity is measured, the dependence on item (iii) can be avoided. However, b assumes different directions depending on the choice of discontinuity ψ with which one is concerned and the unknown quantity ϕ^- behind the shock wave on which one chooses to depend. As in the case of one-dimensional shock waves, the growth (or decay) of one discontinuity may not be accompanied by the growth (or decay) of other discontinuities. A universal equation relating the growth or decay of discontinuities in the normal stress, normal velocity and specific volume is also presented. (15 refs.)

118475 On the dissipation inequality in equilibrium shocks. C.Yatomi, N.Nishimura (Dept. of Aeronautical Engng., Kyoto Univ., Kyoto, Japan).
J. Elasticity (Netherlands), vol.13, no.3, p.311-16 (1983).
Presents expressions for the dissipation inequality corresponding to an equilibrium shock. These expressions are independent of the orientation of the shock. A sufficient condition on the constitutive equations for positive dissipation is given in the case of anti-plane deformations. (5 refs.)

118476 On the transverse vibration of a rubber string. M.F.Beatty, A.C.Chow (Dept. of Engng. Mech., Univ. of Kentucky, Lexington, KY, USA).
J. Elasticity (Netherlands), vol.13, no.3, p.317-44 (1983).
The nearly constant pitch of the sound radiated by a sufficiently stretched rubber cord, a phenomenon observed independently by two experimenters at the turn of the century, is explained analytically for three ideal rubberlike material models. Transverse vibrational frequency data for three kinds of rubber strings, obtained with the aid of a novel laser apparatus, are compared with the analytical results. A numerical scheme is introduced to compute from the experimental data the apparent average number of links in a molecular chain of a rubberlike material from both simple tension and transverse frequency measurements. It is shown that the nearly flat frequency response is a molecular network finite extensibility effect that is controlled by the apparent number of links in a chain of the molecular network structure. (10 refs.)

118477 Oscillations of a multilayer cylindrical panel with anisotropic layers under large deflections. B.A.Kiladze, I.N.Preobrazhenskii, A.Sh.Tskhvediani (Inst. of Subtropical Economy, Sukhumi, USSR).
Mech. Compos. Mater. (USA), vol.18, no.6, p.679-84 (Nov.-Dec. 1983). Translation of: *Mekh. Kompozitnykh Mater. (USSR)*, vol.18, no.6, p.1014-20 (Nov.-Dec. 1982). [received: Sept. 1983]
The energy continualization method is applied to a multilayer shell with anisotropic layers. The derived equations are applied to the solutions of the problem of oscillations of a panel of a multilayer cylindrical shell under large transverse deflections. The amplitude-frequency response characteristics of such oscillations are found. A shell consisting of alternating anisotropic bearings and binding layers is examined. (7 refs.)

118478 Surface Love waves in orthotropic regularly layered composites. A.N.Podlipenets (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian USSR).
Mech. Compos. Mater. (USA), vol.18, no.6, p.734-7 (Nov.-Dec. 1983). Translation of: *Mekh. Kompozitnykh Mater. (USSR)*, vol.18, no.6, p.1077-80 (Nov.-Dec. 1982). [received: Sept. 1983]
A solution of the problem of the propagation of LSW in orthotropic regularly layered composite materials is given, and the results of an analysis of the dispersion relations are presented. (6 refs.)

118479 Properties of a wave field in a semi-infinite elastic cylinder (boundary resonance). V.T.Grinchenko, V.V.Meleshko.
Mech. Solids (USA), vol.17, no.6, p.73-80 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.6, p.81-9 (1982). [received: Oct. 1983]
In considering forced wave motions in infinite and in particular in semi-infinite waveguides, a number of problems are encountered for which there are as yet no complete and clear-cut solutions. The authors offer some results that indicate the unusual nature of the response of a semi-infinite elastic cylinder to a nonaxisymmetric external load of the end face. (22 refs.)

118480 Universal characteristic equations in problems of vibration and stability of elastic systems. L.M.Zorii.
Mech. Solids (USA), vol.17, no.6, p.142-8 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.6, p.155-62 (1982). [received: Oct. 1983]
Develops a general method of setting up characteristic determinants that are universal for elastic systems, whose investigation can be reduced to one-dimensional problems. Some aspects of the development of the method of characteristic series are also considered. The method is applied to typical boundary-value problems for second-and fourth-order differential equations. The corresponding characteristic determinants of universal form are constructed and differential relations established between the functions they define. The author offers some examples of the use of universal equations in obtaining a number of working formulas. (12 refs.)

118481 Optimal longitudinal displacement of a rod. B.N.Sokolov.
Mech. Solids (USA), vol.17, no.6, p.149-55 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.17, no.6, p.163-70 (1982). [received: Oct. 1983]
The problem of optimal displacement of vibratory systems is investigated. The optimal longitudinal displacement of a rod by a prescribed distance with suppression of vibrations by means of a force applied to one of the end faces of the rod is considered. The optimality criterion is provided by a quadratic control function. (6 refs.)

118482 Combination resonances in systems with periodic parametric and random external excitation. M.F.Dimentberg, N.E.Isikov.
Mech. Solids (USA), vol.18, no.1, p.21-5 (1983). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.18, no.1, p.24-9 (1983).
Application of the averaging method to systems with periodically varying parameters acted upon by random external perturbations yields a system of shortened linear equations with constant coefficients in the slowly varying amplitudes of the vibrational processes. The authors employ the general method of analysis, described by Dimentberg et al. (1977), to make a detailed study of vibrational processes in a stable system with two degrees of freedom under conditions of sum or difference combination resonance. The results are employed, in particular, to identify combination parametric resonances in such systems. (5 refs.)

118483 Propagation of small perturbations in a system consisting of a prestressed compressible solid and a viscous compressible fluid. A.M.Bagno, A.N.Guz.
Mech. Solids (USA), vol.18, no.1, p.156-9 (1983). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela*, vol.18, no.1, p.167-70 (1983).
Presents a method for investigating wave propagation in a hollow compressible cylinder that contains a viscous compressible fluid and is subjected to large (finite) initial deformations. (12 refs.)

118484 On interaction of thermo-acoustic waves with the progress of phase transition: a continuum approach. II. Growth and decay of thermo-acoustic waves. K.Tanaka (Univ. of Osaka Prefecture, Osaka, Japan), Y.Tanigawa.
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.4, p.357-66 (July-Aug. 1983).
For pt.I see ibid., vol.28, no.3, p.277 (1983). The growth and decay of thermo-acoustic waves travelling in thermoplastic materials in the process of phase transition is situated. The governing equation of the amplitude of the waves is derived. (5 refs.)

118485 SH waves in composite media under initial stresses. S.Dey, S.P.Mukherjee (Indian School of Mines, Dhanbad, India).
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.4, p.387-93 (July-Aug. 1983).
Deals with the propagation of SH waves in composite media consisting of three layers of different rigidity and density under different initial stresses. The frequency equation giving the velocity of SH waves has been obtained in closed form. As particular cases, the frequency equations of Love waves having two superficial layers over a half space, with one superficial layer over a half space and in sandwiched layer between two half spaces all under initial stresses have been derived. An interesting discussion on the existence of Love waves depending upon the initial stresses is given. The results tally with the classical cases in the absence of initial stresses. (3 refs.)

118486 The influence of external and internal friction on the dissipative vibrations of straight bars. I.Constantinescu (Inst. de Mine Petrosani, Rumania).
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.4, p.427-30 (July-Aug. 1983). In French.
Considering the external friction as proportional to speed, and introducing internal friction by use of Kelvin's viscoelastic body model, the author studies free and forced vibrations of straight bars with cross-sections of variable length. He concludes that the external friction damps particularly the low frequencies and internal friction the high ones, so that the presence of both types of friction plays the same role as the attenuating band-pass filter in electrotechnology. (6 refs.) *M.B.D.*

118487 On the radiation and diffraction of the two dimensional elastic waves in an infinite domain of homogeneous medium. M.Bessho (Dept. of Mech. Engng., Nat. Defense Acad., Yokosuka, Japan), H.Kawabe.
Sci. & Eng. Rep. Natl. Def. Acad. (Jpn.) (Japan), vol.20, no.4, p.343-81 (Dec. 1982). In Japanese. [received: Sept. 1983]
The theory of vibration of a solid body or a cavity in an infinite domain of elastic medium by in-coming plane waves is treated and summarized as follows: (i) some formulations of the boundary integral equation to solve its boundary value problem are discussed and proposed; (ii) the far field property is described introducing the so-called Kochin's function, that is the amplitude of radiating cyclindrical waves; (iii) the long wave approximations are identified to the static problem of elasticity; (iv) the reciprocity and the vibrational principle of boundary value problems are described; (v) the complex conjugates of the displacement or stress in the field are represented as the sum of the original vibration and diffraction term; (vi) formulating the equation of motion by making use of Haskind's relation the most favourable condition to absorb wave energy is obtained and its maximum absorbing sectional area of wave power is formulated; and (vii) various numerical examples are shown for a circular cylindrical boundary. (25 refs.)

118488 Interaction of a *P*-wave with a laterally stiffened slot. R.L.Ryan, S.Mall (Dept. of Mech. Engng., Univ. of Maine, Orono, ME, USA).
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.1, p.63-6 (March 1983). [received: Oct. 1983]
The interaction of a longitudinal wave with a narrow cavity or slot that contains an inclusion is considered. A singular integral equation is derived for the scattered field and the integral equation is solved numerically by a Gauss-Chebyshev technique. The stress intensity at the ends of the slot is obtained as a function of frequency and inclusion stiffness for both a continuous and discrete element inclusion. (10 refs.)

118489 Magnetoelastic plane waves in infinite rotating media. S.K.Roy Choudhuri (Dept. of Maths., Burdwan Univ., Burdwan, India), L.Debnath.
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.2, p.283-7 (June 1983).
A study is made of the propagation of magnetoelastic plane waves in an electrically conducting, infinite elastic solid permeated by a primary uniform magnetic field when the entire medium rotates with a constant angular velocity. A more general dispersion relation is obtained to investigate the effects of rotation and the external magnetic field on the phase velocity of the waves. This analysis reveals that when the applied magnetic field has both longitudinal and transverse components, the coupled magnetoelastic waves are dispersive and damped in an infinitely conducting medium in contrast to the nonrotating medium where the coupled waves are dispersive, but undamped. In the case of finite conductivity, the waves are dispersive and undamped in the absence of the applied magnetic field. At low frequency ω, the phase velocity of the waves varies as $\omega^{1/2}$ for finite conductivity, and is independent of the external magnetic field and rotation; while in the nonrotating case with low frequency (when the applied magnetic field has either longitudinal or transverse components) the phase speed is less than that in the rotating medium and is found to depend on the applied magnetic field. Also in both rotating and nonrotating cases, the phase velocity becomes very small for finitely conducting material with a very high magnetic permeability. (10 refs.)

46.30N Fracture mechanics, fatigue, and cracks

118490 The fracture diagram: a new design tool for stiffened panels. M.M.Ghassem, T.P.Rich.
AIAA J. (USA), vol.21, no.9, p.1294-300 (Sept. 1983).
A detailed explanation is presented for the use of fracture diagram in the design of stiffened panels. Based upon some recent work on the development of fracture diagrams for a large sheet containing a crack midway between two parallel, riveted stiffeners, this paper emphasizes a methodology for employing fracture diagrams to estimate maximum loads, critical flaw sizes, and fatigue life for stiffened panels. In addition, the fracture diagram approach enables failure predictions to be made ranging from linear elastic rapid crack propagation to net section failure at the ultimate strength level of the material. The fracture diagrams are dimensionless and can be used for any material where meaningful yield strength and fracture toughness properties are available. References are provided for background and theoretical development of the fracture diagram approach. (14 refs.)

118491 Numerical and experimental study of stress concentration in elastic solids. M.A.Astiz Suarez, A.Valiente Cancho, M.Elices Calafat (Univ. Politecnica de Madrid, Madrid, Spain).
An. Fis. Ser. B (Spain), vol.79, no.2, p.65-76 (May-Aug. 1983). In Spanish. [received: Oct. 1983]
The stress concentration caused by notches on elastic bodies is an important topic in fracture mechanics. These stress concentrations are necessary to indicate fatigue cracking and hydrogen embrittlement. Numerical and experimental analysis are used to determine if the Creager and Paris stress field near a notch can describe the stress concentration in any notched body. Therefore, some interesting uses of this stress field in fracture mechanics are considered. (14 refs.)

118492 Determination of the crack stability parameters of materials using acoustic signal characteristics. O.E.Andreikiv, M.V.Lisak.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.7, p.25-7 (1983). In Ukrainian.
The subcritical crack propagation is investigated in an elastoplastic body under monotonic loading. The correlation is determined between acoustic emission signal and crack jump length and between stress intensity factor and total acoustic emission during subcritical growth of mode I crack. The analytical relationships are in good agreement with data from the literature. (8 refs.)

118493 Strain energy density fracture criterion in elastodynamic mixed mode crack propagation. M.Ramulu, A.S.Kobayashi (Dept. of Mech. Engng., Univ. of Washington, Seattle, WA, USA).
Eng. Fract. Mech. (GB), vol.18, no.6, p.1087-98 (1983).
Sih's fracture criterion based on strain energy density, S, for mixed mode crack extension under static loading is extended to dynamic mixed mode, K_I, and K_{II}, crack propagation. Influence of the second order term, σ_{ox}, which represents the nonsingular constant stress acting parallel to the direction of crack propagation, on the S distribution surrounding the crack tip is demonstrated. Numerical studies show that positive σ_{ox} enhances the fracture angle and negative σ_{ox} reduces the fracture angle irrespective of the sign of K_{II}/K_I, when S is measured as a critical distance r_c from the crack tip. This fracture criterion is verified by the crack curving results of dynamic photoelastic fracture specimens. Omission of σ_{ox} term leads to predicted fracture angles which are at variance with experimental data. (28 refs.)

118494 Effects of crack growth on the load-displacement characteristics of precracked specimens under bending. T.-J.Chuang, L.Chuck, R.J.Fields, E.R.Fuller (Center for Materials Sci., NBS, Washington, DC, USA).
Eng. Fract. Mech. (GB), vol.18, no.6, p.1099-109 (1983).
A critical evaluation of the feasibility of obtaining crack growth parameters from quasi-static bend tests is presented. First derived are the governing differential equations which characterize the time-history of bend test parameters for a given elastic material exhibiting power law crack growth behavior (ν-$\nu_{max}(K_I/K_{IC})$N). A numerical solution scheme is then developed which is capable of solving the initial value problem, thus quantitatively assessing the influence of crack growth on the load-displacement output. The results indicate that in order to calculate K_{IC} accurately based on the peak load data, the loading rate has to be set sufficiently fast compared to ν_{max} (but below dynamic rates), otherwise, it will generally overestimate its true value whenever slow crack growth occurs during the test; and that for high N materials the flexural test method gives a broad error band in N prediction and hence is not a reliable technique. However, it can be used by a designer

to quickly screen the new materials with high N values which are potential candidates for structural application. (10 refs.)

118495 The geometry dependence of the J_β curve for circumferential growth of through-wall cracks in cylindrical pipes subject to bending loads. E.Smith (Joint Manchester Univ./Univ. of Manchester Inst. of Sci. & Technol. Metall. Dept., Manchester, England).
Eng. Fract. Mech. (GB), vol.18, no.6, p.1119-23 (1983).
Proceeding from the experimental observation that circumferential crack growth in circular cylindrical pipes subject to bending loads is associated with a constant crack tip opening angle, the J_R curve is predicted in terms of the pipe and crack prameters. The predictions compare favorably with experimental results for 4 in (~10 cm) diameter pipes containing cracks with different sizes. (5 refs.)

118496 Reinitiation of an arrested cleavage crack. A.R.Rosenfield, P.N.Mincer (Phys. Metall. Section, Battelle-Columbus Labs., Columbus, OH, USA).
Eng. Fract. Mech. (GB), vol.18, no.6, p.1125-9 (1983).
Transverse-wedge-loaded compact specimens were used to measure the fracture toughness associated with reinitiation of an arrested cleavage crack. The data are consistent with more conventional measurements as well as large-cylinder thermal-shock results. It is suggested that this procedure can provide single-specimen crack-initiation and crack-arrest toughness. (10 refs.)

118497 Characteristics of brittle fracture under general combined modes including those under bi-axial tensile loads. Y.Ueda (Welding Res. Inst., Osaka Univ., Japan), K.Ikeda, T.Yao, M.Aoki.
Eng. Fract. Mech. (GB), vol.18, no.6, p.1131-58 (1983).
The brittle fracture initiation characteristics under general combination of the opening mode (Mode I), sliding mode (Mode II) and tearing mode (Mode III) were investigated both theoretically and experimentally. First, the perfectly brittle fracture tests were conducted on specimens of PMMA for all possible combinations of the fracture modes including respective pure modes. It was found that the $[G^k(\gamma)]_{max}$ or $[G(\gamma)]_{max}$ criterion was very effective to predict both the direction of initial crack propagation and the fracture strength. These energy release rates are expressed in closed forms, and the interaction curves of the brittle fracture strength under arbitrary combination of Modes I, II and III were derived. Next, for fracture accompanied by plastic deformation, tests were carried out on specimens of mild steel (SM 41) imposing bi-axial tensile loads at various low temperatures. Then, brittle fracture with plastic deformation occurs under a combination of Modes I and II. In the case of brittle fracture with small scale yielding, the $[G(\gamma)]_{max}$ criterion predicts well the direction of initial crack propagation but estimates only lower fracture strength than the experimental one. In the case of brittle fracture with large scale yielding and under general yielding, it was found from the fracture tests that the direction of initial crack propagation was nearly normal to the resultant vector of the crack opening displacements in the opening and sliding modes at the notch tip. (26 refs.)

118498 Crack growth resistance characterized by the strain energy density function. G.C.Sih, E.Madenci (Inst. of Fracture & Solid Mech., Lehigh Univ., Bethlehem, PA, USA).
Eng. Fract. Mech. (GB), vol.18, no.6, p.1159-71 (1983).
Stable ductile fracture of a typical metal alloy is found to be governed by the condition dS/da=const., i.e. the rate change of the strain energy density S with crack length $2a$ (or a) remained constant. Since fracture and/or yielding are load rate dependent, the incremental theory of plasticity is employed for analyzing crack growth where unloading in the material near the crack can take place. Attention is focused on the energy per unit volume, dW/dV, stored along the prospective path of crack growth. The nearest neighbor continuum element must necessarily be at a finite distance r from the crack front. This leads to the general relation $dW/dV=S/R$. The critical value $(dW/dV)_c$ representing the area under the uniaxial true stress and strain curve is assumed to correspond with failure of material elements. If yielding and unloading occurred locally, a certain amount of irrecoverable energy will not be available for dissipation during macrocracking. Hence, the threshold energy density must be modified to read as $(dW/dV)_c^* < (dW/dV)_c$. The quantity $(dW/dV)_c^*$ may be regarded as the crack growth resistance whose magnitude decreases with increasing distance from the crack tip at which point yielding is most intensified. (11 refs.)

118499 Transition of Hertzian fracture to flexure fracture produced in glass plates by impact. Y.M.Tsai, Y.T.Chen (Dept. of Engng. Sci. & Mech., Iowa State Univ., Ames, IO, USA).
Eng. Fract. Mech. (GB), vol.18, no.6, p.1185-90 (1983).
The strength and fracture of a glass plate in a three-dimensional state of stress produced by the transverse impact of a spherical body is investigated. The plate is supported by a ring foundation whose radius is comparable to the thickness of the plate. A general impact theory is developed to determine the critical stresses in the plate as a function of impact velocity, plate thickness, and support span. Impact experiments were carried out to measure the impact velocity required to fracture a glass plate specimen as function of support span. Hertzian fracture was observed at a short span of support whereas flexure fracture was observed at a larger support span. The impact velocity of fracture was measured to be increasing with increasing support span and its corresponding critical stress of fracture was also determined. (10 refs.)

118500 Simple bounds for the stress intensity factors by the method of singular integral equations. N.I.Ioakimidis (Chair of Maths B, School of Engng., Univ. of Patras, Patras, Greece).
Eng. Fract. Mech. (GB), vol.18, no.6, p.1191-8 (1983).
The method of singular integral equations has become a classical method for solving plane and antiplane, static and dynamic crack problems in isotropic and anisotropic elasticity, particularly in cases where no closed-form solutions are available. Very simple methods are suggested for obtaining upper bounds for the stress intensity factors at the crack tips from the corresponding singular integral equation without solving this equation, even numerically, and with very few computations. Naturally, such a simplicity should lead to very conservative bounds and this is really the case. But, clearly, in a lot of practical cases such bounds are sufficient. Numerical results in simple crack problem show the efficiency of the proposed methods. (28 refs.)

118501 A remark on the solution of the integral equation of planar cracks in three-dimensional elasticity. N.I.Ioakimidis (School of Engng., Univ. of Patras, Patras, Greece).
Eng. Fract. Mech. (GB), vol.18, no.6, p.1199-200 (1983).
It is proposed that the classical integral equation of a planar crack under normal loading in three-dimensional isotropic elasticity is solved after an integration with respect to the Laplace operator. Then this equation coincides with the fundamental equation of contact problems for an isotropic elastic half-space. The problem of an elliptical crack under a constant normal loading is solved by the present approach. (8 refs.)

118502 A note on the cracked plates reinforced by a line stiffener. O.S.Yahsi, F.Erdogan (Lehigh Univ., Bethlehem, PA, USA).
Eng. Fract. Mech. (GB), vol.18, no.6, p.1211-15 (1983).
In this note the problem of a cracked plate reinforced reinforced by a line stiffener is reconsidered. The original solution of the problem was given by Greif and Sanders (1965). A variation of the problem with debonding between the plate and the stiffener near the cracked region was considered by Arin (1974). However, the special case of the problem in which the crack tip terminates at the stiffener does not appear to have been studied. In practice the solution may be necessary in order to assess the crack arrest effectiveness of the stiffener. (3 refs.)

118503 A cylindrical shell with an arbitrarily oriented crack. O.S.Yahsi, F.Erdogan (Lehigh Univ., Bethlehem, PA, USA).
Int. J. Solids & Struct. (GB), vol.19, no.11, p.955-72 (1983).
Considers the general problem of a shallow shell with constant curvatures. It is assumed that the shell contains an arbitrarily oriented through crack and the material is specially orthotropic. The nonsymmetric problem is solved for arbitrary self-equilibrating crack surface tractions which, added to an appropriate solution for an uncracked shell would give the result for a cracked shell under most general loading conditions. The problem is reduced to a system of five singular integral equations in a set of unknown functions representing relative displacements and rotations on the crack surfaces. The stress state around the crack tip is asymptotically analyzed and it is shown that the results are identical to those obtained from the two-dimensional in-plane and anti-plane elasticity solutions. The numerical results are given for a cylindrical shell containing an arbitrarily oriented through crack. Some sample results showing the effect of the Poisson's ratio and the material orthotropy are also presented. (16 refs.)

118504 A growth law for propagation of arbitrary shaped delaminations in layered plates. W.J.Bottega (Section of Appl. Math., Yale Univ., New Haven, CT, USA).
Int. J. Solids & Struct. (GB), vol.19, no.11, p.1009-17 (1983).
A growth law is derived which governs the propagation of a delamination embedded in a layered plate, with the shapes of the delaminated area and of the plate assumed to be arbitrary. The plate is considered to be subjected to edge loading. (3 refs.)

118505 Upper and lower bounds for energy-release rates in an elastic body. P.Rafalski (Inst. of Nuclear Res., Warsaw, Poland), A.Golebiewska-Herrmann.
Int. J. Solids & Struct. (GB), vol.19, no.11, p.1019-23 (1983).
A numerical method of evaluation of the energy-release increment resulting from the crack propagation in the elastic body is proposed. The method is based on the extremum principles established for the elastic-perfectly plastic body. An example of calculation of the upper and lower bounds for the energy released in edge-crack specimen is given. (2 refs.)

118506 Interaction of shear waves with two coplanar Griffith cracks situated in an infinitely long elastic strip. K.N.Srivastava, R.M.Palaiya, D.S.Karaulia (M.A. Coll. of Technol., Bhopal, India).
Int. J. Fract. (Netherlands), vol.23, no.1, p.3-14 (Sept. 1983).
In an earlier paper (see ibid., vol.21, p.39, 1983), the authors have studied the case of interaction of shear waves with a crack centrally situated in an infinite elastic strip; they now extend the study to the case of two coplanar Griffith cracks. An integral transform method is used to find the solution of the equation of motion from the linear theory for a homogeneous, isotropic-elastic material. This method resolves the problem into an integral equation. It has been observed that shear waves with frequencies less than a parameter depending on the width of the wave guide can only propagate. The integral equation is solved numerically for a range of values of wave frequency, width of strip and the inter-crack distance. These solutions are used to calculate the dynamic stress intensify factor. The results are shown graphically. (10 refs.)

118507 Resonance controlled fatigue crack propagation in a beam under longitudinal vibrations. A.J.Dentsoras, A.D.Dimarogonas (Machine Design Lab., Univ. of Patras, Patras, Greece).
Int. J. Fract. (Netherlands), vol.23, no.1, p.15-22 (Sept. 1983).
Fatigue crack growth in resonating members of distributed mass is studied under conditions of dynamic interaction between crack growth and crack load. The crack propagation rate is related to the stress intensity factor range by way of the well known power law. The depth of the crack determines the local flexibility due to crack which in turn influences the dynamic response of the system under an external force with constant amplitude and frequency. The propagating crack introduces additional flexibility to the continuous system which results in gradual shifting away of the resonance which results in smaller loading of the cracked section. This reduces, in general, the growth rate and brings eventually the system to a value of crack propagation rate below a conventional threshold rate which can be interpreted as dynamic crack arrest. Material damping is introduced through the use of complex modulus of elasticity and determines absolutely the crack growth rate in resonance, assuming that material damping is the dominant damping mechanism of the system. (16 refs.)

118508 The mechanics of splitting a strip through penetration with a sharp wedge. N.C.Huang (Dept. of Aerospace & Mech. Engng., Univ. of Notre Dame, Notre Dame, IN, USA).
Int. J. Fract. (Netherlands), vol.23, no.1, p.23-35 (Sept. 1983).
Deals with the mechanics involved in splitting a strip through penetration with a sharp wedge along the center line. First, a quasi-static problem is considered. The crack propagation can be associated with the loss in stability when the applied load reaches the critical value for bifurcation. Next, the static problem is extended to a dynamic case by including the inertia force of the wedge in the analysis. An initial value problem is formulated for the motion of the wedge. For any given weight of the wedge, the critical velocity of the wedge for indefinite crack propagation can be determined by means of the theory of dynamic stability. Finally, the case of splitting a strip under repeated applications of impulsive load is considered. The critical number of applications of impulsive load for indefinite crack propagation is determined numerically. (9 refs.)

118509 Why do cracks avoid each other?. S.Melin (Div. of Solid Mech., Lund Inst. of Technol., Lund, Sweden).
Int. J. Fract. (Netherlands), vol.23, no.1, p.37-45 (Sept. 1983).
The experimentally known phenomenon that originally collinear mode I cracks seem to avoid each other before coalescence is studied by investigating the stability of straight crack paths. To this end a periodic array of approximately collinear but slightly curved cracks is considered. Stress intensity factors for modes I and II are derived and the growth of originally straight cracks under mode I conditions is studied after introduction of a disturbance that forces the cracks to deviate from a straight path. It is shown that the straight crack path is unstable, i.e. that tip to tip coalescence will not take place. (9 refs.)

118510 Crack generated wave fronts. H.Cohen, S.J.Matysiak (Dept. of Civil Engng., Univ. of Manitoba, Winnipeg, Canada).
Int. J. Fract. (Netherlands), vol.23, no.1, p.61-9 (Sept. 1983).
Considers cracks of a fixed size and shape which exist in an unbounded linear elastic body. The crack faces are assumed to suffer a sudden disturbance, which results in a shock wave emanating from the region of the crack into the body. The geometry and physics are assumed such as to give rise to problems governed by the equations of two-dimensional elastodynamics. For a crack of finite length, two approaches are utilized to find the shape of the wave front which will propagate into a body with homogeneous material properties. For a semi-infinite crack an analogous problem is solved, but in this case for a body with nonhomogeneous cylindrically symmetric material properties. The authors conclude with a heuristic discussion of the corresponding situation within the framework of three-dimensional elastodynamics. (6 refs.)

118511 Distribution function of dislocations and condition of finite stress for the dislocation-free zone model of fracture. S.-J.Chang (Engng. Technol. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA), S.M.Ohr.
Int. J. Fract. (Netherlands), vol.23, no.1, p.R3-10 (Sept. 1983).
In order to investigate the role of the dislocation-free zone in crack tip processes, the authors have extended the Bilby-Cottrell-Swinden (BCS) theory of fracture to treat the problem of elastic-plastic cracks in terms of an equilibrium distribution of dislocations. A singular integral equation was formulated and the distribution function of dislocations was obtained in terms of elliptic integrals. (5 refs.)

118512 Viscoelastic crack growth.
Int. J. Fract. (Netherlands), vol.23, no.1, p.R11-13 (Sept. 1983).
Examines the crucial aspects of the arguments concerning the role of conservation of energy in viscoelastic crack kinetics. It is shown that the different points of view can be reconciled, and a unified explanation for kinetic effects is given. (6 refs.)

118513 Contour integral around a crack at the root of a step loaded in antiplane strain. W.S.Blackburn, J.N.Swingler (Sci. Services Dept., CEGB, Gravesend, England).
Int. J. Fract. (Netherlands), vol.23, no.1, p.R15-21 (Sept. 1983).
The plastic zone size and crack tip opening displacement are calculated at the tip of the crack at the root of a sharp step of arbitrary angle loaded in anti-plane strain. A semi-infinite region of elastic, perfectly plastic material is assumed containing a step and having the component of stress normal to the zone made equal to the yield stress. (1 ref.)

118514 The geometry dependence of the J_R curve for the growth of a deep crack in a solid subjected to bending deformation. E.Smith (Metall. Dept., Univ. of Manchester, Inst. of Sci. & Technol., Manchester, England).
Int. J. Fract. (Netherlands), vol.23, no.1, p.R29-32 (Sept. 1983).
Compares results from the model by Tada, Paris and Ganoble (1979) which uses a simple representation of plasticity, with those of the more realistic model by Rice, Drugan and Sham (1980). There are close similarities implying that the simple approach may be used in reasonable confidence as regards its predictions. (14 refs.)

118515 Large deformations near a tip of an interface-crack between two Neo-Hookean sheets. J.K.Knowles, E.Sternberg (Div. of Engng. & Appl. Sci., California Inst. of Technol., Pasadena, CA, USA).
J. Elasticity (Netherlands), vol.13, no.3, p.257-93 (1983).
Contains an asymptotic investigation—within the nonlinear theory of elastostatic plane stress—of the deformations and stresses near the tips of a traction-free interface-crack between two dissimilar semi-infinite Neo-Hookean sheets. The results obtained are free of oscillatory singularities of the kind predicted by the linearized theory, which would require the two deformed faces of an interface-crack to overlap in the vicinity of its tips. Instead, the crack is found to open smoothly near its ends, regardless of the specific loading at infinity. (18 refs.)

118516 Stress redistribution in a ruptured fiber of a viscoelastic composite. M.B.Pobedrya (M.V. Lomonosov Moscow State Univ., Moscow, USSR).
Mech. Compos. Mater. (USA), vol.18, no.6, p.663-8 (Nov.-Dec. 1983). Translation of: *Mekh. Kompozitnykh Mater. (USSR),* vol.18, no.6, p.995-1001 (Nov.-Dec. 1982). [received: Sept. 1983]
States the dynamic and quasistatic problem concerning stress redistribution in a fibrous composite, the fibers and matrix of which are a linear viscoelastic material (generally speaking, different), where one of the fibers has failed. An approximate solution is derived for arbitrary relaxation centers of the matrix and fibers using the Sheperi method. (11 refs.)

118517 Stationary subsonic motion of a cut in an elastic strip. I.V.Simonov.
Mech. Solids (USA), vol.17, no.6, p.81-90 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela,* vol.17, no.6, p.90-9 (1982). [received: Oct. 1983]
Investigates the properties of the wave field in an elastic strip with a semi-infinite cut. Cases are considered in which the edge of the cut moves in two directions, corresponding to the problem of oblique collision of plates and to the problem of propagation of a crack under a stationary load. Using the Fourier transformation, the problem is reduced to a generalized Riemann problem. The factorization method is used to obtain a solution that contains arbitrary constants, which are determined from the conditions at singular points. The author discusses differences between his results and previous results which correspond to versions of the same problem, but with energy sources at singular points. The possibility of crack propagation with super-Rayleigh velocity with a load of varying sign is considered. An estimate is offered for the magnitude of the tensile stresses on the continuation of the crack in the collision problem. (24 refs.)

118518 Brittle fracture under creep. A.A.Vakulenko,Jr..
Mech. Solids (USA), vol.17, no.6, p.107-12 (1982). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela,* vol.17, no.6, p.117-23 (1982). [received: Oct. 1983]
A variety of recent experiments indicate that the change in density of metal specimens under creep frequently runs as high as 1-2%. In view of this, it has been proposed that the damage parameter be provided by the relative change in density $(\rho-\rho_0)/\rho_0$. Obviously , since $\rho=\rho_0(1+\epsilon_v)^{-1}$, where ϵ_v is the relative change in volume, the damage parameter can be provided by ϵ_v (or by a suitable function of this quantity) with equal success. In this case the entire characteristic pattern of the longevity as a function of the stress level under creep for a rod acted upon by a fixed tensile force follows from one clear-cut experimental fact. Even more important, with this choice of the damage parameter it is possible to develop, in a fairly simple way, the foundations of a statistical approach to quasi-brittle fracture under creep. (14 refs.)

118519 Stress redistribution in a rupturing fiber as it peels away from a viscoelastic matrix of composition material. V.V.Moskvitin, V.V.Moskvitin.
Mech. Solids (USA), vol.18, no.1, p.106-11 (1983). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela,* vol.18, no.1, p.114-19 (1983).
As a rule, rupture of a fiber in a composition material is accompanied by a peeling away of some portion of the ruptured fiber from the matrix. A nonlinear long-term strength condition is introduced as the peeling criterion. The model of the material that is employed makes it possible to investigate dynamic stress redistribution in the process of peeling away of a viscoelastic matrix from a fiber. (5 refs.)

118520 Bounds and approximate formulas in the problem of a plane normal-separation crack in elasticity. R.V.Gol'dshtein, E.I.Shifrin.
Mech. Solids (USA), vol.18, no.1, p.112-19 (1983). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela,* vol.18, no.1, p.120-7 (1983).
The authors construct two approximate formulas for the volume of a crack occupying a convex region that satisfies the conditions outlined by Polya and Szego (1962). One expresses the volume in terms of the area of G and the torsional stiffness of a rod with cross section G; the other expresses the volume in terms of the area of the region and the length of the contour that bounds it. In addition, an approximate formula is proposed for determining the stress intensity coefficient in terms of the coefficient in the asymptotic form at the boundary of the region of the torsion function. Finally, the bounds and approximate formulas for the crack volume, in combination with the bound established earlier by Gol'dshtein et al. (1981) in terms of the volume of a crack with maximum stress intensity coefficient (N_{max}) along the crack contour, yield fairly efficient lower bounds for N_{max}. These bounds provide sufficient conditions for crack propagation. (9 refs.)

118521 On the problem of thermal failure under rapid heating. S.A.Shesterikov, M.A.Yumasheva.
Mech. Solids (USA), vol.18, no.1, p.120-7 (1983). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela,* vol.18, no.1, p.128-35 (1983).
Under certain heating conditions, it is possible to observe a fracture effect for times comparable to the heating time; and in some cases fracture is possible after the action of the heat source has been removed. The authors make a detailed analysis of the process of thermal failure of an element of elastic-brittle material, also with allowance for plastic properties, using the example of a beam of which one web is heated instantaneously to a prescribed temperature. (3 refs.)

118522 Interaction between a surface wave and a crack on a curvilinear surface. I.S.Guz.
Mech. Solids (USA), vol.18, no.1, p.160-4 (1983). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela,* vol.18, no.1, p.171-5 (1983).
Allowing for the fact that cracks are frequently encountered on curvilinear surfaces in practice, and that the curvature affects the stress distribution in the surface wave, the author examines the interaction between a surface wave and a crack on a convex surface. (4 refs.)

118523 On the estimation of energy release rates. R.Abeyaratne (Coll. of Engng., Michigan State Univ., East Lansing, MI, USA).
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.1, p.19-23 (March 1983). [received: Oct. 1983]
The energy release rate associated with the Mode I and Mode III crack problems for an infinite, nonlinearly elastic, incompressible body are estimated. The calculation adopts an approximation that is a natural extension of the small-scale yielding concept to problems involving moderate levels of loading. The results are compared with available exact and numerical solutions and the agreement is found to be remarkably good. The scheme used here, based on the theory of small deformations superposed on a finite deformation, can be utilized to estimate the energy release rate in many other crack problems. (16 refs.)

118524 Thermal stress in a transversely isotropic medium containing a penny-shaped crack. Y.M.Tsai (Dept. of Engng. Sci. & Mech., Iowa State Univ., Ames, IA, USA).
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.1, p.24-8 (March 1983). [received: Oct. 1983]
The thermal stress problem for a penny-shaped crack contained in a transversely isotropic medium is investigated using the techniques of Hankel transforms and double integrations. Symmetrical thermal loadings are applied over the crack surfaces. For constant temperature and heat flux over the crack surfaces, expressions for the crack shapes and the thermal stresses in the crack plane are obtained in closed forms. The stress intensity factors are also obtained and shown to be dependent on the material properties. (11 refs.)

118525 The penny-shaped interface crack with heat flow. I. Perfect contact. C.J.Martin-Moran (Dept. of Mech. Engng., Univ. of Newcastle upon-Tyne, Newcastle upon Tyne, England), J.R.Barber, M.Comninou.
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.1, p.29-36 (March 1983). [received: Oct. 1983]
A solution is given for the thermal stresses due to a penny-shaped crack at the interface between dissimilar materials loaded in tension for the case where the heat flux is into the material with higher distortivity. Regions of separation and perfect thermal contact are developed at the crack faces. A harmonic potential function representation is used to reduce the problem to a three-part boundary value problem which is formulated as a pair of coupled Abel integral equations using the method of Green and Collins. These equations are further reduced to a single Fredholm equation which is solved numerically. Results are presented illustrating the effect of heat flux and applied tractions on the contact radius and the stress intensity factors for various combinations of material constants. The effect of heat flux is profoundly influenced by the relative signs of Dundurs constant β and a constant γ describing the mismatch of distortivities. If the more distortive material is also the more rigid, the contact region at the crack face is reduced by heat flow; otherwise it is increased. In the latter case, solutions involving separation are obtained even for applied compressive tractions if the latter is within a certain range. (20 refs.)

118526 Axisymmetric singular stresses in a thick-walled spherical shell with an internal edge crack. A.Atsumi, Y.Shindo (Dept. of Mech. Engng. II, Tohoku Univ., Sendai, Japan).
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.1, p.37-42 (March 1983). [received: Oct. 1983]
Considers the elastostatic axisymmetric problem for a thick-walled spherical shell containing a circumferential edge crack on the inner surface. The ring-shaped edge crack and the inner surface of the spherical shell are subjected to internal pressure. Using an integral transform technique the authors obtained a singular integral equation of the first kind which has a generalized Cauchy kernel as the dominant part. The integral equation is solved numerically, and the influence of the geometrical configuration on the stress-intensity factor and the crack-opening displacement is shown graphically in detail. (9 refs.)

118527 Stress distributions for a quarter plane containing an arbitrarily oriented crack. L.M.Keer, J.C.Lee, T.Mura (Dept. of Civil Engng., Northwestern Univ., Evanston, IL, USA).
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.1, p.43-9 (March 1983). [received: Oct. 1983]
A solution for an elastic quarter plane containing an arbitrarily oriented crack is presented. The problem is formulated by means of Mellin integral transforms and reduced to a system of two coupled singular integral equations where the unknown quantities are the dislocation densities that characterize the crack. Numerical solutions are investigated for various orientations of the cracks. In each case the stress intensity factors are computed for the different parameters. (6 refs.)

118528 Dynamic singular stresses for a Griffith crack in a soft ferromagnetic elastic solid subjected to a uniform magnetic field. Y.Shindo (Dept. of Mech. Engng., Tohoku Univ., Sendai, Japan).
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.1, p.50-6 (March 1983). [received: Oct. 1983]
The problem of the diffraction of normally incident longitudinal waves on a Griffith crack located in an infinite soft ferromagnetic elastic solid is considered. It is assumed that the solid is a homogeneous and isotropic one and is permeated by a uniform magnetostatic field normal to the crack surfaces. Fourier transforms are used to reduce the problem to two simultaneous dual integral equations. The solution to the integral equations is expressed in terms of a Fredholm integral equation of the second kind having the kernel that is a finite integral. The dynamic singular stress field near the crack tip is obtained and the influence of the magnetic field on the dynamic stress intensity factor is shown graphically in detail. Approximate analytical expressions valid at low frequencies are also obtained and the range of validity of these expressions is examined. (12 refs.)

118529 Finite element analysis of steadily moving contact fields. J.Padovan, S.Tovichakchaikul (Dept. of Mech. Engng., Univ. of Akron, Akron, OH, USA), I.Zeid.
Comput. & Struct. (GB), vol.18, no.2, p.191-200 (1984).
By introducing a moving updated Langrangian observer, this paper develops traveling finite elements with the capacity to handle the global response resulting from steadily moving contact fields. The generality of the results is such that large deformation kinematics and kinetics as well as the full compliment of inertial fields can be handled. To streamline the handling of nonlinear behaviour, an elliptically constrained solution algorithm is also developed. Employing this algorithm, the results of several numerical benchmarking studies are presented which illustrate the capacity of the moving updated Lagrangian formulation as well as the potential effects of nonlinearity. (46 refs.)

118530 Contact problem for elastic bodies with circular boundaries at the onset of wear. M.I.Teplii.
Dopov. Akad. Nauk UkRSR. Ser. A (USSR), no.9, p.36-40 (1983). In Ukrainian.
An effective approach is suggested to solution of a problem on internal compression of elastic cylindrical bodies with wear. The solution is given for the case of a nonlinear law of wear. Formulas are found for determining the contact angle, contact pressure and wear of contiguous bodies. (4 refs.)

118531 Adhesive contact of sectionally smooth-ended punches on elastic half-spaces: theory and experiment. D.Maugis, M.Barquins (Lab. Central des Ponts et Chaussees, CNRS, Paris, France).
J. Phys. D (GB), vol.16, no.10, p.1843-74 (14 Oct. 1983).
Attractive molecular forces give rise to singular tensile stresses and to a discontinuity of displacement at the edge of contacts. These boundary conditions are those of fracture mechanics and correspond to adding a rigid body displacement to the classical elastic solution. The adhesive contact of sectionally smooth-ended punches (sphere or cone) is studied. Stress distribution, shape of the deformed surface, and relation between load and penetration are given either for equilibrium or kinetic conditions. For a flat-ended sphere, the adherence of a flat punch and the JKR theory for sphere are obtained as particular cases; for zero surface energy systems, the solution reduces to that of Ejike. The case of a sphere with a spherical cap of different radius and that of a rounded cone are also examined. Experimental verification has been performed with a glass ball (R=2.19 mm and flats between 100 and 240 μm radius) on polyurethane. Radii of contact, penetration and kinetics of detachment agree with the theory within 2%. (17 refs.)

118532 Problem of intersection of two half-planes with reinforced edges. B.V.Kalashnikov, Yu.I.Kudishin.
Mech. Solids (USA), vol.18, no.1, p.66-74 (1983). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela,* vol.18, no.1, p.73-81 (1983).
By employing the method of linear conjugation the authors solve a contact problem of elasticity. The principal singular integral equation on a semiinfinite interval is solved by an approximate method based on the use of Laguerre polynomials. The authors investigate the behaviour of the unknown function at the zero point and at a point at an infinite distance, and aspects of numerical implementation of the method. As an example, calculations are performed for a crane girder. Theoretical results are compared with experimental data. (6 refs.)

118533 One solution of the contact problem of nonlinear steady creep for a half-plane. V.M.Aleksandrov, M.A.Sumbatyan.
Mech. Solids (USA), vol.18, no.1, p.99-105 (1983). Translation of: *Izv. Akad. Nauk SSSR Mekh. Tverd. Tela,* vol.18, no.1, p.107-13 (1983).
Proposes a new approach to the contact problem of indentation of a rigid die into a half-plane whose material is under conditions of steady power-law creep. The approach is based on joining the solution valid in the entire region except for the neighborhood of the corners of the die to the solution valid near the corners. The authors determine the sizes of the zones of the 'local' and 'global' solutions, and obtain the relationship between the indenting force and the settling of the die. (7 refs.)

118534 Nonlocal and nonlinear friction laws and variational principles for contact problems in elasticity. J.T.Oden, E.B.Pires (Dept. of Aerospace Engng. & Engng. Mech., Univ. of Texas, Austin, TX, USA).
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.1, p.67-76 (March 1983). [received: Oct. 1983]
The use of the classical Coulomb law of friction in the formulation of contact problems in elasticity leads to both physical and mathematical difficulties; the former arises from the fact that this law provides a poor model of frictional stresses at points on metallic surfaces in contat, and the latter is due to the fact that the existence of solutions of the governing equations can be proved only for very special situations. Nonclassical friction laws are proposed in an attempt to overcome both of these difficulties. The authors consider a class of contact problems involving the equilibrium of linearly elastic bodies in contact on surfaces on which nonlocal and nonlinear friction laws are assumed to hold. The physics of friction between metallic bodies in contact is discussed and arguments in support of the theory are presented. Variational principles for boundary-value problems in elasticity in which such nonlinear nonlocal laws hold are then developed. A brief discussion of the questions of existence and uniqueness of solutions to the nonlocal and nonlinear problems is given. (12 refs.)

118535 Further developments in in-plane strain measurement of rotating structures. R.W.T.Preater (Dept. of Mech. Engng., City Univ., London, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.591-4 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
An experimental technique which combines the accuracy of holographic interferometry and the ease of a television video display which may be used under service conditions for in-plane strain measurement is extremely attractive. Electronic speckle pattern interferometry (ESPI) is a technique which displays this potential and development for application to rotating structures is at present taking place at The City University. The latest results achieved showing interference fringes recorded at tangential velocities up to nearly 5 ms^{-1} are presented. (4 refs.)

118536 Effect of specimen thickness on Mode I stress intensity factor in photoelastic investigations. N.Srinivasa Murthy, N.Rakesh, L.S.Srinath (Dept. of Mech. Engng., Indian Inst. of Sci., Bangalore, India).
Eng. Fract. Mech. (GB), vol.18, no.6, p.1201-5 (1983).
Reports results pertaining to the acceptable thickness of slice necessary to obtain a satisfactory value for stress intensity factors from photoelastic data, and to the domain within which the observed photoelastic data give reasonably consistent values for stress intensity factors. (5 refs.)

118537 Application of a new velocity gage to fraction at high crack velocities. P.Beguelin, B.Stalder, H.H.Kausch (Lab. de Polymeres, Ecole Polytech. Federale de Lausanne, Lausanne, Switzerland).
Int. J. Fract. (Netherlands), vol.23, no.1, p.R7-10 (Sept. 1983).
A new velocity gage has been described by Stalder et al., (see ibid., vol.22, p.R47, 1983), which uses a layer of graphite particles applied by spraying and bound by two silver electrodes. The general possibilities offered by the new gage in impact loading studies are discussed. (5 refs.)

118538 Modal balancing of flexible rotors without test runs: an experimental investigation. P.Gnielka (Inst. fur Luft- und Raumfahrt, Tech. Univ. Berlin, Berlin, Germany).
J. Sound & Vib. (GB), vol.90, no.2, p.157-72 (22 Sept. 1983).
In all methods of balancing flexible rotors currently in use (modal balancing and influence coefficient techniques) test masses and test runs are required for the calculation of correctiom masses. In the modal balancing procedure suggested by Gasch and Drechsler [1978] a simple identification method is used to find the generalized unbalances without test runs. The Gasch and Drechsler balancing procedure is reported and extended to multibearing rotors with initial shaft bow. Systematic experiments done on two test rotors are described. The results show that flexible shafts mounted in ball bearings can be balanced with very good results. Even rotors in fluid film bearings, exceeding the scope of modal theory, were balanced with good results. (13 refs.)

118539 Predicting the creep of unidirectional reinforced plastic with thermorheologically simple structural components. R.D.Maksimov, E.Z.Plume (Inst. of Polymer Mech., Acad. of Sci., Riga, Latvian SSR).
Mech. Compos. Mater. (USA), vol.18, no.6, p.737-44 (Nov.-Dec. 1983). Translation of: *Mekh. Kompozitnykh Mater. (USSR),* vol.18, no.6, p.1081-9 (Nov.-Dec. 1982). [received: Sept. 1983]
Investigates the possibility of the staged prediction of the viscoelastic properties of a composite, the structural components of which can be considered thermorheologically simple bodies: first to perform accelerated tests on the components and to predict their viscoelastic properties, and then, using prediction data and structural models, to determine by computational means the long-term viscoelastic properties of the composite with allowance for the structure of the reinforcement. (17 refs.)

118540 On a curvature based non-destructive moire technique for detecting defects in plates. G.Subramanian, S.Krishnakumar (Dept. of Aeronaut. Engng., India Inst. of Technol., Madras, India).
NDT Int. (GB), vol.16, no.5, p.271-4 (Oct. 1983).
Curvature contouring of laterally loaded reflective plates is shown to be an effective means of detecting defects. A sensitive moire method is proposed which uses an image-shearing technique to obtain at the image plane a dense slope-modulated virtual grating which, when superposed upon itself with a lateral shift, yields explicit partial curvature fringes. The method enables the determination of the location and also the size and shape of the defect. (6 refs.)

118541 Holographic interferometry in vibration measurements. P.Hynna. **Report 185**, Tech. Res. Centre Finland, Occupational Safety Eng. Lab., Espoo (May 1983), 91 pp. In Finnish.
The aim of the literature review was to consider the use of holographic interferometry in vibration measurements. Holographic interferometry is interferometric comparison of two or more waves, at least one of which is holographically reconstructed. At the beginning of this review basic optics and holography, which are needed to describe holographic interferometry, are presented. Vibration measurement in the case of sinusoidal vibration, separable motions, multiple motions and nonseparable motions are presented. Real-time and stroboscopic holographic interferometry, temporally modulated holography, the use of sandwich-holograms in vibration measurements and the measurement of vibration phase are considered. The optical image derotation developed to study rotating objects is presented. Speckle photography and speckle interferometry, which are nearly related and complementary to holographic interferometry, are discussed. Basic features of industrial applications and equipment are presented and safety risks of lasers are briefly discussed. (100 refs.)

46.60 RHEOLOGY OF FLUIDS AND PASTES

118542 Rheological properties of nonaqueous polystyrene dispersions. Z.T.Il'ina, I.A.Ageeva, M.T.Bryk (Inst. of Colloid Chem. & of the Chem. of Water, Acad. of Sci., Kiev, Ukrainian SSR).
Colloid J. USSR (USA), vol.44, no.6, p.916-20 (Nov.-Dec. 1982). Translation of: *Kolloidn. Zh. (USSR)*, vol.44, no.6, p.1039-43 (Nov.-Dec. 1982). [received: Sept. 1983]
Substantial differences in the rheological behavior of polystyrene dispersions prepared by different methods have been established. It is shown that the lyophilization of the surface of dispersed particles of polystyrene obtained by polymerization is attributable to the entrapment of silicone rubber macromolecules by the polystyrene particles during their nucleation and growth. (5 refs.)

118543 Master surfaces of viscoelastic functions in the reciprocal temperature-frequency space. I. Basic considerations. M.-J.Brekner, H.-J.Cantow, H.A.Schneider (Inst. fur Makromoleculare Chem., Univ. Freiburg, Freiburg, Germany).
Polym. Bull. (Germany), vol.10, no.7-8, p.328-35 (Sept. 1983).
Starting from Eyring's transition state theory (1941) it is demonstrated for systems obeying the superposition principle that the frequency shift factors of isotherm mastercurves of the viscoelastic functions as well as the temperature shift factors of the isochrone ones are unequivocally interrelated with the apparent activation energy of flow. The method for the evaluation of the activation energy from viscoelastic data is discussed, considering the moduli surfaces in the reciprocal temperature-frequency space. Experimental data prove the reliability of the approach. It is demonstrated that it is much more suitable to construct mastercurves as well as master surfaces in this way, because it is not necessary to apply measurements at low frequencies, which are unavoidable when the curves are constructed by empirical shift in the usual way. (7 refs.)

47.10 GENERAL THEORY

(see also 03.40G Mathematical aspects)

118544 Numerical experiments with the Osher upwind scheme for the Euler equations. S.R.Chakravarthy (Stanford Univ., Stanford, CA, USA), S.Osher.
AIAA J. (USA), vol.21, no.9, p.1241-8 (Sept. 1983).
The Osher algorithm for solving the Euler equations is an upwind finite difference procedure that is derived by combining the salient features of the theory of conservation laws and the mathematical theory of characteristics for hyperbolic systems of equations. A first-order accurate version of the numerical method was derived by Osher circa 1980 for the one-dimensional nonisentropic Euler equations in Cartesian coordinates. In this paper, the extension of the scheme to arbitrary two-dimensional geometries is explained. Results are then presented for several example problems in one and two dimensions. Future work will include extension of the method to second-order accuracy and the development of implicit time differencing for the Osher algorithm. (20 refs.)

118545 Mathematical models and computing algorithms for the flow of a viscous fluid. N.N.Yanenko.
Cybernetics (USA), vol.18, no.6, p.715-22 (Nov.-Dec. 1982). Translation of: *Kibernetika (USSR)*, vol.18, no.6, p.17-22 (Nov.-Dec. 1982). [received: Sept. 1983]
Describes the mathematical characteristics of Navier-Stokes equations in cartesian coordinates. Also discussed is the correspondence between the structure of a total algorithm and the architecture of a computer. (15 refs.)

118546 Hydrodynamic and mass transfer characteristics of polypropylene multifilament wire gauze packings. K.Niranjan, V.G.Pangarkar (Dept. of Chem. Technol., Univ. of Bombay, Bombay, India).
Chem. Eng. J. (Switzerland), vol.27, no.1, p.49-57 (Aug. 1983).
Hydrodynamic and mass transfer characteristics of regular polypropylene multifilament wire gauze packings are presented. These packings can be conveniently used to handle corrosive systems. The gas side pressure drop and static and dynamic holdup values were determined for an air-water system. The theory of gas absorption accompanied by a pseudo-mth-order reaction was used to determine the values of the effective interfacial area a, the liquid side mass transfer coefficient k_La and the gas side mass transfer coefficient k_Ga. The values of a are strongly influenced by the type of distributor used. With an improved liquid distributor, a relatively good turndown is obtained. The a values are almost double the a values for conventional packings. True k_L values appear to be higher than those for conventional packings because of increased turbulence caused by the packings. The k_La and k_G a data were correlated with V_L and V_G. (18 refs.)

118547 The well-posedness of two-dimensional ideal flow. C.Sulem, P.Sulem (Dept. de Math., Univ. de Nice, Nice, France).
J. Mec. Theor. & Appl. (France), spec, suppl., p.217-42 (1983).
Presents a review of mathematical results concerning well-posedness of the Euler equation for an ideal fluid in two dimensions. When the vorticity is initially bounded (in Holder norm), there exists for all time a unique solution which remains as smooth as the initial data (Wolibner, 1933). This condition is not satisfied in the context of the Kelvin-Helmholtz instability where the initial velocity is discontinuous through a vortex sheet. In the latter case, existence for a short time of the vortex sheet is ensured only if the sheet and the vorticity density are initially analytic. Asymptotic analysis (Moore, 1979) and numerical simulations (Meiron, Baker and Orszag, 1982) suggest that a singularity in the vortex sheet develops in a finite time. Existence of the flow at all times is then ensured only in a weak sense. The emphasis is on an elementary presentation of the methods. The authors have tried to bring out the cores of the proofs (mainly a priori estimates), leaving out some technical details. (50 refs.)

118548 On integrals and invariants for inviscid, irrotational flow under gravity. M.S.Longuet-Higgins (Dept. of Appl. Maths. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).
J. Fluid Mech. (GB), vol.134, p.155-9 (Sept. 1983).
Simplified proofs are given of the eight basic conservation laws for two-dimensional irrotational flow of a perfect fluid. The corresponding relations for rotational flow are also discussed. (3 refs.)

118549 Grain flow as a fluid-mechanical phenomenon. P.K.Haff (Div. of Phys., Maths. & Astron., California Inst. of Technol., Pasadena, CA, USA).
J. Fluid Mech. (GB), vol.134, p.401-30 (Sept. 1983).
The behaviour of granular material in motion is studied from a continuum point of view. In so far as possible, individual grains are treated as the 'molecules' of a granular 'fluid'. Besides the obvious contrast in shape, size and mass, a key difference between true molecules and grains is that collisions of the latter are inevitably inelastic. This, together with the fact that the fluctuation velocity may be comparable to the flow velocity, necessitates explicit incorporation of the energy equation, in addition to the continuity and momentum equations, into the theoretical description. Simple 'microscopic' kinetic models are invoked for deriving expressions for the 'coefficients' of viscosity, thermal diffusivity and energy absorption due to collisions. The 'coefficients' are not constants, but are functions of the local state of the medium, and therefore depend on the local 'temperature' and density. In general the resulting equations are nonlinear and coupled. However, in the limit $s \ll d$, where s is the mean separation between neighbouring grain surfaces and d is a grain diameter, the above equations become linear and can be solved analytically. (19 refs.)

118550 Potential flow around two dimensional isosceles triangular cylinder subjected to uniform flow from base surface. T.Nagashima (Dept. of Aeronautical Engng., Nat. Defense Acad., Yokosuka, Japan), T.Hirose.
Sci. & Eng. Rep. Natl. Def. Acad. (Jpn.) (Japan), vol.20, no.4, p.435-42 (Dec. 1982). In Japanese. [received: Sept. 1983]
The theoretical velocity distribution of an ideal flow around the isosceles triangular cylinder subjected to uniform flow from its base surface is presented by using the conformal mapping method developed by Lighthill (1945) and Hay (1956). The velocity distribution is very different from the one for actual flow in which flow separations from edges predominate; however, it still provides a useful reference for experimental investigations. 47.15 LAMINAR FLOWS

118551 The two-dimensional laminar wake with initial asymmetry. A.Demetriades (Montana State Univ., Bozeman, MT, USA).
AIAA J. (USA), vol.21, no.9, p.1347-9 (Sept. 1983).
A frequent problem in laser cavity flows, airfoil aerodynamics, and similar two-dimensional fluid problems is the mixing of two identical uniform, compressible streams past a sharp trailing edge (TE) of a partition, on one side of which the laminar boundary layer is thicker than it is on the other. Since the streams are identical this configuration resembles an ordinary two-dimensional wake; however, the disparity in the boundary-layer thicknesses is bound to introduce asymmetries in the flow, especially beyond but near the trailing edge. The distance beyond the latter over which such asymmetries persist is of significance, especially if no restrictions are placed on the flow Mach number M_e and the temperature ratio T_w/T_{oe} of the solid partition relative to the stagnation temperature of the stream. The author aims at presenting formulas valid for such an asymmetric wake for any M_e and T_w/T_{oe} and any degree of asymmetry introduced via the ratio $P=\theta_1/\theta_2$, where θ is the boundary-layer momentum thickness at the trailing edge and subscripts 1 and 2 refer to the two sides of the partition. (7 refs.)

118552 An interferometric investigation of separated forced convection in laminar flow past cavities. W.Aung (Dept. of Mech. Engng., Howard Univ., Washington, DC, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.505-12 (Aug. 1983).
This study concerns the separated, laminar forced convection in cavities located on a flat plate in a low-speed wind tunnel. Temperature profiles and local heat transfer coefficients are measured by means of a Mach-Zehnder interferometer. With all walls maintained at a uniform temperature, experiments are conducted for cavity aspect ratios (length divided by depth) $w/s=4$ and $w/s=1$ at different Reynolds numbers. Results show that the temperature distribution outside of the cavity is little influenced by flow in the cavity. The local heat transfer distribution on the cavity floor attains a maximum value that is located between the midpoint of the cavity floor and the downstream wall. Everywhere on the cavity floor, the local heat transfer is substantially less than the value upstream of the cavity. Compared with attached flow obtained by setting the cavity depth to zero, the average heat transfer on the cavity floor is more than a factor of two lower for $w/s=4$ and more than an order of magnitude lower for $w/s=1$. 47.20 HYDRODYNAMIC STABILITY

118555 A discrete vortex simulation of Kelvin-Helmholtz instability. I.G.Bromilow, R.R.Clements (Univ. of Bristol, Bristol, England).
AIAA J. (USA), vol.21, no.9, p.1345-7 (Sept. 1983).
At the interface between two flows of different density and velocity, there is a generation of vorticity which must be included when calculating the development of the interface. In the past, models have been presented which include a time variation of vorticity due to buoyancy and/or surface tension effects but the resulting numerical schemes were either complicated or else limited the development of the vortex sheet to early times. Zalosh (1976) applied the discrete vortex method to the study of Kelvin-Helmholtz instability. This technique approximates a continuous distribution of vorticity by a set of discrete vortices, whose subsequent motion enables the motion of the vortex sheet to be inferred. The singularity in the velocity field of a point vortex is associated with a growing randomness of the discrete vortices with their close approach. According to Zalosh, this was responsible for the inaccuracies in his calculations. The authors have presented techniques for reducing this irregular movement. (10 refs.)

118556 Finite amplitude evolution of mixing layers in the presence of solid boundaries. P.Huerre (Dept. of Aerospace Engng., Univ. of Southern California, Los Angeles, CA, USA).
J. Mec. Theor. & Appl. (France), spec, suppl., p.121-45 (1983).
The linear and nonlinear stability theory of two-dimensional free shear layers is briefly reviewed. The author then analyses in detail the situation where an antisymmetric velocity profile is bounded by parallel solid walls. If δ denotes the ratio of the separation distance between the two walls and the thickness of the layer, the flow first becomes linearly unstable at zero wavenumber above a certain critical value δ_c. The author shows that the nature of the amplitude equation governing the nonlinear development of long-wavelength instability waves around δ_c depends on the order of magnitude of the critical layer Reynolds number R_{cl}. In the viscous critical layer regime ($R_{cl}\ll 1$), the evolution equation is integro-differential and reflects the nonanalyticity of the dispersion relation at zero wavenumber. In the purely nonlinear critical layer regime ($R_{cl}=\infty$), the evolution equation reduces to the Boussinesq equation. Although the underlying dispersion relations are different in each case, both equations admit identical solitary wave solutions. (48 refs.)

118557 Instabilities of a cylindrical liquid sheet between two gas streams. J.Martinon (Ecole Nat. Superieure des Mines de Paris, Paris, France).
J. Mec. Theor. & Appl. (France), vol.2, no.4, p.629-41 (1983). In French.
Presents results on the linear stability of a cylindrical liquid sheet between two gas streams, when the three velocity fields have both axial and tangential components. For a given wavenumber in the axial direction, the pulsation of a perturbation with period $2\pi/n$ in the tangential direction must satisfy a fourth degree equation with real coefficients. Detailed results are given for thin sheets; only the difference between gas velocity fields influence the stability. For small tangential component difference values, the dominant instability is axisymmetric, but this is no longer the case when this difference is more important. (10 refs.)

118558 Numerical solution of a Rayleigh-Taylor instability problem. J.Geydanus, H.Rasmussen (Dept. of Appl. Math., Univ. of Western Ontario, London, Ontario, Canada).
J. Comput. & Appl. Math. (Netherlands), vol.9, no.2, p.97-103 (June 1983).
The numerical solution of a Rayleigh-Taylor instability problem where an inviscid liquid of finite depth is accelerated into a gas of semi-infinite extent is obtained by transforming the irregular flow domain into a rectangular domain by a coordinate transformation. The free surface equation is solved by a Crank-Nicholson procedure. The boundary condition at the free surface for the velocity potential ϕ which contains the time derivative of ϕ is also treated by an implicit scheme. The numerical results agree well with those obtained by higher order perturbation analysis. (7 refs.)

118559 Unsteady incompressible flow at a three-dimensional stagnation point with large injection rates. C.D.Surma Devi, G.Nath (Dept. of Appl. Math., Indian Inst. of Sci., Bangalore, India).
Indian J. Technol., vol.21, no.3, p.94-100 (March 1983). [received: Oct. 1983]
The self-similar solution of the unsteady laminar incompressible boundary-layer flow at a three-dimensional stagnation point for both nodal and saddle point regions has been obtained when the free stream velocity and the square of the mass transfer (injection) vary inversely as a linear function of time. The equations governing the flow have been solved numerically using an implicit finite-difference scheme in combination with the quasilinearization technique for nodal points of attachment but employing parametric differentiation technique instead of quasilinearization for saddle points of attachment. The unsteadiness in the free stream velocity is found to have strong influence on both the velocity and temperature fields, but Prandtl number affects only the temperature field and large Prandtl number gives rise to temperature overshoot in the saddle-point region in the presence of large injection. The velocity component in the y direction shows flow reversal in the saddle point region for accelerating flow but both flow reversal and velocity overshoot for decelerating flow, and the region of reverse flow increases with injection rate. Also, the dividing streamline is pushed away from the boundary due to injection. (27 refs.)

118560 A numerical method for potential flows with a free surface. A.Prosperetti (Istituto di Fisica, Univ. di Milano, Milano, Italy), J.W.Jacobs.
J. Comput. Phys. (USA), vol.51, no.3, p.365-86 (Sept. 1983).
A finite-difference numerical method for an accurate and efficient solution of transient potential flow problems with a free surface is described and illustrated with application to the Rayleigh-Taylor instability and the expulsion of liquid from a pipe immersed in a tank. The novel feature of the method consists of the adoption of special differentiation formulae to calculate the liquid velocity at the free surface with much greater accuracy and stability than previously possible. (26 refs.)

118561 Spinning modes on axisymmetric jets. I. P.J.R.Strange, D.G.Crighton (Dept. of Appl. Math. Studies, Univ. of Leeds, Leeds, England).
J. Fluid Mech. (GB), vol.134, p.231-45 (Sept. 1983).
Linear instability analysis is applied to the slowly diverging mean profile of a turbulent axisymmetric jet and used to predict the transverse structure and axial evolution of large-scale wavelike modes with azimuthal wavenumber $m=1$. Comparisons are made with measurements of filtered velocity fluctuations, and of pressure fluctuations, taken in a jet with coherent forcing at the exit plane, at Strouhal numbers $St=fD/U_0$ around 0.5, $f=\omega/2\pi$ being the frequency, D the nozzle diameter and U_0 the mean centreline exit velocity. The transverse structure at each axial station is well predicted by linear theory, as is the phase speed and its variation with axial distance. The downstream evolution of amplitude is much less well predicted, presumably because of cumulative nonlinear effects in the experiments, though the inclusion of mean-flow divergence itself constitutes a significant improvement over the theory for parallel flow. (26 refs.)

47.25 TURBULENT FLOWS, CONVECTION, AND HEAT TRANSFER

118562 Introduction to two-dimensional turbulence. M.Lesieur (Inst. de Mecanique de Grenoble, Grenoble, France).
J. Mec. Theor. & Appl. (France), spec, suppl., p.5-20 (1983). In French.
After discussing the validity of the concept of two-dimensional turbulence the author examines conditions under which a quasitwo-dimensional turbulence may be obtained; flows submitted to a rapid rotation, such as large scale atmosphere and oceanic motions, MHD flows submitted to a strong magnetic field, mixing layers, and stratified flows. A brief review of spectral theories of forced two-dimensional turbulence is presented, with a discussion about the notion of negative eddy-viscosity. The author then looks at the dynamics of a freely-evolving turbulence, without any injection of energy due to external forces. In the latter case the author discusses the concept of an enstrophy 'pseudo-catastrophe' at a finite time, introduced by Tatsumi and Vanase (1981). This time could be related to the time after which a mixing layer flow becomes three-dimensional in the small scales. Finally it is shown through quasigeostrophic theory how the interaction of Rossby waves and turbulence could explain the zonal structure of the Jovian atmosphere. (34 refs.)

118563 The prevalence of two-dimensional motion in the turbulent mixing layer. G.M.Corcos (Dept. of Mech. Engng., Univ. of California, Berkeley, CA, USA).
J. Mec. Theor. & Appl. (France), spec, suppl., p.147-67 (1983).
Experimental evidence suggests that in the turbulent mixing layer the fundamental mechanism of growth is two-dimensional and little affected by the presence of vigorous three-dimensional motion. To quantify this apparent property and study the growth of streamwise vorticity, the author represents the velocity field as: $\underline{V}(\underline{x},t)=\underline{U}(x,z,t)+\underline{u}(x,y,z,t)$ where $\underline{U}$ is two-dimensional and $\underline{u}$ is three-dimensional. In a first version of the problem $\underline{U}$ is independent of $\underline{u}$ while in the second $\underline{U}$ is the spanwise average of $\underline{V}$. In both cases the equation for $\underline{u}$ is linearized around $\underline{U}$. The equations for $\underline{U}$ and $\underline{u}$ are solved simultaneously by a finite difference calculation starting with a slightly disturbed parallel shear layer. The solutions offer details of the growth of the three-dimensional motion, and show that its energy is narrowly localized. Comparison of the two cases shows that even large amplitude three-dimensional motions have a negligible effect on the rate of coalescence of the spanwise vortices and thus on the growth of layer. (12 refs.)

118564 Modelling of virtual scales in numerical simulation of two dimensional turbulent flows. C.Basdevant, R.Sadourny (Lab. de Meteorologie Dynamique, Ecole Normale Superieure, Paris, France).
J. Mec. Theor. & Appl. (France), spec, suppl., p.243-69 (1983). In French.
Strictly speaking, direct numerical simulation of turbulent flows necessitates a mesh size of the order of the dissipation scale. Therefore, only comparatively low Reynolds numbers can be attained. However, if one admits that the structure of turbulent flows at macroscales is independent of the deterministic behaviour of dissipative microstructures, one can hope to simulate it using relatively low-resolution models, provided that the statistical effect of subgrid scales on resolved scales is adequately modelled. In the case of a two-dimensional turbulence model with a cut-off wavenumber in the enstrophy-cascading range, this subgridscale modelling is essentialy reducible to a proper representation of the cascade process. The classical approach is to use non-linear diffusion operators more or less heuristically defined. More recently, statistical methods involving the classical phenomenological theory of the inertial range have been proposed. A major drawback of the latter approach is its dependence on a tentative phenomenological model. The authors show that the occurrence of intermittency in two-dimensional turbulence must lead to a different phenomenology, involving spectral slopes markedly steeper that those expected from the classical theory. In view of this uncertainty concerning the choice of a proper phenomenological model, the authors come to the conclusion that subgridscale modelling should be based on generic properties of the original equation. Two different approaches following this strategy are presented. (21 refs.)

118565 'Statistical helicity invariant' and decay of inertial turbulence. A.Frenkel, E.Levich (Inst. of Appl. Chem. Phys., City Univ. of New York, New York, NY, USA).
Phys. Lett. A (Netherlands), vol.98A, no.1-2, p.25-7 (3 Oct. 1983).
A new ('three-range-spectrum') model is suggested for freely evolving homogeneous turbulence with high Reynolds numbers, in connection with the recently shown (approximate) conservation of density of mean-square helicity. The corresponding power law of energy decay is slower than in conventional two-range models. (11 refs.)

118566 Fractional analysis of Reynolds stress distribution in complex shear flows. H.Dumitrescu, S.T.N.Savulescu (Increst, Bucharest, Rumania).
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.2, p.139-57 (March-April 1983). [received: Sept. 1983]
Following their theory (1981) the authors analyze the relation $u'\eta'=\nu_T{}^{\delta U}/_{\delta y}$ for the complex shear flows involving separation, relaxation (recirculating) flows. Physically ν_T-distribution scales with h-distribution even in such flows. A new expression for $h^*(U_a)$ was proposed which agrees with experimental data for nearly equilibrium flows. Concerning the value of ν_{Tmax} in these complex flows, especially in the reattaching region, it strikingly deviates from the values of equilibrium shear layers. (9 refs.)

118567 Prediction of separated asymmetric trailing-edge flows at transonic mach numbers. C.C.Horstmann (NASA Ames Res. Center, Moffett Field, CA, USA).
AIAA J. (USA), vol.21, no.9, p.1255-61 (Sept. 1983).
Numerical simulations of the time-dependent, Reynolds-averaged, Navier-Stokes equations, employing various eddy viscosity turbulence models are presented and compared with measurements from an investigation of a transonic trailing-edge flow at a high Reynolds number. Comparisons are made for mean surface quantities as well as mean and fluctuating flowfield quantities. Solutions employing two-equation turbulence models correctly predict all the major features of the flowfield. Viscous/inviscid interaction effects were found to be extremely important for predicting this flowfield and equally important to the turbulence modelling employed. (17 refs.)

118568 Boundary-layer and turbulence intensity measurements in a shock wave/boundary-layer interaction. S.Raghunathan, R.J.W.McAdam (Queen's Univ. of Belfast, Belfast, N Ireland).
AIAA J. (USA), vol.21, no.9, p.1349-50 (Sept. 1983).
Previous work by the authors has shown that attached turbulent boundary layers at zero pressure gradient are sensitive to the freestream turbulence. The effect of freestream turbulence on the boundary layer at positive pressure gradients is very little understood. The authors investigate the influence of freestream turbulence on shock induced separation. (6 refs.)

118569 Influence of two-dimensional turbulence on diffusion. M.Larcheveque (Lab. de Meteorologie Dynamique, Ecole Normale Superieure, Paris, France).
J. Mec. Theor. & Appl. (France), spec, suppl., p.271-92 (1983). In French.
The authors show that the laws about contaminant cloud diffusion on particle pair dispersion in a forced stationary two-dimensional turbulence are still valid for free-decaying two-dimensional turbulence. Experimental diffusion measurements in quasi two-dimensional turbulent flows satisfy these laws and a numerical value for a universal diffusion constant is proposed. Some conjectures about the predictability of free-decaying two-dimensional turbulent flows are deduced from these diffusion laws. A brief comparison is made with the three-dimensional case. (51 refs.)

118570 Multiple scale concept in turbulence modelling. II. Reynolds stresses and turbulent fluxes of a passive scalar, algebraic modelling and simplified models using the Boussinesq hypothesis. R.Schiestel (Inst. de Mecanique Statistique de la Turbulence, Marseille, France).
J. Mec. Theor. & Appl. (France), vol.2, no.4, p.601-28 (1983). In French.
For pt.I see ibid., vol.2, no.3, p.417 (1983). Modelling of Reynolds stresses and turbulent fluxes of a passive scalar contaminant is studied using multiple scales concepts. The analysis introduced in part I, which was based on the spectral equations in homogeneous anisotropic turbulence, is extended and completed. Interpretation in physical space is also considered. Algebraic multiscale modeling possibilities are examined along with a simplified model based on the Boussinesq hypothesis of eddy viscosity. To illustrate the method, the problem of turbulent transfer is treated for two very different situations: turbulent free jets and heat diffusion in grid turbulence. (22 refs.)

118571 Turbulence induced change in the conformation of polymer molecules. R.Armstrong, M.S.Jhon (Dept. of Chem. Engng., Carnegie-Mellon Univ., Pittsburgh, PA, USA).
J. Chem. Phys. (USA), vol.79, no.6, p.3143-7 (15 Sept. 1983).
An investigation into the conformation of a polymer molecule exposed to a stochastic flow field is made utilizing a cumulant expansion. The study begins by considering the full Kirkwood-Riseman *n*-bead chain with an arbitrary connector potential as a model for the polymer molecule, digressing to the two-bead dumbbell molecule for detailed calculations. It is found that the effect of the stochastic velocity field on the molecule can be interpreted as a 'renormalization' of the connector potential. The introduction of this renormalized potential greatly simplifies the mathematics and lends an intuitive understanding to the effect of the turbulence on the polymer. It is shown that this analysis will recover the anomalous tendency of the radius of gyration to become infinite for the special case of a Hookean potential which has been observed by previous investigators. Further, this study involves the Eulerian velocity-velocity correlation function rather than the Lagrangian correlation used in the previous studies. (10 refs.)

118572 On the organized motion of a turbulent plane jet. R.A.Antonia, L.W.B.Browne, S.Rajagopalan, A.J.Chambers (Dept. of Mech. Engng., Univ. of Newcastle, Newcastle, NSW, Australia).
J. Fluid Mech. (GB), vol.134, p.49-66 (Sept. 1983).
Measurements of space-time correlations of longitudinal and normal velocity fluctuations and of temperature fluctuations support the existence of counter-rotating spanwise structures appearing alternately on opposite sides of the jet centreline in the self-preserving region of the flow. The frequency of these structures closely satisfies self-preservation. The asymmetric arrangement of the structures is first observed downstream of the position where the jet mixing layers nominally merge but upstream of the onset of self-preservation. Closer to the jet exit, the space-time correlations indicate the existence of spanwise structures that are symmetrical about the centreline. (35 refs.)

118573 The destruction of temperature fluctuations in a turbulent plane jet. R.A.Antonia, L.W.B.Browne (Dept. of Mech. Engng., Univ. of Newcastle, Newcastle, NSW, Australia).
J. Fluid Mech. (GB), vol.134, p.67-83 (Sept. 1983).
The transport equation for the destruction of temperature fluctuations in a turbulent shear flow is briefly discussed from the point of view of the experimenter's ability to measure the important terms. The transport equation for only one component of the destruction, the mean-square streamwise temperature derivative, is considered in detail in the case of a steady two-dimensional turbulent shear flow. Measurements of most of the terms in this equation have been made in the self-preserving region of a turbulent plane jet. They indicate that the advection and diffusion terms are negligible compared with the production and dissipation terms. The measured terms are discussed in the context of local isotropy. Mean-square values of second-order derivatives satisfy local isotropy more closely than those of first-order derivatives. (27 refs.)

118574 The final stage of decay of turbulence in stably stratified fluid. H.J.Pearson, P.F.Linden (Dept. of Appl. Maths. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).
J. Fluid Mech. (GB), vol.134, p.195-203 (Sept. 1983).
The linearized equations for the final stage of decay of turbulence in a stably stratified fluid are solved by three-dimensional Fourier transformation. For large Prandtl number, slowly decaying almost-horizontal modes of motion are identified. It is argued that these modes explain the experimental observation that patches of turbulence eventually settle out into a set of approximately horizontal striations. The most persistent vertical wavelength for a given

geometry is determined and compared with quantitative observations from a set of experiments. (14 refs.)

118575 Identification of the dynamic characteristics of a simple system with quadratic damping [turbulence]. M.Rades (Polytech. Inst., Bucharest, Rumania).
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.4, p.439-46 (July-Aug. 1983).
Two methods are presented for the estimation of the dynamic parameters of a single degree of freedom system with directly coupled quadratic damping. The required experimental data are a set of polar diagrams of the harmonic response plotted for different (constant magnitude) force excitation level. (9 refs.)

118576 Maldistributed inlet flow effects on turbulent heat transfer and pressure drop in a flat rectangular duct. E.M.Sparrow, N.Cur (Dept. of Mech. Engng., Univ. of Minnesota, Minneapolis, MN, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.527-35 (Aug. 1983).
The effects of flow maldistribution caused by partial blockage of the inlet of a flat rectangular duct were studied experimentally. Local heat transfer coefficients were measured on the principal walls of the duct for two blockages and for Reynolds numbers spanning the range between 6000 and 30000. Measurements were also made of the pressure distribution along the duct, and the fluid flow pattern was visualized by the oil-lampblack technique. Large spanwise nonuniformities of the local heat transfer coefficient were induced by the maldistributed flow. These nonuniformities persisted to far downstream locations, especially in the presence of severe inlet flow maldistributions. Spanwise-average heat transfer coefficients, evaluated from the local data, were found to be enhanced in the downstream portion of the duct due to the flow maldistribution. However, at more upstream locations, where the entering flow reattached to the duct wall following its separation at the sharp-edged inlet, the average coefficients were reduced by the presence of the maldistribution. (8 refs.)

118577 Numerical prediction of wall temperatures for near-critical para-hydrogen in turbulent upflow inside vertical tubes. C.P.Bellmore, R.L.Reid (Dept. of Mech. & Aerospace Engng., Univ. of Tennessee, Knoxville, TN, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.536-41 (Aug. 1983).
Presented herein is a method of including density fluctuations in the equations of turbulent transport. Results of a numerical analysis indicate that the method may be used to predict heat transfer for the case of near-critical para-hydrogen in turbulent upflow inside vertical tubes. Wall temperatures, heat transfer coefficients, and velocities obtained by coupling the equations of turbulent momentum and heat transfer with a perturbed equation of state show good agreement with experiments for inlet reduced pressures of 1.28-5.83. (18 refs.)

118578 Heat transfer mechanisms and performance in multiple parallel disk assemblies. S.Mochizuki, Wen-Jei Yang (Dept. of Mech. Engng. & Appl. Mech., Univ. of Michigan, Ann Arbor, MI, USA), Y.Yagi, M.Ueno.
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.598-604 (Aug. 1983).
Heat transfer and frictional loss performance in radial flow through multiple parallel disk assemblies are experimentally studied by a modified single-blow transient test method. The mechanisms of heat transfer enhancement are determined in the four flow regimes which are characterized by different combinations of flow patterns: pure laminar, laminar-oscillating-laminar, laminar-oscillating-turbulent-laminar, and laminar-oscillating-turbulent type convection. The fifth convective regime is predicted. The results of a condensation-heated disk core are incorporated for discussion and performance comparison. The effects of the disk spacing and size and influx disturbance on the transfer performance are investigated. It is concluded that the disk device has the performance characteristics comparable to high-performance plate-fin type surfaces that are commonly employed in compact heat exchangers. (8 refs.)

118579 On the structure and resolution of wall-pressure fluctuations associated with turbulent boundary-layer flow. G.Schewe (Max-Planck-Inst. fur Stromungsforschung, Gottingen, Germany).
J. Fluid Mech. (GB), vol.134, p.311-28 (Sept. 1983).
In a wind tunnel designed for flow-acoustic measurements, the wall-pressure fluctuations beneath a turbulent boundary layer have been investigated. The measurements were carried out with variously sized pressure transducers ($19 \leq d^+ \leq 333$) and with an array of four small transducers (separation distance $\Delta x^+ = 75$). It is shown that the dimensionless diameter $d^+ = 19$ of the transducers is sufficient to resolve the essential structures of the turbulent pressure fluctuations. The power spectrum $\Phi(\omega^+)$ measured with the smallest transducer $D^+ = 19$ partly exhibits power-law decay $\Phi \sim \omega^{-7/3}$, which has been theoretically predicted for locally isotropic turbulence. By visual analysis and signal averaging in the time domain, pressure structures with high amplitudes could be detected which have the shape of short wavetrains or pulses. Their characteristic frequency and longitudinal wavelength have the mean values $\omega^+ = 0.52$ and $\lambda^+ = 145$ respectively, and their mean convection velocity amounts to $u_c/u_\infty = 0.53$. It was calculated from the measured probability density that these characteristic structures play an important role, although the probability of their occurrence is low. The sources of these wall-pressure structures can be located in the buffer layer of the boundary layer. (23 refs.)

118580 On the gradient flow in a turbulent boundary layer. V.F.Potemkin.
Vestsi Akad. Navuk BSSR Ser. Fiz. Energ. Navuk, no.3, p.56-61 (1983). In Russian.
Using the turbulent boundary layer model, universal relations have been derived for turbulent transfer in a gradient flow. It is shown that the relations obtained allow the simplified calculation of turbulent transfer characteristics for gradient flow. The correlation of theoretical dependences with the known experimental data is quite satisfactory. (7 refs.)

118581 Heat-mass Onsager coefficients in ternary nonelectrolyte liquid mixtures. G.E.Platt, T.Vongvanich, R.L.Rowley (Dept. of Chem. Engng., W.M. Rice Univ., Houston, TX, USA).
J. Non-Equilibrium Thermodyn. (Germany), vol.8, no.1, p.1-18 (1983).
Diffusion thermoeffect experiments have been performed on ternary mixtures of toluene-chlorobenzene-bromobenzene at 298.15K and 308.15K. The temperature profiles obtained in response to isothermal chemical potential gradients have been evaluated in terms of two independent binary heats of transport. Onsager heat-mass coefficients have been computed from the resultant data. Although the heats of transport showed a complex composition dependence, the Onsager coefficients were generally much more planar, exhibiting a strong dependence upon the amount of bromobenzene, the most dense component. Thermal diffusion ratios computed from the Onsager coefficients (by Onsager reciprocity) indicate that the direction of separation of chlorobenzene in pure thermal diffusion separations would change with increasing bromobenzene composition. The Onsager coefficients measured in this study are believed to be the first ternary heat-mass cross coefficients experimentally obtained. They are consistent with the requirements placed upon them by the second law of thermodynamics. (21 refs.)

118582 Unsteady conjugated heat transfer near a stagnation point. D.G.Drake (Dept. of Maths., Southampton Univ., Southampton, England).
Appl. Sci. Res. (Netherlands), vol.40, no.3, p.199-207 (1983).
An analysis is presented for the unsteady thermal processes involved when a plane wall of high thermal conductivity loses heat to a fluid in two-dimensional stagnation point flow against the wall. It is assumed that the rear surface of the wall is insulated and the initial temperature of the wall is greater than that of the fluid. A complete description of the temperature history of the wall is obtained by developing solutions valid for small and large values of the time. (5 refs.)

118583 Study of nonlinear convection in a sparsely packed porous medium using spectral analysis. N.Rudraiah, Balachandra Rao (Dept. of Maths., Bangalore Univ., Bangalore, India).
Appl. Sci. Res. (Netherlands), vol.40, no.3, p.223-45 (1983).
Nonlinear study cellular convection in a sparsely packed fluid saturated porous medium is investigated, considering the Brinkman model using the technique of spectral analysis. It is established how the Brinkman model with free-free boundaries generalizes the study of convection in a porous medium in the sense that it yields the results tending to those of viscous and Darcy flows respectively for very small and very large values of the permeability parameter σ^2. It also provides results for the transition zone (i.e. $10^2 < \sigma < \sigma^2 < 10^3$). The cross-interaction of the linear modes caused by nonlinear effects are considered through the modal Rayleigh number R_γ. The possibility of the existence of steady solution with two self-excited modes in certain regions is predicted. The similarities of present analysis with and advantages over that of the power integral technique are brought out. A detailed discussion of the heat transport, with the effect of permeability thereon, is made. The theoretical values of the Nusselt number are found to be in good agreement with experimental results. (24 refs.)

118584 Numerical solution of natural convection in eccentric annuli. D.W.Pepper, R.E.Cooper (E.I. du Pont de Nemours & Co., Aiken, SC, USA).
AIAA J. (USA), vol.21, no.9, p.1331-7 (Sept. 1983).
The governing equations for transient natural convection in eccentric annular space are solved with two high-order accurate numerical algorithms. The equation set is transformed into bipolar coordinates and split into two one-dimensional equations: finite elements are used in the direction normal to the cylinder surfaces: the pseudospectral technique is used in the azimuthal direction. Transient solutions of the entire flowfield are obtained for $10^2 \leq Ra \leq 10^6$, $0.70 \leq Pr \leq 10^2$, with the inner cylinder near the top, bottom, and side of the outer cylinder. Results are similar to experimental and numerical values previously published for low *Ra* numbers. (26 refs.)

118585 Fluid flow and heat transfer in corrugated wall channels. III. Effects of bending angles in the case where channels are bent two times. R.Izumi, H.Yamashita (Faculty of Engng., Nagoya Univ., Nagoya, Japan), K.Oyakawa, N.Mori.
Bull. JSME (Japan), vol.26, no.216, p.1027-35 (June 1983).
For pt.II see ibid., vol.24, no.198, p.2098 (1981). Corrugated wall channels are investigated as a means of augmenting forced-convection heat transfer with a single-phase flow in heat exchangers. Fluid flow states and heat transfer characteristics of parallel channels bent two times which are fundamental elements of corrugated wall channels are examined by numerical analyses and experiments for the pitch $P=3$ and the bending angle $\theta = 0° \sim 90°$. Consequently, effects of bending angles on aspects of flow, wall shear stress and local Nusselt number distributions, pressure losses and mean Nusselt numbers are clarified, and adequate values of bending angles are examined. (10 refs.)

118586 Free convection around tubes mounted parallel and horizontal to air flow. Analysis of the local coefficient dependence on spacing and temperature. R.Diez Gonzalez (Facultad de Fisicas, Univ. de Valencia, Valencia, Spain), M.Buendia Gomez, M.Dolz Planas.
An. Fis. Ser. B (Spain), vol.79, no.2, p.146-51 (May-Aug. 1983). In Spanish. [received: Oct. 1983]
Using double exposure holography the temperature field around two aluminium cylinders (10.5 cm length and 1 cm diameter) placed horizontal and parallel to the airstream has been investigated. On the basis of the experimental data the local, and average, convection coefficient and Nusselt number

and variation with the temperature and distance have been calculated. (6 refs.)

118587 Convection driven by concentration- and temperature-dependent surface tension. C.L.McTaggart (Dept. of Maths., Univ. of Glasgow, Glasgow, Scotland).
J. Fluid Mech. (GB), vol.134, p.301-10 (Sept. 1983).
Generalizes the linear stability analysis of Pearson for Marangoni instability to the case where surface tension depends on both temperature and solute concentration. The results are expressed in terms of a thermal Marangoni number B_T and a solutal Marangoni number B_S. It is found when $B_S>0$ the onset of instability has the form of stationary convection, while when $B_S<0$ there are circumstances in which the onset of instability is in the form of oscillatory convection. (14 refs.)

118588 Laminar natural convection in an inclined rectangular box with the lower surface half-heated and half-insulated. P.K.-B.Chao (Dept. of Chem. Engng., Univ. of Pennsylvania, Philadelphia, PA, USA), H.Ozoe, S.W.Churchill, N.Lior.
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.425-32 (Aug. 1983).
The pattern of circulation and the rate of heat transfer were determined experimentally and also by three-dimensional, finite-difference calculations for an inclined $2\times1\times1$ rectangular enclosure with a 1×1 segment of the lower 2×1 surface at a uniform temperature, the other 1×1 segment and four side walls insulated, and the upper surface at a lower uniform temperature. As contrasted with an enclosure heated and cooled on the horizontal surfaces, a fluid motion occurs and the rate of heat transfer exceeds that for pure conduction for all temperature differences and orientations. The effects of elevation of the heated and insulated segments were investigated, as well as of inclination about the longer dimension. Despite differences in the Prandtl and Rayleigh numbers, the observed and predicted patterns of circulation are in good agreement, and the measured and predicted rates of heat are in qualitative agreement. (17 refs.)

118589 An experimental study of free convective heat transfer in a parallelogrammic enclosure. N.Seki, S.Fukusako, A.Yamaguchi (Dept. of Mech. Engng., Hokkaido Univ., Sapporo, Japan).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.433-9 (Aug. 1983).
Experimental measurements are presented for free convective heat transfer across a parallelogrammic enclosure with the various tilt angles of parallel upper and lower walls insulated. The experiments covered a range of Rayleigh numbers between 3.4×10^4 and 8.6×10^7, and Prandtl numbers between 0.70 and 480. The fluids used were air, transformer oil and water. It was found that the heat transfer coefficients for tilt angle $\phi=-70$ deg were decreased to be about 1/18 times those for $\phi=0$ deg. Experimental results are given as plots of the Nusselt number versus the Rayleigh number. A correlation equation is given for the Nusselt number, Nu, as a function of ϕ, Pr, and Ra. (22 refs.)

118590 Natural convection heat transfer between bodies and their spherical enclosure. R.E.Powe (Mississippi State Univ., Mississippi State, MS, USA), R.O.Warrington,Jr..
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.440-6 (Aug. 1983).
The natural convective heat transfer phenomena which occur between a body and its spherical enclosure have been experimentally investigated. Bodies of several different shapes were employed, so the results should have broad applicability. New temperature field and heat transfer results, in the form of natural convection from cubical inner bodies to a spherical enclosure, have been combined with previously available enclosure data. By considering all of the data combined, trends in the behavior of the convective heat transfer phenomena have been established, thus enabling a much more reliable analysis of enclosed body problems than is now possible. A very general heat transfer correlation has been developed which predicts the natural convection heat transfer from spheres (concentric and eccentric), cylinders, and cubes to a spherical enclosure with an average deviation of less than 12 percent. (20 refs.)

118591 Heat transfer from a heated pool to a melting miscible substrate. I.Catton, W.A.Brinsfield, S.M.Ghiaasiaan (School of Engng. & Appl. Sci., Univ. of California, Los Angeles, CA, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.447-53 (Aug. 1983).
Melting a miscible substrate by a heated overlying pool of higher density is studied experimentally. The heated pool is either carbon tetrachloride or diiodomethane, and the substrate is frozen benzene. By performing the experiments with heated pools of different densities the effects of pool-to-substrate temperature differences and pool-density to melt-density ratios on melting heat transfer are independently studied. Heat transfer rates are reported as a function of both temperature difference and density ratio. A model is postulated and compared with experimental results. The downward heat flux is found to be essentially independent of temperature differences, while being an increasing function of the density ratio between the pool and the melting solid for large density ratios. For low-density ratios a buoyant plume analysis was used to obtain a correlation. (18 refs.)

118592 Free convection in a vertical annulus with constant heat flux on the inner wall. M.Keyhani, F.A.Kulacki, R.N.Christensen (Dept. of Mech. Engng., Ohio State Univ., Columbus, OH, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.454-9 (Aug. 1983).
Heat transfer measurements are presented for free convection in a vertical annulus wherein the inner cylinder is at constant surface heat flux and the outer cylinder is at constant temperature. Overall heat transfer data are corrected for thermal radiation in the annulus. Rayleigh numbers span the conduction, transition and boundary layer regimes of flow, and average heat transfer coefficients are obtained with air and helium as the working fluids. The range of Rayleigh number is $10^3<\mathrm{Ra}<2.3\times10^6$; the radius ratio is 4.33; and the aspect ratio (cylinder length divided by annular gap) is 27.6. Energy transferred by thermal radiation varies with Rayleigh number and working fluid. With air, thermal radiation can account for up to 50 percent of the heat transfer. With helium, radiation can account for up to 30 percent of the heat transfer rate. (10 refs.)

118593 Onset of convection in a horizontal layer of cold water. J.C.Mollendorf (State Univ. of New York, Amherst, NY, USA), K.H.Jahn.
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.460-4 (Aug. 1983).
Parabolic, cubic, and higher order expressions have been used in previous investigations to relate temperature to density in the vicinity of the density extremum. Another equation of state, based on the careful measurement of the density variations of both pure and saline water, has been used to determine the onset of convection in a horizontally confined layer of water near its density extremum. The simplicity of this equation gives rise to a minimum number of problem particular parameters, and relatively easily allows for the inclusion of both pressure and salinity level effects (neglecting saline diffusion). The boundaries are considered to be rigid-rigid and of infinite thermal capacity. Present numerical results are compared with those previously calculated using other density relationships, including that embodied in the linear Oberbeck-Boussinesq approximation. Density extremum effects are seen to be stabilizing, with critical Rayleigh numbers calculated to be about 10 percent below those obtained using a parabolic density-temperature relationship and quite close to those found using a fifth-order polynomial. There is an associated increase in calculated wave number with the inclusion of density extremum effects. (21 refs.)

118594 Natural convection along a vertical wavy surface. L.S.Yao (Dept. of Mech. & Aerospace Engng., Arizona State Univ., Tempe, AZ, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.465-8 (Aug. 1983).
A transformation method is applied to study the natural convection along irregular vertical surfaces. A sinusoidal surface is used as a specific example to demonstrate the advantages of the transformation method, and to elucidate the heat transfer mechanism near such surfaces. The numerical results show that the frequency of the local heat transfer rate is twice that of the wavy surface. The amplitude of the oscillating local Nusselt number gradually decreases downstream where the natural convection boundary layer grows thick. (3 refs.)

118595 Numerical study of transient high Rayleigh number convection in an attic-shaped porous layer. D.Poulikakos (Dept. of Mech. Engng., Univ. of Illinois, Chicago, IL, USA), A.Bejan.
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.476-84 (Aug. 1983).
Scaling arguments and numerical analysis are used to document the transient and steady-state regimes of natural convection in a triangular porous layer cooled from above (along the sloping wall). The numerical simulations are conducted in the high Rayleigh number domain, Ra=100, 1000, where Ra is the Darcy-modified Rayleigh number based on height, H. The scale analysis predicts the existence of distinct thermal boundary layers if $\mathrm{Ra}^{1/2}$ $(H/L)>1$, where H/L is the height/length geometric ratio of the attic-shaped porous layer. The numerical simulations confirm the scaling results as well as the prediction that the flow consists primarily of an elongated horizontal counterflow driven by the cold wall. In addition, the numerical solutions show the presence of a Benard-type instability at high enough Rayleigh numbers. For example, if $H/L=0.2$, the instability is present when $\mathrm{Ra}>620$; this critical Rayleigh number is found to increase as H/L increases. (12 refs.)

118596 Heat transfer in porous media heated from above with evaporation, condensation, and capillary effects. K.S.Udell (Dept. of Mech. Engng., Univ. of California, Berkeley, CA, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.485-92 (Aug. 1983).
Heat and mass transfer characteristics of a sand-water-steam system heated at the top and cooled at the bottom were studied. It was found that at steady-state conditions the system segregated into three regions. The top region was conduction-dominated with the voids containing a stationary superheated steam. The middle region was convection-dominated, nearly isothermal, and exhibited an upward flow of the liquid by capillary forces and a downward flow of steam due to a slight pressure gradient. The bottom portion contained a stationary compressed liquid and was also conduction dominated. The length of the two-phase convection zone was evaluated through the application of Darcy's equations for two-phase flow and correlations of relative permeabilities and capillary pressure data. The model was in excellent agreement with the observed results, predicting a decreasing two-phase zone length with increasing heat flux. The thermodynamics of the two-phase zone were also analyzed. (17 refs.)

118597 Combined free and forced convection of water between horizontal concentric cylinders. T.Hung Nguyen, P.Vasseur, L.Robillard, B.Chandra Shekar (Dept. of Civil Engng., Univ. de Montreal, Montreal, Quebec, Canada).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.498-504 (Aug. 1983).
Presents a theoretical study of combined free and forced laminar convection of a mass of water confined between two horizontal concentric cylinders with constant surface temperatures and subject to an externally-imposed constant pressure gradient along the axial direction. The governing system of differential equations is solved, within the Boussinesq approximation, by perturbation and finite difference methods, and the solutions are obtained in terms of the various characteristic parameters of the problem. Essentially, it is found that the flow pattern and the wall shear stress in the axial direction are significantly affected by the Prandtl and the Rayleigh numbers. Thus, the axial flow shows a tendency to develop in two or even three jets, depending on the Rayleigh number. The occurrence of the inversion of density, for water at 4°C, was found to modify completely the convective, or secondary flow, but to have little effect on the main, or axial, flow. (24 refs.)

118598 Heat transfer of power law fluid at low Peclet number flow. Vi-Duong Dang (Dept. of Chem. Engng. & Materials Sci., Catholic Univ. of America, Washington, DC, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.542-9 (Aug. 1983).
An exact solution is presented for the temperature distribution and local Nusselt number of power law fluid in conduit at low Peclet number flow by considering axial conduction in both the upstream and the downstream regions while keeping the wall at constant temperature. Solutions are also reported for the parallel plate geometry for the aforementioned heat transfer condition and for constant wall heat flux boundary condition. The order of importance of axial conduction is established for different geometries and different boundary conditions. The effect of axial conduction is more significant when power law model index, s, increases for constant wall heat flux case, but the effect changes with Peclet number for constant wall temperature case. (25 refs.)

118599 Finite analytic numerical solution axisymmetric Navier-Stokes and energy equations. Ching-Jen Chen, Young Hwan Yoon (Div. of Energy Engng., Univ. of Iowa, Iowa City, IA, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.639-45 (Aug. 1983).
Convective heat transfer for steady-state laminar flow in axisymmetric coordinates is considered. Numerical solutions for flow pattern and temperature distribution are obtained by the finite analytic numerical method applied to the Navier-Stokes equations expressed in terms of vorticity and stream function, and the energy equation. The finite analytic numerical method differs from other numerical methods in that it utilizes a local analytic solution in an element of the problem to construct the total numerical solution. Finite analytic solutions of vorticity, stream function, temperature, and heat transfer coefficients for flow with Reynolds numbers of 5, 100, 1000, and 2000, and Prandtl numbers of 0.1, 1.0, and 10.0 with uniform grid sizes, are reported for an axisymmetric pipe with a sudden expansion and contraction. The wall temperature is considered to be isothermal and differs from the inlet temperature. It is shown that the finite analytic is stable, converges rapidly, and simulates the convection of fluid flow accurately, since the local analytic solution is capable of simulating automatically the influence of skewed convection through the element boundary on the interior nodal values, thereby minimizing the false numerical diffusion. (11 refs.)

118600 Natural convection experiments in a triangular enclosure. D.Poulikakos (Dept. of Mech. Engng., Univ. of Illinois, Chicago, IL, USA), A.Bejan.
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.652-5 (Aug. 1983).
Reports the results of a study of steady natural convection heat transfer in an attic-shaped (triangular) space. The experiment described was designed to shed light on the unknown phenomenon which might occur in a large-scale system, for example, in a life-size attic space or in ocean waters near shores with sloping bottoms. For this reason, the experimental study focused on: (i) a high Rayleigh number range not studied before, 10^6-10^9; (ii) the flow regime and, especially, those flow features which may prove essential in the future effort of modeling the phenomenon analytically. These objectives were achieved using a relatively large apparatus filled with air or water. The experiment simulated the 'night' mode of operation of an attic space, or the 'day' mode of a shallow-sloped coastal body of water heated from below by solar radiation. This simulation consisted of cooling the upper wall and heating the bottom wall of the experimental enclosure. (11 refs.)

118601 Variable fluid property effects on transport in pure water around the density extremum. R.D.Padlog (Turbocompressor Div., Joy Machinery Co., Buffalo, NY, USA), J.C.Mollendorf.
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.655-8 (Aug. 1983).
Numerous previous studies of buoyancy induced flows in cold water have been described by Gebhart and Mollendorf (1978). Ice melting experiments were done in pure water by Bendell and Gebhart (1976) followed by measurements in pure and saline water by Johnson and Mollendorf. At small temperature differences, the error between experiment and the constant property theory of Gebhart and Mollendorf (1978) is very small. However, as the temperature difference increases, the data are seen to be about 15 percent lower than constant property theory at about 20°C. In an attempt to explain the difference between constant property calculations and previous experiments, the authors' study extends the variable property calculations of Shaukatullah and Gebhart (1978) to include the region of convective inversion. Convective boundary layer flow is considered adjacent to an isothermal flat plate, which is in water at atmospheric pressure. Complications due to ice melting are considered, in as much as the effect of melted water produced is included in the boundary conditions as blowing and is shown to have an important effect on heat transfer. (6 refs.)

118602 A heat transfer correlation for natural convection from a vertical surface in cold water. V.P.Carey (Dept. of Mech. Engng., Univ. of California, Berkeley, CA, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.658-60 (Aug. 1983).
A new correlation is presented for natural convection heat transfer from a vertical isothermal surface in cold water. The correlation contains only one additional dimensionless parameter beyond the Nusselt, Grashof, and Prandtl numbers. This additional parameter quantifies the nonlinear density effect on transport. A major advantage of this correlation over Merk's (1953) is that its simple form makes it easier to observe and interpret trends in the heat transfer as conditions change. This simplicity is achieved without significant loss in accuracy. (12 refs.)

118603 Transient and steady-state natural convection in a porous medium between two concentric cylinders. G.N.Facas, B.Farouk (Dept. of Mech. Engng. & Mech., Drexel Univ., Philadelphia, PA, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.660-3 (Aug. 1983).
In the authors' work, transient, two-dimensional numerical calculations are presented for natural convective flow in a porous concentric annulus heated from inside. Several areas in which the natural convective transport of heat in such a geometry is important include buried pipelines, storage of solar energy in underground containers, and recovery of geothermal energy. Transient and steady-state solutions are obtained over a large range of Rayleigh number (10^0-10^3) using a finite difference method with central difference expressions. (8 refs.)

118604 Separated flow flutter of two dimensional triangular cylinder subjected to uniform flow from base. I. Preliminary experimental studies with flow visualizations by water tank and wake survey with small wind tunnel. T.Nagashima, K.Moriya, N.Iboshi, T.Shimomura (Dept. of Aeronautical Engng., Nat. Defense Acad., Yokosuka, Japan).
Sci. & Eng. Rep. Natl. Def. Acad. (Jpn.) (Japan), vol.20, no.4, p.415-34 (Dec. 1982). In Japanese. [received: Sept. 1983]
Discusses the dynamical angular motion of an isosceles triangular cylinder subjected to an uniform flow from its base surface in relation to wake structure. Results of flow visualization tests by the water tank and wake survey tests by the wind tunnel with two dimensional modes in fixed and rotation free conditions are presented. It is understood that the steady angular motion of the triangular cylinder subjected to uniform flow from the base is not the forced vibration due to Karman Vortex, but the typical self-excited oscillation caused by quasi-steady aerodynamical characteristics of its cross-section. It is also anticipated that the reattachment of the separated flow may play an important role to stabilize its self-excited oscillation. (7 refs.)

47.30 ROTATIONAL FLOW AND VORTICITY

118605 Spin-up from rest in a differentially rotating cylinder. J.M.Hyun (Clarkson Coll. of Technol., Potsdam, NY, USA).
AIAA J. (USA), vol.21, no.9, p.1278-82 (Sept. 1983).
Spin-up from rest in a cylinder with top and bottom end-wall disks rotating at different rates (Ω_T and Ω_B, respectively) is investigated by numerically integrating the unsteady Navier-Stokes equations. The approximate analytical model due to Wedemeyer and Venezian is briefly recounted. Numerical solutions for three sets of Ω_T/Ω_B for a cylinder of aspect ratio $O(1)$ and a minute Ekman number are presented. The results are detailed flowfield data that display the transient azimuthal velocity profiles, axial vorticity distributions, and the meridional flow patterns. An azimuthal velocity shear front, which separates the rotating from the nonrotating fluid, propagates radially inward. As Ω_T/Ω_B becomes close to unity, the propagation speed of the front increases and the spin-up in the interior is more effective. The axial vorticity is zero ahead of the front and is larger than twice the final-state angular speed of the fluid behind the front. The meridional circulation is no longer antisymmetric about the cylinder mid-depth as Ω_T/Ω_B deviates from unity. (14 refs.)

118606 Flows and pressure recovery in a rotating diffuser. Effects of inlet velocity distributions. K.Kikuyama, M.Murakami (Dept. of Mech. Engng., Nagoya Univ., Nagoya, Japan), S.Oda.
Bull. JSME (Japan), vol.26, no.216, p.970-7 (June 1983).
The flow patterns and pressure recoveries in a rotating two dimensional diffuser were studied for the case where uneven flows with a shear type velocity distribution were introduced into it. If the entering flow has higher velocities near the lower pressure side of the diffuser, the pressure recovery is improved by rotation of the diffuser and the recovery coefficient becomes higher than that observed in the stationary state of the diffuser. The improvement will be caused by a uniformalization of flow velocities in the rotating duct due to a vigorous secondary flow development. The reverse results prevail in the case where the flow enters the diffuser with higher velocities near the pressure side of the diffuser, the secondary flow being less vigorous in this case. (11 refs.)

118607 The structure of turbulence in homogeneous and stratified rotating fluids. E.J.Hopfinger, R.W.Griffiths, M.Mory (Inst. de Mecanique de Grenoble, Grenoble, France).
J. Mec. Theor. & Appl. (France), spec, suppl., p.21-44 (1983).
The authors briefly review laboratory experiments with turbulence in a rapidly rotating fluid and present new measurements of the flow that is created by an oscillating grid in a rotating container. These measurements show the quasi-two-dimensional nature of the turbulence. Freely evolving turbulence that ensues after forcing is stepped is also investigated. The length scale of the flow is found to increase due to the coalescence of vortices of like sign and doubles in a time which is an order of magnitude larger than the eddy turnover time. This flow is compared with that observed in recent experiments with a field of turbulence that is produced by baroclinic instability of a two-layer density stratification. (27 refs.)

118608 The mixing layer: an example of quasi two-dimensional turbulence. F.K.Browand, C.-H.Ho (Dept. of Aerospace Engng., Univ. of Southern California, Los Angeles, CA, USA).
J. Mec. Theor. & Appl. (France), spec, suppl., p.99-120 (1983).
During the last decade, it has been gradually recognized that a coherent large scale structure is the essential feature of many turbulent shear flows. In the turbulent mixing layer, this structure takes the form of quasi two-dimensional vortices aligned across the span of the flow. At least 50 per cent of the fluctuating (turbulent) kinetic energy can be directly associated with these vortices. Vortex interactions are responsible for the cross stream momentum transfer. Furthermore, the growth and entrainment properties of the mixing layer—determined by vortex interactions—can be effectively manipulated with very small, spatially coherent perturbations. (22 refs.)

118609 Rotating convective fluid flows with hall current effects. D.R.V.Prasada Rao, D.V.Krishna (Dept. of Maths., SK Univ., Anantapur, India).
Indian J. Pure & Appl. Math., vol.14, no.9, p.1105-16 (Sept. 1983).
An initial value investigation is made of the Hall effects on free and forced convective flow in a rotating channel. The unsteady problem is exactly solved by a method similar to that of Debnath et al. (1979). The steady state and the transient solutions are obtained with physical discussions. The structures of the associated boundary layers discussed are for small, intermediate and large frequency oscillations. The solution is obtained analytically and the behaviour of the velocity and shear stresses is discussed numerically for different values of the governing parameters. (15 refs.)

118610 Flow between rotating disks. I. Basic flow. A.Z.Szeri, S.J.Schneider, F.Labbe (Dept. of Mech. Engng., Univ. of Pittsburgh, Pittsburgh, PA, USA), H.N.Kaufman.
J. Fluid Mech. (GB), vol.134, p.103-31 (Sept. 1983).
Laser-Doppler velocity measurements were obtained in water between finite rotating disks, with and without throughflow, in four cases: $\omega_1\omega_2=0$; $\omega_2/\omega_1=-1$; $\omega_2/\omega_1=0$; $\omega_2/\omega_1=1$. The equilibrium flows are unique, and at mid-radius they show a high degree of independence from boundary conditions in r. With one disk rotating and the other stationary, this mid-radius 'limiting flow' is recognized as the Batchelor profile of infinite-disk theory. Other profiles, predicted by this theory to coexist with the Batchelor profile, were neither observed experimentally nor were they calculated numerically by

the finite-disk solutions, obtained via a Galerkin, *B*-spline formulation. Agreement on velocity between numerical results and experimental data is good at large values of the ratio R_Q/R_e, where $R_Q=Q/2\pi\nu s$ is the throughflow Reynolds number and $R_e=R_2^2\omega/\nu$ is the rotational Reynolds number. (26 refs.)

118611 Flow between rotating disks. II. Stability. A.Z.Szeri, A.Giron, S.J.Schneider (Dept. of Mech. Engng., Univ. of Pittsburgh, Pittsburgh, PA, USA), H.N.Kaufman.
J. Fluid Mech. (GB), vol.134, p.133-54 (Sept. 1983).
For pt.I see ibid., vol.134, p.103 (1983). Infinite-disk flows appear to possess multiple solutions at $E^{-1}=275$ (Holodniok, Kubicek and Hlavacek 1977), where $E=\nu/s^2\omega$ is the Ekman number. One of these solutions exhibits characteristics of Couette flow and is stable in the circular domain $0<r/s<50$. The other two solutions, both Poiseuille-type flows, are unstable at all positions. The stable solution shows strong resemblance to experimental profiles obtained between finite disks. Stability of finite-disk flows is investigated in two cases: (i) one disk rotating and the other stationary, and (ii) counter-rotating disks. Photographs indicate presence of two instability types. Theoretical calculations are in fair agreement with experimental evidence on instability of type I. (29 refs.)

118612 The standing vortex behind a disk normal to uniform flow at small Reynolds number. T.Miyagi, T.Kamei (Coll. of Engng., Univ. of Osaka Prefecture, Sakai, Japan).
J. Fluid Mech. (GB), vol.134, p.221-30 (Sept. 1983).
Viscous incompressible flow around a circular disk set normal to undisturbed flow is studied theoretically at small values of the Reynolds number. The critical Reynolds number at which a standing vortex first appears behind the disk is zero, and the flow separates from the edge of the disk. Several other features of the flow are obtained from the present analysis. (5 refs.)

118613 Gravity currents moving along a lateral boundary in a rotating fluid. R.W.Griffiths, E.J.Hopfinger (Inst. de Mecanique de Grenoble, Grenoble, France).
J. Fluid Mech. (GB), vol.134, p.357-99 (Sept. 1983).
Density currents in a rotating fluid are produced by releasing a volume of buoyant fluid from a lock at one end of a long rotating channel. Coriolis forces hold the current against one wall. It is observed that the velocity and depth of the nose decrease exponentially in time, implying that the nose can effectively come to a halt at a finite distance from the lock. In reality though, the flow regime eventually changes and a viscous wedge-shaped intrusion continues. The high-Reynolds-number currents contain three-dimensional turbulence a short distance behind the nose, but the influence of rotation causes this to become quasi-two-dimensional further upstream. The intrusion and turbulent motions represent a forcing to the lower layer that produces vortex and wave-like motions which penetrate deep into the lower-layer fluid. It is shown that the exponential decay can be attributed to radiation of momentum by these inertial waves. (22 refs.)

118614 Initial stages in the development of thermals. B.I.Zaslavskii.
J. Appl. Mech. & Tech. Phys. (USA), vol.23, no.6, p.792-5 (Nov.-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR)*, vol.23, no.6, p.65-9 (Nov.-Dec. 1982). [received: Sept. 1983]
A free spherical volume of fluid that is lighter than the surrounding medium is transformed into a vortex ring, i.e. the core of a buoyant vortex ring. In the present paper the transformation process is discussed, experimental results are given, and equations are developed to determine the fundamental parameters that arise as a result of such a process of the buoyant vortex-thermal ring. (10 refs.)

118615 Heat transfer to a fluid in radial, outward flow between two coaxial stationary or corotating disks. N.V.Suryanarayana, T.Scofield, R.E.Kleiss (Dept. of Mech. Engng. & Engng. Mech., Michigan Technol. Univ., Houghton, MI, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.519-26 (Aug. 1983).
An experimental study of heat transfer rates to air flowing radially outward between two coaxial, corotating disks was made. Heat transfer data were obtained for five mass flow rates with stationary disks and four mass flow rates and five rotational speeds with rotating disks. Rotation of the disks slightly decreased the average Nusselt numbers compared with the average Nusselt numbers without rotation at the highest speed of rotation (600 r.m.p.), but at lower speeds no consistent trends were observed. The average Nusselt numbers, with and without rotation, can be related as $\mathrm{Nu}=0.0529\ \mathrm{Re}^{0.71}$ and the local Nusselt number as $\mathrm{Nu}=0.124\ \mathrm{Re}^{0.608}$. (6 refs.)

118616 Boundary layers on characteristic surfaces for time-dependent rotating flows. R.F.Gans (Dept. of Mech. Engng., Univ. of Rochester, Rochester, NY, USA).
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.2, p.251-4 (June 1983).
Time-dependent motion of a fluid in a container rotating at Ω is characterized by boundary layers on the container surfaces if ν/Ω, where ν denotes kinematic viscosity, is small compared to the square of a typical length of the container. Let the frequency of the motion, measured in a corotating coordinate system, be $\omega\Omega$. If $\omega\sim1$, then the length scale of the boundary layer is $(\nu/\Omega)^{1/2}$, unless $|\omega|$ is equal to twice the normal component of the unit rotation vector. If $|\omega|$ does equal twice the normal component of the unit rotation vector, scales of $(\nu/\Omega L^2)^{1/3}L$ and $(\nu/\Omega L^2)^{1/4}L$ are possible. If the normal vector and rotation vectors are parallel, the former scale vanishes. (6 refs.)

118617 Superpotential solution for jet-engine external potential and internal rotational flow interaction. W.C.Chin.
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.2, p.259-64 (June 1983).
For flows with prescribed parallel shear far upstream, the vorticity generation term in the disturbance stream-function (ψ) equation and the Bernoulli 'constant,' both of which vary from stream surface to stream surface, are explicitly evaluated as power series in ψ with curvature-dependent coefficients, for axisymmetric flows using some invariant properties of vorticity. By casting the linearized stream-function equation in conservation form, extended Cauchy-Reimann conditions are obtained, implying a 'superpotential' ϕ^* satisfying a 'Laplace-like' equation useful for solving flows past prescribed shapes; the corresponding tangency and Kutta conditions, interestingly, take a 'potential form,' so that simple changes to existing potential flow algorithms extend their applicability to strong oncoming shears with arbitrary curvature. The theory, which applies to duct flows behind actuator disks generating shear, is sketched for both 'analysis' and 'design' formulations; the authors address the interaction between external potential and internal rotational jet-engine flows occurring through both an assumed actuator disk and a trailing edge slipstream, and provide representative numerical calculations. (4 refs.)

118618 Turbulent exchange in the vortex model. I.Z.Gabdullin, A.A.Solov'ev, A.D.Solodukhin.
Vestsi Akad. Navuk BSSR Ser. Fiz. Energ. Navuk, no.3, p.54-6 (1983). In Russian.
Experimental results on turbulent stresses and averaged velocities in eddy vertical air flows are reported. (7 refs.)

47.35 WAVES

118619 The stability of steep gravity waves. M.Tanaka (Dept. of Phys., Kyoto Univ., Kyoto, Japan).
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3047-55 (Sept. 1983).
The linear stability of steep gravity waves is investigated for superharmonic disturbances. For this problem, Longuet-Higgins presented a conjecture that the gravity wave would become unstable to superharmonic disturbances at the steepness where the phase speed of the wave attains a maximum. Contrary to this conjecture, it is found that the instability first occurs at the steepness which corresponds to the maximum not of the phase speed but of the total energy and the impulse of the wave. This discrepancy implies the possibility of the superharmonic bifurcation of steady gravity waves in the region of large steepness. (9 refs.)

118620 Solitary and periodic gravity-capillary waves of finite amplitude. J.K.Hunter (Dept. of Maths., Colorado State Univ., Fort Collins, CO, USA), J.-M.Vanden-Broeck.
J. Fluid Mech. (GB), vol.134, p.205-19 (Sept. 1983).
Two-dimensional solitary and periodic waves in water of finite depth are considered. The waves propagate under the combined influence of gravity and surface tension. The flow, the surface profile and the phase velocity are functions of the amplitude of the wave and the parameters $l=\lambda/H$ and $\tau=T/\rho gH^2$. Here λ is the wavelength, H the depth, T the surface tension, ρ the density and g the acceleration due to gravity. For $\tau>{}^1/_3$, large values of l and small values of the amplitude, the profile of the wave satisfies the Korteweg-de Vries equation approximately. However, for τ close to ${}^1/_3$ this equation becomes invalid. In the authors' paper a new equation valid for τ close to ${}^1/_3$ is obtained. Moreover, a numerical scheme based on an integro-differential-equation formulation is derived to solve the problem in the fully nonlinear case. Accurate solutions for periodic and solitary waves are presented. (31 refs.)

118621 The occurrence of separation in oscillatory flow. I.J.Sobey (School of Maths., Univ. of Bristol, Bristol, England).
J. Fluid Mech. (GB), vol.134, p.247-57 (Sept. 1983).
The author uses the results of numerical solutions of the unsteady Navier-Stokes equations to study the occurrence of separation in unsteady flow. The structure of a flow cycle depends strongly on the Strouhal number, whose value can be classified as small, intermediate or large. In each of these regions different effects are calculated, and the author gives guidelines for the boundaries of these regions. In particular, he shows that the small-Strouhal-number region, in which quasi-steady flow is observed, is very small and decreases rapidly as the peak Reynolds number increases. (6 refs.)

118622 Free-surface flows related to breaking waves. M.Greenhow (Dept. of Appl. Maths. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).
J. Fluid Mech. (GB), vol.134, p.259-75 (Sept. 1983).
Using the semiLagrangian approach of John (1953), both Longuet-Higgins (1982) and New (1983) have proposed simple analytical models of the underside or loop of a plunging breaking wave. Although New's ellipse model appears to be remarkably accurate both in profile and free-surface particle dynamics for a limited region of the loop, both of the loop models are shown to be deficient because neither correctly accounts for the rest of the wave. On the other hand, Longuet-Higgins (1983) gives a semiLagrangian representation of the Dirichlet hyperbola, previously shown to be relevant to the jet of fluid ejected from the top of a breaking wave (see Longuet-Higgins 1980). The author shows that both this jet flow and the ellipse model of New describing the loop are, for large time, complementary solutions of the same free surface equation. This in turn suggests solutions which combine both the jet and the loop, to give a much more complete model of the entire overturning region not too far from the wave crest, and which has approximately correct free-surface particle velocities and accelerations. (9 refs.)

118623 On surface gravity waves crossing weak current jets. J.Smith (Dept. of Oceanography, Naval Postgraduate School, Monterey, CA, USA).
J. Fluid Mech. (GB), vol.134, p.277-99 (Sept. 1983).
Variations in wave amplitude and steepness across current jets have been described for broad smooth-sided jets. Narrow jets are modelled by a top-hat pattern; an approximate solution is found for linear waves, based on conservation of wave action and vertical averaging. The results join remarkably well to those for a broad cosine-shaped jet (cf. McKee 1975). For jet widths less than about a third of a wavelength, there is little change in amplitude; the enhancement predicted by a WKB analysis is suppressed owing to interference with reflections from the far side of the jet. For directional spectra not too different from $\cos^2\theta$, some suppression occurs near the middle of jets of all scales, owing to exclusion of the glancing wave components by reflection from

the near side; this suppression can be significant for jets more than a wavelength wide. For monochromatic waves, maximum amplitudes occur some distance outside the jet owing to interference; the net reflection appears to have a positive phase shift along the near caustic of about $^1/_4$ cycle. (20 refs.)

118624 Theory of interaction of gravity waves with hydrodynamic turbulence. A.G.Sazontov.
J. Appl. Mech. & Tech. Phys. (USA), vol.23, no.6, p.783-91 (Nov.-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR)*, vol.23, no.6, p.55-65 (Nov.-Dec. 1982). [received: Sept. 1983]
The study of the vortex-wave turbulence with reference to the interaction of gravity waves with vortices is presented. The present problem has a number of special features associated with the fact that surface waves in deep water are dispersive, the phase velocity vϕ is a function of wavelength $\lambda : \nu_{\Phi} = \sqrt{g\lambda}$ (g is the acceleration of gravity, $\lambda = \lambda/2\pi$). The logarithmic decrement for gravity waves propagating at the surface of a turbulent liquid has been found on the basis of computed matrix of interaction coefficients. An estimate of the characteristic phase correlation time and the time for making the wave field isotropic in elastic scattering have been obtained. The diffusion approximation has been used to analyze the effect of inelastic scattering on the development of isotropic wave packets as a function of frequency. The limits of the applicability of kinetic equations to describe the mutual interaction of gravity waves in a turbulent medium have been explained. (20 refs.)

118625 Nonlocal progressive capillary waves of arbitrary amplitude. S.J.Hogan (Univ. of Cambridge, Cambridge, England).
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.3, p.271-5 (May-June 1983). [received: Sept. 1983]
A recent paper by Chiroiu (1979) is shown to be incorrect for the case of nonlocal progressive capillary wave propagation on fluid on finite depth. A sketch of the correct solution is given. (9 refs.)

118626 Two hidden symmetries of the equations of ideal gasdynamics, and the general solution in a case of non-uniform entropy distribution. B.Gaffet (Section d'Astrophys., CENS, Gif-sur-Yvette, France).
J. Fluid Mech. (GB), vol.134, p.179-94 (Sept. 1983).
Through an extension of the concept of scale invariance the author constructs two invariance transformations of the equations of gasdynamics. The first is a true Backlund transformation, and as such one expects that it should play an important role in the search for new cases of integrability. The second one affects the shape of the entropy profile, implying that the mathematical problems of isentropic and non-isentropic flow are, at least in some cases, equivalent. This enables one to deduce the general solution in closed form, assuming a power-law entropy profile of the form $P/\rho^{\gamma} \approx 1/M^{3\gamma-1}$, where M is the Lagrangian mass coordinate. (9 refs.)

118627 k-ϵ equation for compressible reciprocating engine flow. S.H.El Tahry (General Motors Res. Lab., Warren, MI, USA).
J. Energy (USA), vol.7, no.4, p.345-53 (July-Aug. 1983).
The k-ϵ model currently is being used by several investigators as a submodel for the calculations of turbulent flows in engines using multidimensional procedures. As this submodel mainly was developed and tested for incompressible flows, attempts were made and described in the literature to modify the model to suit engine applications. In these attempts, little effort was made to examine the basic κ and ϵ equations closely. Because these equations contain information that could be quite helpful in developing the model, in the present study the basic k and ϵ equations are examined with an analysis tailored to identify important terms that appear during compression/expansion in engine cylinders. It transpires from the analysis that some terms that were neglected basically in earlier studies could be quite large. Modeling some of these terms in the ϵ equation was relatively straightforwared and did not add any unknown constants. Thus, these terms were added to the ϵ equation in the new model. The remaining terms, which are significant only during combustion, are more complex, and it is doubtful that they could be modeled without the addition of model constants. Because of a lack of data necessary to estimate the model constants, these terms were neglected. A comparison between the new and an earlier version of the model revealed that the new version yielded more physically plausible results. (21 refs.)

118628 Nonlinear stability conditions and a priori estimates for barotropic hydrodynamics. D.D.Holm, J.E.Marsden, T.Ratiu, A.Weinstein (Center for Nonlinear Studies, Los Alamos Nat. Lab., Los Alamos, NM, USA).
Phys. Lett. A (Netherlands), vol.98A, no.1-2, p.15-21 (3 Oct. 1983).
A method developed by Arnold (1969) to prove nonlinear stability of certain steady states for ideal incompressible flow in two dimensions is extended to the barotropic compressible case. The results are applied to plane shear flow. (21 refs.)

47.40H Transonic flows

118629 Characteristic frequencies of transonic diffuser flow oscillations. T.J.Bogar, M.Sajben, J.C.Kroutil (McDonnell Douglas Corp., St. Louis, MO, USA).
AIAA J. (USA), vol.21, no.9, p.1232-40 (Sept. 1983).
The time-mean and unsteady flow characteristics of a supercritical transonic diffuser are investigated as a function of shock Mach number and diffuser length. The flow is either attached or undergoes shock-induced separation, depending on shock strength. The power spectral density distributions of the unsteady shock motion display up to three distinct peaks, depending on flow conditions. For attached flow, the characteristic frequencies scale with the distance from the shock to the diffuser exhaust. Their origin is acoustic and frequencies up to the third harmonic are observed. For shock-induced separation, the single characteristic frequency observed does not follow acoustic predictions. The mechanism of these oscillations may be related to the core flow dimensions or to the spectral amplitude response characteristics of the terminal shock. (20 refs.)

118630 A grid overlapping scheme for flowfield computations about multicomponent configurations. E.H.Atta, J.Vadyak (Lockheed-Georgia Co., Marietta, GA, USA).
AIAA J. (USA), vol.21, no.9, p.1271-7 (Sept. 1983).
An efficient grid interfacing zonal algorithm has been developed for computing the transonic flowfield about three-dimensional multicomponent configurations. The algorithm uses the full-potential formulation and the AF2 fuly implicit approximate factorization scheme. The flowfield solution is computed using a component-adaptive grid approach in which separate grids are employed for the individual components in the multicomponent configuration, where each components grid is optimized for a particular geometry. The component grids are allowed to overlap, and flowfield information is transmitted from one grid to another through the overlap region. An overlapping grid scheme has been implemented for an isolated wing and a noninteracting wing/pylon/nacelle configuration. Numerical results show that the present algorithm is stable, accurate, and promises to be effective in computing the flowfield about complex configurations. (9 refs.)

118631 A least squares finite element scheme for transonic flow around harmonically oscillating airfoils. C.L.Cox, G.J.Fix, M.D.Gunzburger (Dept. of Maths., Carnegie-Mellon Univ., Pittsburgh, PA, USA).
J. Comput. Phys. (USA), vol.51, no.3, p.387-403 (Sept. 1983).
A finite element scheme based on a least squares variational principle is used to calculate the transonic flow field around harmonically oscillating airfoils. The most important features of this procedure are its sensitivity to equation type and the absence of frequency limitation. Sample numerical results are reported including transonic flows containing shocks. (13 refs.)

118632 An extension of the pressure unitary formula, valid both for compression and expansion, over the whole transonic regime ($M_{\infty}>1$). E.Carafoli, S.Tomescu (INCREST, Bucharest, Rumania).
Rev. Roum. Sci. Tech. Ser. Mec. Appl. (Rumania), vol.28, no.3, p.245-54 (May-June 1983). [received: Sept. 1983]
The application of a unitary formula valid for compression-expansion in supersonic regime has been extended to Mach numbers in the neighbourhood of $M_{\infty}=1$. To this purpose one computes the values of the pressure coefficients for various δ deviations of the M_{∞} incident flow; the results found are very close to the accurate ones. There are several exemplifications meant for the obtainment of other parameters of the motion, both in the compression case and the expansion case, as a function of the pressure coefficient, C_p. The method also allows,in the compression case, to determine the flow parameters in the neighbourhood of the shock wave detachment over the whole supersonic speed domain. Since remarkable results are obtained in determining the parameters of the supersonic flows in the neighbourhood of $M_{\infty}=1$, the method can be used for determining the pressures on profiles in transonic regime. (2 refs.)

118633 Some remarks on transonic potential flow theory. D.Nixon, G.H.Klopfer (Nielsen Engng. & Res. Inc., Mountain View, CA, USA).
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.2, p.270-4 (June 1983).
The validity of the commonly used transonic potential equation for flows with shock waves is examined. It is concluded that in such cases the potential formulation is inconsistent with the basic assumptions of the theory because of the nonconservation of momentum across a shock. The relationship of this momentum source to wave drag is also discussed. Another topic examined is the rationalization of means to make solutions of the transonic potential equation agree better with solutions of the Euler equations. (10 refs.)

47.40K Supersonic and hypersonic flows

118634 An efficient, full-potential implicit method based on characteristics for supersonic flows. V.Shankar (Rockwell Internat. Sci. Center, Thousand Oaks, CA, USA), S.Osher.
AIAA J. (USA), vol.21, no.9, p.1262-70 (Sept. 1983).
A nonlinear aerodynamic prediction technique based on the full-potential equation in conservation form has been developed for the treatment of supersonic flows. The method uses the theory of characteristic signal propagation to accurately simulate the flow structure, which includes shock waves and mixed elliptic-hyperbolic crossflow. An implicit approximate factorization scheme is employed to solve the finite-differential equation. The necessary body-fitted grid system in every marching plane is generated numerically, using an elliptic grid solver. Results are shown for conical and nonconical wing-body combinations and compared with experimental data and Euler calculations. The method demonstrates an enormous saving in execution time and memory requirements over Euler methods. (15 refs.)

118635 Supersonic turbulent boundary layers subjected to a pressure gradient: calculation with a k-ϵ model. J.M.Galmes (Inst. de Mecanique Statistique de la Turbulence, Marseille, France), J.P.Dussauge, I.Dekeyser.
J. Mec. Theor. & Appl. (France), vol.2, no.4, p.539-58 (1983). In French.
The computation of supersonic turbulent boundary layers subjected to positive or negative pressure gradients is presented. A two equation model of turbulence (k-ϵ) is used; the turbulent shear stress is obtained from the Boussinesq hypothesis. The role of compressibility is discussed and the authors modify the model to take such effects into account. For accelerated or decelerated supersonic flows, source terms involving mean dilatation and mean pressure gradient terms are introduced in the equations of k and ϵ. Computation results are compared with measurements obtained in various experiments. (7 refs.)

118636 Numerical determination of the parameters of high entropy layers in bodies with a small degree of bluntness in supersonic flow. V.I.Timoshenko.
Zh. Vychisl. Mat. & Mat. Fiz. (USSR), vol.23, no.4, p.947-53 (July-Aug. 1983). In Russian. English translation in: *USSR Comput. Math. & Math. Phys. (GB)*
Singularities are analysed in the application of finite difference methods for the calculation of supersonic flow of bodies with a low degree of bluntness associated with the determination of parameters of a gas in a thin entropy layer at the surface of the body. An algorithm is proposed, and the results of calculating the parameters in a high entropy layer are presented. The results can be used in the solution of a problem of vortex interaction. (9 refs.)

118637 Performance study of shock tubes with area change at the diaphragm section. Effects on the shock tube performance of diaphragm location, area ratio and convergent angle. H.Sugiyama (Muroran Inst. of Technol., Muroran, Japan).
Bull. JSME (Japan), vol.26, no.216, p.958-63 (June 1983).
Shock tubes with area change at diaphragm section have been widely used in many engineering fields, but the performance of such shock tubes is not sufficiently well known, especially about the effects on the performance of the diaphragm location and a the shape of convergent section. The effects on the performance of the diaphragm location, area ratio and convergent angle have been experimentally studied, and the results given. (12 refs.)

118638 Simulation of detonation cell kinematics using two-dimensional reactive blast waves. G.O.Thomas, D.H.Edwards (Dept. of Phys., Univ. Coll. of Wales, Aberystwyth, Wales).
J. Phys. D (GB), vol.16, no.10, p.1881-92 (14 Oct. 1983).
An improved method of generating a cylindrical blast wave is described which overcomes the disadvantages inherent in the converging-diverging nozzle technique previously used by the authors (1981). A diverging detonation vessel was constructed from two sheets of glass and two Tufnol blocks which form a variable-angle sector. An exploding wire, placed at the apex of the sector, was used to generate blast waves of variable strength. The trajectory of the shock wave and the density field behind the front was recorded by a streak-Schlieren interferometer. It is shown that the observed velocity profile simulates the behaviour of that found in freely propagating detonations satisfactorily. Moreover it is confirmed that the post-shock density decay parameter has a constant value of 4 which is in accord with previous studies; it is suggested that this is a universal value in detonation cells. (14 refs.)

118639 Perturbation procedures for nonlinear viscous flows. D.Nixon (Nielsen Engng. & Res. Inc., Mountain View, CA, USA).
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.2, p.265-9 (June 1983).
The perturbation theory for transonic flow is further developed for solutions of the Navier-Stokes equations in two dimensions or for experimental results. The strained coordinate technique is used to treat changes in location of any shock waves or large gradients. (7 refs.)

47.45 RAREFIED GAS DYNAMICS

(see also 07.30 Vacuum production and techniques)

118640 Rarefied gas flow in a cylindrical annulus. S.S.Lo, S.K.Loyalka, T.S.Storvick (Coll. of Engng., Univ. of Missouri, Columbia, MO, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1539-48 (1983).
The Hansen-Morse model (1967) of the linearized Wang Chang-Uhlenbeck equation is used to study the thermal transpiration and mechanocaloric effects for rarefied polyatomic gases in a cylindrical annulus, where boundary conditions are characterized by diffuse reflection. Phenomenological coefficients at all degrees of rarefaction are reported for physical parameters that represent helium, hydrogen, carbon dioxide, and air. Comparisons with isothermal flow data are given. (33 refs.)

118641 Thermal polarization of bodies in the rarefied gas flow. S.P.Bakanov, V.V.Vysotskij, B.V.Derjaguin, V.I.Roldughin (Dept. of Surface Phenomena, Inst. of Phys. Chem., Acad. of Sci., Moscow, USSR).
J. Non-Equilibrium Thermodyn. (Germany), vol.8, no.1, p.75-83 (1983).
A new phenomenon, the thermal polarization of bodies in a rarefied gas flow, has been predicted theoretically and detected experimentally. In accordance with Onsager's principle of symmetry, the phenomenon is connected with thermophoresis in gas. The measurement of the thermal polarization effect provides a possibility for determining the values of the momentum and energy accommodation coefficients of gas molecules on the surface of solid and liquid bodies. The experimental detection of the thermal polarization of bodies is a substantial contribution to the theoretical substantiation of the applicability of irreversible thermodynamics methods to the description of some phenomena in the region where the hydrodynamic approximation is not valid. (14 refs.)

118642 Compatibility criteria for generalized Boltzmann equations. C.C.A.Sastri (Dept. of Maths., Statistics & Computing Sci., Dalhousie Univ., Halifax, NS, Canada).
Nuovo Cimento B (Italy), vol.77B, ser.2, no.1, p.42-8 (11 Sept. 1983).
It is suggested that long-range correlations in a rarefied gas can be described by a hierarchy of generalized Boltzmann equations which, unlike either the Liouville equation or the BBGKY hierarchy, take the rarefaction of the gas into account and are presumably easier to handle. The equations are postulated, and compatibility criteria for their truncation as well as a class of truncations are proposed. The work presented here can be regarded as a further step toward a kinetic theory of turbulence (for rarefied gases) along the lines of Zhigulev (1966) and Tsuge (1970). (15 refs.)

47.50 NON-NEWTONIAN DYNAMICS

118643 Slow flow of a non-Newtonian fluid past a micro-capsule. P.O.Brunn, J.Gilbert, D.Jiji (Dept. of Chem. Engng. & Appl. Chem., Columbia Univ., New York, NY, USA).
Appl. Sci. Res. (Netherlands), vol.40, no.3, p.253-70 (1983).
The streaming motion past a spherical microcapsule is studied. The particle consists of a thin elastic membrane enclosing an incompressible fluid. Since the problem is highly nonlinear, a perturbation solution is sought in the limiting case where the deviation from sphericity is small. Obviously, the capsule remains nearly spherical when λ, the ratio of viscous forces to elastic (shape-restoring) membrane forces is small. In this limit, the rheology of the inside fluid is immaterial and the problem is essentially characterized by three parameters: λ, the Reynolds number Re (interia effect), and the Weissenberg number We (nonNewtonian effect). The deformation is obtained explicitly under the restriction $We<1$, $Re<1$. It is shown that to leading order, the capsule deforms exactly into a spheroid which can be either oblate or prolate, depending mainly upon the elasticity number We/Re: for $We/Re<0.57$ the spheroid is oblate, while for $We/Re>0.81$ a prolate spheroid results. For $0.57<We/Re<0.81$ additional details of the rheology of the membrane and of the suspending fluid are needed. (14 refs.)

118644 Effect of pipe diameter on polymer drag reduction. R.H.J.Sellin, M.Ollis (Dept. of Civil Engng., Univ. of Bristol, Bristol, England).
Ind. & Eng. Chem., Prod. Res. & Dev. (USA), vol.22, no.3, p.445-52 (Sept. 1983).
Tests were conducted in six different pipe diameters (from 1 to 50 mm) with the same polymer. This was a polyacrylamide of only moderate drag reducing ability to ensure that the onset point could be determined directly wherever possible and that the results in the polymeric zone were unaffected by the maximum drag reduction region. Standardized solution preparation was adopted throughout and Granville's method of scale-up proved, with some limitations, to give the best and most convenient method of performance prediction. Attempts to explain drag reduction differences between large and small pipes were only partially successful. (12 refs.)

118645 Heat transfer in the flow of a second-order fluid under an enclosed rotating disc. H.G.Sharma, K.R.Singh (Dept. of Math., Univ. of Roorkee, Roorkee, India).
Indian J. Technol., vol.21, no.3, p.101-4 (March 1983). [received: Oct. 1983]
The problem of heat transfer in the steady flow of an incompressible second-order fluid under an enclosed rotating disc has been discussed. The effects of elastico-viscosity and cross-viscosity of the fluid on the temperature profile and Nusselt numbers on the rotor and stator for radial outflow and inflow have been investigated in the regions of no-recirculation and recirculation. (11 refs.)

118646 Flow of a non-Newtonian second-order fluid between two infinite torsionally oscillating discs. H.G.Sharma, D.S.Gupta (Dept. of Maths., Univ. of Roorkee, Roorkee, India).
Indian J. Pure & Appl. Math., vol.14, no.9, p.1091-9 (Sept. 1983).
The flow of an incompressible second-order fluid due to torsional oscillations of two infinite discs has been considered by expanding the velocity components and the pressure in powers of the amplitude of oscillation. The transverse and radial flows are investigated in detail. It is found that the effects of second-order forces increase the amplitude of the oscillation of the axial velocity. The steady part of velocity components for small values of Reynolds number have been studied and shown graphically. The transverse shearing stress and moment on the discs have also been obtained. (8 refs.)

118647 Perturbation theory for viscoelastic fluids between eccentric rotating cylinders. A.Beris, R.C.Armstrong, R.A.Brown (Dept. of Chem. Engng., MIT, Cambridge, MA, USA).
J. Non-Newtonian Fluid Mech. (Netherlands), vol.13, no.2, p.109-48 (Sept. 1983).
The circumferential and radial profiles of velocity, pressure and stress are derived for the flow of model viscoelastic liquids between two slightly eccentric cylinders with the inner one rotating. Singular perturbation methods are used to derive expansions valid for small gaps between the cylinders, but for all Deborah numbers. Results for Newtonian, second-order, Criminale-Ericksen-Filbey, upper-convected Maxwell, and White-Metzner constitutive equations separate the effects of elasticity, memory, and shear thinning on the development of the large stress gradients that hinder numerical solutions with these models in more complicated geometries. The effect of the constitutive equation on the critical Deborah number for flow separation is presented. (32 refs.)

118648 Squeezing flow of elastic liquids. M.A.McClelland, B.A.Finlayson (Dept. of Chem. Engng., Univ. of Washington, Seattle, WA, USA).
J. Non-Newtonian Fluid Mech. (Netherlands), vol.13, no.2, p.181-201 (Sept. 1983).
A theoretical analysis is made of the relation between applied force and plate separation for squeezing flows of viscoelastic liquids between closely-spaced parallel disks. The lubrication approximation and the quasisteady-state assumption are employed in the development. Elastic effects are incorporated through inclusion of normal stresses. Solutions are presented for liquids with power-law viscometric functions, and a numerical procedure is used for fluids having viscometric functions of arbitrary form. For fast and slow squeezing, calculated values of $t_{1/2}$, the time required to squeeze out half the fluid, agree with the constant force data of Leider (1973, 1974). (21 refs.)

47.55 NONHOMOGENEOUS FLOWS

118649 Shape and stability of a liquid drop moving at low Weber numbers. I.Frankel, D.Weihs (Dept. of Aeronautical Engng., Technion-Israel Inst. of Technol., Haifa, Israel).
Appl. Sci. Res. (Netherlands), vol.40, no.3, p.279-94 (1983).
The equilibrium cross sectional shape and stability of a liquid drop moving in a gaseous medium is studied analytical. Such liquid drops appear as the final product in numerous industrial spraying and atomisation processes. Raindrops falling at their terminal speed can also be described by the present model. The equilibrium shape is formed by the interaction of two factors: the dynamic pressure distribution in the gaseous medium which tends to deform the liquid drop into an oblate shape and the surface tension which tends to restore the spherical shape. The meridional shape of the liquid drop is obtained as a power series in the Weber number. The linear stability of the deformed shapes described above to small surface disturbances is studied. The stability analysis shows the effect of the surrounding gas flow on the natural frequencies of oscillation (vibration) of the liquid drop. (19 refs.)

118650 The creeping motion of immiscible drops through a converging/diverging tube. W.L.Olbricht, L.G.Leal (Dept. of Chem. Engng., California Inst. of Technol., Pasadena, CA, USA).
J. Fluid Mech. (GB), vol.134, p.329-55 (Sept. 1983).
Results of experiments on the low-Reynolds-number flow of liquid drops through a horizontal circular tube with a diameter that varies sinusoidally with axial position are reported. Measurements of the contribution of the drop to the local pressure gradient and the relative velocity of the drop are correlated with the time-dependent drop shape. Both Newtonian and viscoelastic suspending fluids are considered. The viscosity ratio, volumetric flow rate and drop size are varied in the experiment, and both neutrally buoyant and non-neutrally buoyant drops are studied. Comparison with previous results for a straight-wall tube shows that the influence of the tube boundary geometry on the drop shape is substantial, but the qualitative effect of the tube shape depends strongly on the relative importance of viscous forces compared to interfacial tension for the particular experiment. For Newtonian fluids, two modes of drop breakup, which are distinguished by the magnitude of the viscosity ratio, are observed. When the suspending fluid is viscoelastic, both shear-thinning and time-dependent rheological effects are present. (32 refs.)

47.55C Jets

118651 Spurt of gas from a hole into air. A.Sakurai (Coll. of Sci. & Engng., Tokyo Denki Univ., Saitama, Japan), F.Takayama.
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.2963-5 (Sept. 1983).
Results of experimental and numerical investigations on the behaviour of spurting gas from a hole into air are analysed to show that a salient feature of the flow characteristics of the air can be described by the point source blast wave theory. (6 refs.)

118652 The 'whistler-nozzle' phenomenon. A.K.M.F.Hussain, M.A.Z.Hasan (Dept. of Mech. Engng., Univ. of Houston, Houston, TX, USA).
J. Fluid Mech. (GB), vol.134, p.431-58 (Sept. 1983).
The 'whistler nozzle' is a simple device which can induce jet self-excitations of controllable amplitudes and frequencies and appears highly promising for many applications involving turbulent transport, combustion and aerodynamic noise. This paper documents the characteristics of this curious phenomenon for different values of the controlling parameters and explains the phenomenon. It is shown that the whistler excitation results from the coupling of two independent resonance mechanisms: shear-layer tone resulting from the impingement of the pipe-exit shear layer on the collar lip, and organ-pipe resonance of the pipe nozzle. The crucial role of the shear-layer tone in driving the organ-pipe resonance is proven by reproducing the event in pipe-ring and pipe-hole configurations in the absence of the collar. It is also shown that this phenomenon is strongest when the self-excitation frequency matches the 'preferred mode' of the jet. The 'whistler-nozzle' phenomenon occurs for both laminar and turbulent initial boundary layers; the excitation can be induced without the pipe nozzle (say, by ring or hole tone) when the exit flow is laminar but not when it is turbulent. (33 refs.)

118653 Plane jet interaction with three-dimensional disturbances. N.M.Terekhova.
J. Appl. Mech. & Tech. Phys. (USA), vol.23, no.6, p.796-803 (Nov.-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR)*, vol.23, no.6, p.69-76 (Nov.-Dec. 1982). [received: Sept. 1983]
The interaction of oblique disturbances in the form of intersecting oblique Tollmien-Schlichting waves of finite amplitude with the plane flow without solid boundaires, viz. laminar jet with Bickley-Schlichting velocity profile has been considered. On the basis of an accurate solution of Reynolds equations, longitudinal vortices and secondary mean flow have been found and it has been shown that the momentum redistribution in such an interaction from the jet axis to the outer region agrees with the experimental results. The secondary flow happens to be more stable than the basic flow. The interaction of plane waves and the flow is the critical factor for excitation in the transition region. (13 refs.)

118654 Investigation of jet flow past slotted and wedge-shaped nozzles in a shock tube [of relevance to gasdynamic lasers]. V.V.Golub, V.V.Grigor'ev, Yu.I.Grin', S.N.Isakov, I.M.Naboko, R.L.Petrov, V.G.Testov.
J. Appl. Mech. & Tech. Phys. (USA), vol.23, no.6, p.803-7 (Nov.-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR)*, vol.23, no.6, p.76-80 (Nov.-Dec. 1982). [received: Sept. 1983]
Results are given for experimental studies on three-dimensional and plane jets in shock tubes under conditions similar to those in which studies on the laser characteristics of gas flows were conducted: transient time for the density field and the flow geometry, spatial characteristics of density distribution. (8 refs.)

118655 Measurements of turbulent Prandtl number in a plane jet. L.W.B.Browne, R.A.Antonia (Dept. of Mech. Engng., Univ. of Newcastle, Newcastle, NSW, Australia).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.663-5 (Aug. 1983).
Jenkins and Goldschmidt (1973) presented data, obtained from several sources, of spreading parameters for turbulent plane and circular jets into still air. Although relatively wide variations were evident in individual spread rates for temperature and velocity fields, the ratio of these spread rates was constant, the constant being slightly larger for the plane jet (1.42) than the circular jet (1.22). There are few measurements of momentum and heat fluxes in both plane and circular jets. In a plane jet, Jenkins and Goldschmidt (1974) found that conditional averages, in the turbulent part only of the flow, of turbulent momentum and thermal diffusivities were approximately constant. The ratio of these diffusivities or turbulent Prandtl number Pr_t was also approximately constant (equal to 0.4) in the intermittent region of the jet and showed a tendency to increase towards the centerline. Van der Hegge Zijnen (1957) had calculated Pr_t using measured mean velocity and mean temperature profiles in a plane jet. The calculation showed that Pr_t was 0.6 at the centerline, decreased to about 0.4 where the flow became intermittent before increasing through the intermittent region to a value of about 1.0. The authors present measured values of Pr_t in the selfpreserving region of a slightly heated plane jet and discuss them in the context of previously reported distributions for Pr_t. (11 refs.)

118656 Adjacent flow of two immiscible dusty fluids. E.C.Sekharan, G.Ramanaiah (Dept. of Math., Madras Inst. of Technol., Madras, India).
Indian J. Technol., vol.21, no.3, p.89-93 (March 1983). [received: Oct. 1983]
Unsteady, adjacent, laminar flow of two immiscible dusty viscous fluids between two infinitely long parallel plates driven by a constant pressure gradient is considered. Finite difference technique has been applied to obtain numerical solutions for velocities of fluids and dust particles. Also the stress at the two plates and at the interface and the volume flow rates have been computed and the influence of dust parameters on these values are investigated. In each case the results are compared with those of clean fluids. (7 refs.)

118657 Prediction of the transit time of a stably stratified flow in a channel with inclined surface. Seung Oh (JAYCOR Inc., San Diego, CA, USA), B.K.H.Sun.
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.666-7 (Aug. 1983).
A simple correlation based on mechanistic approaches was developed for the prediction of transit time of a stably stratified flow in a channel with an inclined surface. It is shown that the model is able to correlate all the data of Rothe and Marscher (1982) for a wide range of test conditions. (7 refs.)

118658 On the steady state performance of cocurrent bubble column slurry reactors. V.M.H.Govindarao, M.Chidambaram (Dept. of Chem. Engng., Indian Inst. of Sci., Bangalore, India).
Chem. Eng. J. (Switzerland), vol.27, no.1, p.29-36 (Aug. 1983).
On the basis of the dispersion model for the gas and liquid phases and the sedimentation-diffusion model for the solid phase, the steady state performance of an isothermal cocurrent flow bubble column slurry reactor with a first-order surface reaction is analysed. The system equations are solved using the orthogonal collocation method. Numerical evaluation shows that the effects of slurry phase mixing are very significant whereas the effects of gas phase mixing are negligible. Conversion of the gas component increases with decrease in the slurry phase backmixing. This enhancement in the conversion is more pronounced at higher particle sizes and lower catalyst loadings. The conversion reaches a minimum with respect to the particle size, showing that specified conversions can be obtained with larger particles also. (9 refs.)

118659 Fluid motion and mixing in a gas-liquid contactor with turbine agitators. Y.Nagase, H.Yasui (Dept. of Chem. Engng., Hiroshima Univ., Hiroshima, Japan).
Chem. Eng. J. (Switzerland), vol.27, no.1, p.37-47 (Aug. 1983).
Gas bubble distributions, estimated from local holdup measurements, and flow profiles near the vessel wall, deduced from wall pressure measurements, were used to present a physically sound understanding of the entire flow profiles in an aerated agitation vessel with either a disc turbine or a vaned disc turbine. Essentially a single impeller speed with gas rates Q_a greater than 0.05 nd^3 was used. Typical findings were that (1) the flow field under the impeller was quite similar to that for unaerated agitation, (2) the circulation flow of liquid over the impeller was fairly restricted even with a disc turbine and (3) another narrow but steady circulation zone was formed near the wall between the liquid surface and the impeller. Mixing measurements under aeration for comparison with single-phase measurements obtained at lower speeds to maintain the same total power input confirmed point (1) above, although the total mixing rate was reduced by about 20%-30% compared with that for unaerated conditions. (18 refs.)

118660 Reciprocity theorems for a nonuniform medium. V.I.Roldugin (Inst. of Phys. Chem., Acad. of Sci., Moscow, USSR).
Colloid J. USSR (USA), vol.44, no.6, p.969-75 (Nov.-Dec. 1982). Translation of: *Kolloidn. Zh. (USSR)*, vol.44, no.6, p.1102-8 (Nov.-Dec. 1982). [received: Sept. 1983]
It has been shown that the mutuality theorems established previously within the framework of Navier-Stokes hydrodynamics lead to contradictions in the case of movement of solids in a nonuniform liquid. The Newton-Fick-Fourier laws have been modified in order to describe correctly the dynamics of solid bodies in a nonuniform liquid. A derivation is given for new reciprocity theorems from modified transport equations. (8 refs.)

118661 Thermal polarization of solids in a rarefied gas flow. S.P.Bakanov, V.V.Vysotskii (Dept. of Surface Phenomena, Acad. of Sci., Moscow, USSR).
Colloid J. USSR (USA), vol.44, no.6, p.1014-16 (Nov.-Dec. 1982). Translation of: *Kolloidn. Zh. (USSR)*, vol.44, no.6, p.1156-8 (Nov.-Dec. 1982). [received: Sept. 1983]
The thermal polarization of solids in a rarefied gas flow, predicted from theory has been investigated experimentally. The experimental results have corroborated the correctness of the physical concepts forming the basis of the theory. The coefficients of thermal slip, energy accommodation, and tangential pulse have been determined for argon and helium atoms on glass. (1 ref.)

118662 Effect of boundary absorption upon longitudinal dispersion in shear flows. R.Smith (Dept. of Appl. Maths. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).
J. Fluid Mech. (GB), vol.134, p.161-77 (Sept. 1983).
Boundary absorption causes a depletion of contaminant. Since the boundary tends to be the region of lowest velocity and of strongest shear, the remaining contaminant experiences on average an increased advection velocity, a reduced rate of shear dispersion, and a tendency to develop skewness towards the rear. The author shows how all these effects can be incorporated into a delay-diffusion description of the longitudinal dispersion process (Smith 1981). It is the accurate reproduction of the skewness that permits a delay-diffusion equation to become applicable at an earlier stage than the more conventional diffusion-equation models for longitudinal dispersion, and before there has been an undue loss of contaminant through the boundary. (19 refs.)

118663 Some remarks on 'Drag coefficients of a slowly moving sphere in non-Newtonian fluids' [and reply]. R.P.Chhabra (Dept. of Chem. Engng., Univ. Coll. of Swansea, Swansea, Wales), Y.I.Cho, J.P.Hartnett.
J. Non-Newtonian Fluid Mech. (Netherlands), vol.13, no.2, p.225-31 (Sept. 1983).
In a recent paper, Cho and Hartnett (ibid., vol.12, no.2, p.243, 1983) revisited the problem of creeping motion of a rigid sphere in a power-law liquid. The main contribution of the paper seems to lie in the fact that the upper and lower bounds on the drag force experienced by a sphere in power-law liquids obtained by Cho and Hartnett represent a small degree of improvement over those obtained by Wasserman and Slattery (1964). The upper bound (corresponding to the ratio of viscosity of dispersed phase to viscosity of continuous phase equal to 1000) coincides with that given by Cho and Hartnett in the range $1>n>0.5$. Likewise, it is now generally agreed that the original calculations of lower bound given by Wasserman and Slattery are in error and, in fact, corrected results based on a three-parameter stress profile were obtained, by Mohan and Venkateshwarlu and independently by Yoshioka and Adachi (1977/8). Indeed the trial stress profile employed by Cho and Hartnett is a special case of that used by Mohan and Venkateshwarlu (1976). Cho and Hartnett have not presented a comparison between theory and experiments to substantiate their analysis, although a considerable amount of experimental data are available in the literature. In Chhabra's view such a comparison provides the most direct assessment of any theoretical treatment. Such a comparison is presented. Cho and Hartnett respond to Chhabra's criticism. (25 refs.)

118664 On two phase filtration under gravity and with boundary infiltration: application of a Backlund transformation. C.Rogers (Dept. of Appl. Maths., Univ. of Waterloo, Waterloo, Ontario, Canada), M.P.Stallybrass, D.L.Clements.
Nonlinear Anal. Theory, Methods & Appl. (GB), vol.7, no.7, p.785-99 (1983).
A nonlinear boundary value/initial value problem is presented which describes one-dimensional two-phase flow under gravity in a semi-infinite porous reservoir with constant boundary injection. The problem is reduced to a linear boundary value/initial value problem via the application of two successive Backlund transformations. (3 refs.)

118665 Diffusive, electrostatic, and gravitational deposition of suspensions in the entrance of a nozzle. T.A.Korjack (Energy Conversion Res. Section, Philadelphia Electric Co., Philadelphia, PA, USA).
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.1, p.1-7 (March 1983). [received: Oct. 1983]
An analytical investigation of the mechanics of deposition affected by gravity, electrostatic charge, and Brownian motion in an effuser from the nozzle inlet to a distance where incompressible effects are still valid has been made and a mathematical model developed for the deposition process. The analysis was restricted to laminar flow of dilute, nonreactive suspensions contained with an incompressible, viscous carrier. The results show that increasing the nozzle angle causes a decrease in deposition rate regardless of the diffusive Peclet number and gravity flow parameter. Furthermore, an increase in gravity field causes an increase in bottom deposition rate and decrease in top deposition rate. (12 refs.)

118666 Metering of gas-liquid two-phase flow by sharp-edged orifices and the effect of fluid compressibility on experimental results. Zhao Zaisan, Chang Yunfa, Xu Yinlong, Chen Zhihang (Shanghai Inst. of Mech. Engng., Shanghai, China).
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.45-52
Previous work by various workers on the subject is reviewed and, using separated flow momentum model, a theoretical analysis of the gas-liquid two-phase flow through sharp-edged orifices is made. From the two-phase flow differential equation as applied to an incompressible fluid, the basic equation of the separated flow model for a two-phase mixture passing through a sharp-edged orifice is derived. The effect of the difference in the values of the area ratio m of the orifice on the experimental results is also dealt with and a conclusion is reached that the effect of m on the experimental results arises mainly from the compressibility of the two-phase fluid. (19 refs.)

118667 Evaluation of steady flow profiles in rectangular and circular packed beds by a variational method. D.Vortmeyer, J.Schuster (Fakultat fur Maschinenwesen, Tech. Univ. Munchen, Munchen, Germany).
Chem. Eng. Sci. (GB), vol.38, no.10, p.1691-9 (1983).
The Brinkman equation is solved by an equivalent variational problem in order to obtain steady flow profiles which satisfy the conditions $w=0$ and $\epsilon=1$ at the container wall of a packed bed. The quite large deviations between calculated and measured profiles are fully explained. An analytical expression is developed with sufficient accuracy. The main body of calculations is performed for isothermal flow, however flows under non-isothermal conditions also are considered. (29 refs.)

118668 Mass transfer studies in porous electrodes: application of the limiting current technique. M.Benzina (Ecole Nat. D'Ingenieurs de Gabes, Gabes, Tunisia), D.Mowla, G.Lacoste.
Chem. Eng. J. (Switzerland), vol.27, no.1, p.1-7 (Aug. 1983).
The limiting current technique is used to obtain the liquid-solid mass transfer coefficient in two types of fixed electrochemical reactor at low Reynolds numbers. The first reactor is a cylindrical radial flow porous electrode, and the other is a conical axial flow porous electrode. In each case the porous electrode is made of copper particles which are percolated by a dilute solution of Cu^{2+} ions in a sulphuric acid medium. On calculating the electrode yield by measuring the inlet and outlet concentration of electroactive agent, the authors found a correlation between the Reynolds number Re and the Sherwood number Sh. With the present operating conditions, for $0<\mathrm{Re}<45$, $\mathrm{Sh}=2.277\ \mathrm{Re}^{1/3}\mathrm{Sc}^{1/3}$. (18 refs.)

118669 Nonlinear unstable wave disturbances in fluidized beds. J.T.C.Liu (Div. of Engng., Brown Univ., Providence, RI, USA).
Proc. R. Soc. London Ser. A (GB), vol.389, no.1797, p.331-47 (8 Oct. 1983).
Instabilities in fluidized beds are interpreted from the two-phase continuum theory of linearized hydrodynamic stability as the result of interactions between wave hierarchies for which the stability condition is violated; that is, in which the lower-order waves. For weak nonlinearities a hierarchy of burgers-like equations is obtained. The nonlinear modifications to the wave speeds point towards the restoration of the stability condition in the linearized sense. A weakly nonlinear hydrodynamic stability analysis yields an amplitude equation that is of second order. It is argued, however, that the major history of the disturbance development may be expressed by a simpler first-order amplitude equation. The Landau-Stuart constant obtained is intimately related to the nonlinear modifications of the wave speeds of the higher-and lower-order wave operators. It is shown that for supercritical disturbances, amplitude and phase velocity equilibration is possible, and that the levels of the equilibration depend on the initial amplification rate, in agreement with observations. The equilibration occurs by cascades of the fundamental wave disturbance into its harmonics. (27 refs.)

118670 Single-blow transients in packed-bed storage units with solid-phase conduction by Crump's numerical inversion of Laplace transforms. P.-C.Lu (Dept. of Mech. Engng., Univ. of Nebraska, Lincoln, NE, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.493-7 (Aug. 1983).
A robust and fast scheme for the numerical inversion of Laplace transforms, recently established by Crump, is applied to the linear problem of two-phase (solid-and-fluid) response of a packed-bed thermal storage unit during a single-blow operation, with solid conduction in the flow direction properly considered (while neglecting the conduction and energy storage in the fluid). The scheme is shown to be capable of handling implicit solutions in the transformed domain, which are themselves to be calculated numerically on a computer. The numerical results compare very well with those obtained by other methods of attack. The comparison also discloses some rather large errors in a set of data generated by a finite difference scheme as reported in the literature. (14 refs.)

118671 Analysis of coolant entrance boundary shape of porous region to control cooling along exit boundary. R.Siegel, A.Snyder (Lewis Res. Center, NASA, Cleveland, OH, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.513-18 (Aug. 1983).
A cooled porous region has a plane surface exposed to a specified spatially varying heat flux. The coolant leaves the region through this surface, and it is desired to control the flow distribution to maintain a specified uniform surface temperature. This is accomplished by having the coolant entrance surface shaped to provide in the region the necessary variation of path length and, hence, flow resistance. The surface shape at the coolant entrance is found by solving a Cauchy boundary value problem. An exact solution is obtained that will deal with a wide variety of heating distributions for both two- and three-dimensional shapes. (7 refs.)

47.60 FLOWS IN DUCTS, CHANNELS, AND CONDUITS

(for biological fluid dynamics, see 87.45)

118672 Longitudinal vortices in wind tunnel wall boundary layers. S.Mokhtari, P.Bradshaw (Dept. of Aeronautics, Imperial Coll., London, England).
Aeronaut. J. (GB), vol.87, no.866, p.233-6 (June-July 1983).
Longitudinal vortices in wind tunnel wall boundary layers near the centre line of each wall have been found. This is important in wind tunnels whose contraction ratios are not sufficiently large for the boundary layer thickness at exit to be negligible. The phenomena was experimentally investigated. The main result is that the thickening and distortion of the wind tunnel floor boundary caused by longitudinal vortices is not necessarily visible at the contraction exit. This is a warning against the assumption that because the boundary layer at the exit is normal it will remain normal thereafter. (7 refs.)

118673 A test of the validity of Jenike's velocity profiles. A.M.Munawer (Dept. of Chem. Engng., Mehran Univ. of Engng. & Technol., Jamshoro, Pakistan).
Mehran Univ. Res. J. Eng. & Technol. (Pakistan), vol.2, no.1, p.39-42 (Jan. 1983). [received: Sept. 1983]
The radial flow stress fields and velocity profiles of Jenike and Shield (see Journal of Appl. Mechs., vol.26, p.599, 1959) have been used in the theory for the rate of dissipation due to the internal friction and wall friction in the flow in a cone. The validity of Jenike's velocity profiles is tested by comparing the total loss of potential energy of material flowing through two spherical control surfaces. The result is that if the Jenike velocity profiles are valid then the ratio of potential energy change to energy dissipation should be one. The sensitivity of the energy balance to the velocity profile is also tested by assuming simple linear dimensionless velocity profiles. This shows that energy balance is very sensitive to the velocity profile mainly because it depends on an interaction between the gradient of the velocity profile and the amount of material through the elements of larger cross-section nearer the hopper wall which also depends on the velocity profile. (4 refs.)

118674 Net molecular flow conductance of series elements. V.E.Stubblefield (McDonnell Douglas Corp., St. Louis, MO, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1549-52 (1983).
The problem of calculating the total molecular flow conductance of ductwork made up of series connections of elements of known conductance is discussed from the transmission probability point of view. Cases in which there is a discontinuity in cross section between adjacent elements are included. Two criteria for evaluating methods for this calculation are discussed and applied to two such methods. One method, which includes a short procedure for treating discontinuities in duct cross section is shown to satisfy both evaluation criteria. (4 refs.)

118675 Non-isothermal flow of non-linear viscous-ductility liquid in a plane channel with a viscous wall layer. Kh.T.Bektashi.
Izv. Akad. Nauk Az. SSR Ser. Fiz.-Tekh. & Mat. Nauk (USSR), no.1, p.145-8 (1983). In Russian.
Investigates the influence of the viscous heat dependence of the plastic viscosity and ultimate stress of the shift from the temperature on the hydraulic characteristics of the laminar regime of the motion in a plane channel nonlinear viscous ductility medium with a viscous wall layer. (6 refs.)

118676 Extrudate swell for a round jet with large surface tension. H.A.Tieu, D.D.Joseph (Dept. of Aerospace Engng. & Mech., Univ. of Minnesota, Minneapolis, MN, USA).
J. Non-Newtonian Fluid Mech. (Netherlands), vol.13, no.2, p.203-22 (Sept. 1983).
The problem of extrudate swell of a viscoelastic fluid from a round pipe is studied by the method of domain perturbations. The perturbation problems are solved by a finite-element method through second-order in the flow rate parameter ϵ for small flow rates. The analysis extends the work of Sturges (1981) on swelling in two-dimensional channels to round capillary tubes. In perturbation studies for small ϵ, the rheology of the fluid may be expressed by three parameters, the viscosity and the two constants α_1 and α_2 appearing at order two in the expansion of the extra stress around zero shear. Surface tension has an important influence on the shape of the jet at low speeds. The shape of the surface on a round jet depends on α_1 and α_2, in the plane jet only on α_1. The analysis predicts that no matter what the constitutive equation may be, the jet will first contract if the radius of the pipe is sufficiently small. The contraction takes place in a length less than 1/10 the diameter of the jet and is followed by a swell. The contraction is usually small and may be hard to observe. There are five different contributions to the jet shape at second-order but only the viscoelastic ones persist as the pipe radius goes to zero. (14 refs.)

118677 Experiments on a crossflow heat exchanger with tubes of lenticular shape. E.K.Ruth (California Inst. of Technol., Pasadena, CA, USA).
Trans. ASME. J. Heat Transfer (USA), vol.105, no.3, p.571-5 (Aug. 1983).
Measurements of pressure losses and heat transfer rates were made for an unconventional crossflow heat exchanger with tubes of lenticular cross section so spaced to reduce variation in the velocity of the fluid outside the tubes, thus reducing separation and drag. The results of these experiments are reported for various tube spacing and demonstrate that the performance of the lenticular tube heat exchanger is superior to that of conventional circular tubes by 20 percent at Reynolds numbers of 20000 to 50000. (10 refs.)

118678 Unified approach to the solution of problems of unsteady laminar flow in long pipes. M.F.Letelier S (Dept. de Ingenieria Mecanica, Univ. de Santiago de Chile, Santiago, Chile), H.J.Leutheusser.
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.1, p.8-12 (March 1983). [received: Oct. 1983]
Presents a unified approach to the solution of laminar pipe-flow transients in which the forcing function may depend on the motion itself. The key to the solution procedure is a power series expansion of the local velocity in terms of radial position, involving a single time-dependent coefficient. The method of analysis is applied to the solution of two particular cases of transients, namely flow establishment, with and without inflow, respectively. It is found to yield results that are in excellent agreement with other known analytical solutions and experimental observations. (8 refs.)

118679 A numerical investigation for curved pipe flow at high Reynolds number. M.Holt (Dept. of Mech. Engng., Univ. of California, Berkeley, CA, USA), W.-S.Yeung.
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.2, p.239-43 (June 1983).
A numerical scheme for solving the curved pipe flow at high Reynolds number is presented in considerable detail. An efficient scheme based on the conventional Telenin method is developed to solve the general three-dimensional Laplace equation subject to Dirichlet, Neumann, or mixed boundary conditions. (7 refs.)

118680 On transverse secondary flows in wave channels. R.E.Johnson (Dept. of Theoretical & Appl. Mech., Univ. of Illinois, Urbana, IL, USA).
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.2, p.244-50 (June 1983).
The viscous boundary layer analysis for the sidewalls of a wave tank is presented for the case of two-dimensional waves of small amplitude traveling along the channel length. The second-order transverse streaming motion induced in the interior of the channel by the sidewall layers is determined. The calculations extend the work of Mei and Liu (1972) which examined the effect of sidewalls on the longitudinal streaming motion. The intensity of the transverse streaming flow is found to increase as the depth to wavelength ratio decreases, and is found to be significant for typical wave tanks that generally have a depth to width ratio between one-half and one-fourth. The present results are useful if accurate conclusions concerning mass transport in the open ocean are to be made from laboratory studies. Furthermore, the results may offer an explanation for some of the laboratory observations already in the literature. (15 refs.)

118681 Flow inside a pneumatic tire: a peristaltic-pumping analysis for the thin-tire limit at very low forward speed. W.J.Rae (Aerodynamic Res. Dept., Calspan Corp., Buffalo, NY, USA).
Trans. ASME. J. Appl. Mech. (USA), vol.50, no.2, p.255-8 (June 1983).
The flow inside a pneumatic tire is analyzed in the limit where the cross-sectional diameter of the tire is small in comparison to the wheel diameter, and where the forward speed is sufficiently low that centrifugal pressure gradients can be neglected. The movement of the contact point around the circumference of the tire produces an internal flow by a mechanism analogous to peristaltic pumping in long flexible ducts. Analytic expressions for the flow velocities and pressures predicted by this model are derived, and are related to tire velocity and load. (4 refs.)

118682 Three dimensional model of turbulent exchange using pulsation energy balance equation. N.I.Buleev, G.A.Zinina.
Vestsi Akad. Navuk BSSR Ser. Fiz. Energ. Navuk, no.3, p.36-46 (1983). In Russian.
The authors use the turbulent energy balance equation instead of the Prandtl-Karman generalization of three-dimensional fluid flows. This approach allows calculation of the hydrodynamic and thermal starting sections of channels. Half-empirical constants of the balance equation have been refined by numerical solution for the motion and heat influx equations for steady-state turbulent fluid flows in a circular tube. (14 refs.)

118683 Pulsative fluid flow caused by a PD meter. T.Kawase (Waseda Univ., Tokyo, Japan), T.Machiyama.
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.873-83
Pulsating fluid flow caused by a roots flowmeter, and its nonsteady rotor motion are investigated both analytically and experimentally. The dynamic interaction between the rotor motion and the fluid wave along the pipe line is predicted using the proposed model, the effects of the piping configurations upon the dynamic interaction are quantitatively estimated, and explicit expressions to estimate dynamic quantities such as pressure, flow rate and the angular velocity of the rotor are presented. These estimated results were fairly well confirmed by experiments. A simple and practical method to reduce such fluid pulsation is proposed and its effectiveness is examined using the field test data. (2 refs.)

47.65 MAGNETOHYDRODYNAMICS AND ELECTROHYDRODYNAMICS

(for MHD in plasma, see 52.30)

118684 Two-dimensional behaviour of MHD fully developed turbulence ($Rm \gg 1$). J.Sommeria (Inst. de Mecanique, Univ. de Grenoble, Grenoble, France).
J. Mec. Theor. & Appl. (France), spec, suppl., p.169-90 (1983).
Deals with the two-dimensional properties of liquid metal channel flows under the influence of a strong uniform steady transverse magnetic field. After a short account of the theoretical background, experimental results on the subject are reviewed, emphasizing grid turbulence. Then, a new experimental study is set out, showing the relatively slow decay of the turbulent energy in

a strong magnetic field, and a spectral evolution in $t^{-2} k^{-3}$. These spectra are partly indicative of an enstrophy cascade, the dynamics of the smaller scales being three-dimensional and involving a strong Joule dissipation. Finally, measurements of turbulent heat diffusion along two perpendicular directions illustrates the two-dimensionality of the large eddies and allow interesting comparisons with theories of pairs dispersion in two-dimensional homogeneous turbulence. (20 refs.)

118685 The dynamics of two-dimensional ideal MHD. U.Frisch, A.Pouquet, P.-L.Sulem (CNRS, Obs. de Nice, Nice, France), M.Meneguzzi.
J. Mec. Theor. & Appl. (France), spec, suppl., p.191-216 (1983).
Magnetohydrodynamic (MHD) flow that have high Reynolds number and high magnetic Reynolds number can display violent small-scale phenomena near magnetic neutral points: formation of current sheets, subsequently leading to reconnection processes, tearing mode instabilities, particle accelerations by strong electric fields, etc. In order to understand the earliest stages of current sheet formation the authors have performed a number of numerical experiments with ideal (nondissipative incompressible) two dimensional MHD flows. The authors used periodic boundary conditions and spatial resolutions up to 512^2. For the initial conditions of ORSZAG and TANG (1979) and other flows having neutral points of the X-type, the authors found that vorticity and current grow exponentially in time. The small-scale activity that develops near neutral points is concentrated in quasione dimensional sheet-like structures: as a consequence, nonlinear interactions are strongly inhibited. This geometric feature of the flow is not captured by closure calculations which for ideal 2-D MHD predict blow-up of r.m.s. vorticity and current at a finite time (Pouquet 1978). In the absence of neutral points, the evidence is that Alfven waves prevent the development of motions of arbitrary small scales. (45 refs.)

118686 Stability of convection rolls in the presence of a horizontal magnetic field. F.H.Busse, R.M.Clever.
J. Mec. Theor. & Appl. (France), vol.2, no.4, p.495-502 (1983).
Convection rolls in a horizontal layer of an electrically conducting fluid heated from below are aligned with the direction of the horizontal component of a homogeneous magnetic field intersecting the layer as long as the Rayleigh number is close to its critical value. The authors investigate the influence of a purely horizontal magnetic field on the onset of three-dimensional instabilities in the limit of high magnetic diffusivity and low viscosity. It is found that the Lorentz force exerts a stabilizing influence on the onset of the oscillatory instability and that the region of stable roll solutions is enlarged considerably. Some nonlinear aspects of three-dimensional finite amplitude convection are considered and it is shown that a mean flow is likely to be generated in the presence of an inclined magnetic field. 47.80 INSTRUMENTATION FOR FLUID DYNAMICS

118687 Design of supercritical cascades with high solidity. J.Sanz (Univs. Space Res. Assoc., Columbia, MD, USA).
AIAA J. (USA), vol.21, no.9, p.1289-93 (Sept. 1983).
The method of complex characteristics of Garabedian and Korn (1977) has been used successfully to design shockless cascades with solidities of up to one. A new code has been developed using this method and a new hodograph transformation of the flow onto an ellipse. This new code allows the design of cascades with solidities of up to two and larger turning angles. The equations of potential flow are solved in a complex hodograph-like domain by setting a characteristic initial-value problem and integrating along suitable paths. The topology that the new mapping introduces permits a simpler construction of these paths of integration. (6 refs.)

118688 Heavy gas mixtures for wind tunnel use. S.K.J.Al-ani, E.A.Johnson (Dept. of Phys., Univ. of Surrey, Guildford, England).
Aeronaut. J. (GB), vol.87, no.866, p.237-40 (June-July 1983).
The advantages of using heavy gases in wind tunnels are reduced power consumption and scale size. To be sure of correct scaling of the results from such a tunnel, the working fluid should have a specific-heat-ratio γ equal to that of air ($\gamma=1.4$); such a fluid can be obtained as a mixture of a monatomic gas with a polyatomic one. General principles for choosing such a mixture are discussed, and estimates are given for the savings in size and scale which may be expected compared to a conventional tunnel. (5 refs.)

118689 Flow characteristics in the curved rectangular channels. Visualization of secondary flow. S.Sugiyama, T.Hayashi (Dept. of Mech. Engng., Osaka Inst. of Technol., Osaka, Japan), K.Yamazaki.
Bull. JSME (Japan), vol.26, no.216, p.964-9 (June 1983).
In order to clarify the secondary flow pattern which appears in curved rectangular channels, flow visualization is made in a fully developed laminar flow. The channels have aspect ratios ranging from 0.5 to 2.5, curvature ratios ranging from 5 to 8 and width of 20 mm. From the experimental results the developing process of secondary flow vortices becomes clear. At a retarded layer near the outer concave wall, additional counter rotating pairs of vortices are observed. The critical Dean number takes the minimum and maximum values at the aspect ratios of about 1 and 2, respectively. The critical Dean number increases rapidly with decreasing aspect ratio when it is smaller than 1. (9 refs.)

118690 The flow around an oscillating sphere. II. The measurement of unsteady drag. T.Urakawa (Dept. of Mech. Engng., Chiba Inst. of Technol., Chiba, Japan), K.Takahashi.
Bull. JSME (Japan), vol.26, no.216, p.978-85 (June 1983).
For pt.I see Trans. Jpn. Soc. Mech. Engng., vol.47, no.413, p.23 (1981). Deals with the measurement of the unsteady drag on an oscillating sphere in a uniform flow. Two dynamic load transducers with high sensitivity were made for measuring the unsteady drag. These devices were proved to be useful by measuring the steady drag and the inertial force of the moving part. The time lapse of the drag and the dependence of its amplitude on parameters are shown in the case where the oscillating motion of the sphere strongly affects the flow. Furthermore, the effects of inertia and viscosity on the unsteady drag are discussed. (9 refs.)

118691 The use of coloured smoke to visualize secondary flows in a turbine-blade cascade. C.H.Sieverding (Von Karman Inst. for Fluid Dynamics, Rhode Saint Genese, Belgium), P.Van den Bosche.
J. Fluid Mech. (GB), vol.134, p.85-9 (Sept. 1983).
A coloured-smoke-visualization technique has been developed for the investigation of complex three-dimensional fluid flows. In particular, a coloured-smoke wire technique is used for the study of secondary flows in straight turbine cascades. Based on a large number of photographs and direct flow observation, the evolution of horseshoe and passage vortices through a high-turning turbine-blade passage is described. (2 refs.)

118692 Interfacing digitized Disa anemometer output to an Apple II computer. J.A.Hardcastle, R.Shaw, M.Shigemi (Mech. Engng. Dept., Univ. of Liverpool, Liverpool, England).
Microprocess. & Microsyst. (GB), vol.7, no.7, p.314-19 (Sept. 1983).
Digitized data from a hot-wire anemometer can be used by an Apple II to calculate the properties of a fluid system. The authors describe the interface and software control. (2 refs.)

118693 A small orifice flowmeter. K.Shiba, T.Ichinose, T.Yamaguchi (Faculty of Engng., Toyoto Univ., Saitama, Japan).
Oyo Buturi (Japan), vol.52, no.6, p.537-43 (June 1983). In Japanese.
The small orifice flowmeter here reported is designed to measure small flowrates. The diameters of trial orifices are 5.0 mm, 2.5 mm, 1.5 mm respectively. The upstream side of the orifice hole is rounded. The tap of downstream side is made in the orifice plate itself. The experimental results for water and spindle oil show that the trial orifice flowmeters are capable of measurement of small flowrates less than 0.5 cm^3/s. Such an orifice flowmeter has several advantages which are excellent interchangeability, good machinability and constant flow coefficient independent of Reynolds number, for a wide range of flowrates. (2 refs.)

118694 Evaluation of the usefulness of a mathematical model of a thermal flow meter for designing purposes. E.Dyakowska, M.Turkowski (Politech. Warszawkiej, Warsaw, Poland).
Pomiary Autom. Kontrola (Poland), vol.29, no.4, p.111-13 (April 1983). In Polish. [received: Sept. 1983]
The authors present a simplified mathematics model of a thermal flow meter. A comparison has been made of characteristics of two types of such flow meters, calculated on the basis of the theoretical model, with those of the prototypes constructed. A conformity has been obtained sufficient for designing purposes between the theoretical and experimental results for a flow meter of constant power rating. An analysis is also made of influence of the simplifications assumed on a discrepancy between theory and practice. (4 refs.)

118695 An ultraconic flowmeter—wave meter UMP-10. K.Kolodziej, R.Wawrzyniak (Zaklad Doswiadczalny Stechpan, Warsaw, Poland), S.Walus.
Pomiary Autom. Kontrola (Poland), vol.29, no.6, p.181-3 (June 1983). In Polish.
Operation principle and design features of an ultrasonic flowmeter-water meter built in the 'Techpan' plant, Warsaw are described. Test results confirming the predicted measurement accuracy for a real value of the velocity distribution correction factor are presented. (9 refs.)

118696 Wind tunnel flow quality and data accuracy requirements. F.Steinle, E.Stanewsky.
Report AGARD-AR-184, AGARD, Neuilly sur Seine, France (Nov. 1982), iii+26 pp.
This report is written by the Wind Tunnel Testing Techniques (TES) Subcommittee of the AGARD Fluid Dynamics Panel. It deals with flow quality and data accuracy requirements for wind tunnel testing. The emphasis is on transonic test conditions. Two conveners, one from each side of the Atlantic, were appointed by the TES Subcommittee. The conveners brought together the foremost workers for purposes of discussing the current level of testing technology, what are the requirements of the future, and what needs to be done. It was found in more than a few situations, the requirements for data accuracy and flow quality are not well defined. The requirements that are compiled represent the current thinking. To aid in understanding the impact of flow quality and data accuracy, included in this study is a detailed examination of their contributions to the test results of a transport-type configuration. The approach can be adapted to other types. The results of this effort correlate well with what is generally accepted. (33 refs.)

118697 A digitized telemetric system for transient phenomenon measurement [underwater explosion]. Qian Qiaonian (Inst. of Mech., Acad. Sinica, Peking, China).
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.63-72
An analysis is made of the features of the signals generated by the gauge in an underwater explosion, requirements for measuring the explosion and problems associated with oscilloscope-photograph recordings. A new digitized telemetric system for measuring underwater explosive pressure is introduced. Typical data acquired in actual explosions are given. (4 refs.)

118698 Vortex flowmeter: concept and application. D.K.Lyle (Fisher Controls Internat. Inc., Marshalltown, IA, USA).
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.473-82
The basic principle of vortex generation, reviews the relative advantages of the vortex meter over the traditional technique of differential pressure measurement and provides a general scope for vortex meter applications in process control. (5 refs.)

118699 A magnetic flowmeter with conducting pipe wall. H.Yamasaki, S.Honda, T.J.Chin (Univ. of Tokyo, Tokyo, Japan), C.Akiyama.
MICONEX '83 Proceedings of a Multinational Instrumentation Conference, Shanghai, China, 12-16 April 1983 (Research Triangle Park, NC, USA: ISA 1983), p.785-92
The internal pipe wall of magnetic flowmeters should be nonconductive to prevent generation of electromotive force from short circuiting. This is usually

achieved by lining the metallic pipe with insulating material. The lining material limits applicable temperature range of the measured fluid and also reliability of the meter. the objectives of this investigation are to eliminate the lining and to improve reliability and performance of the magnetic flowmeter. A potential distribution is formed over the pipe wall by applying electric current proportional to the fluid flowrate. The potential distribution over the wall is kept almost identical to the flow induced potential in the liquid so that no current flows across the boundary between fluid and wall. Therefore the output signal is exactly the same as that of conventional magnetic flowmeters. Theoretical analysis and experimental results are described. (5 refs.)

47.90 OTHER TOPICS IN FLUID DYNAMICS

118700 Decay of electromagnetic waves in fluids. G.M.Kremer (Dept. of Phys., Univ. Federal do Parana, Curitiba, Brazil), I.-S.Liu.
J. Non-Equilibrium Thermodyn. (Germany), vol.8, no.1, p.67-73 (1983).
It is known that several types of electromagnetic waves can propagate in fluids. In this work, with singular surface analysis, the behaviors of such waves propagating parallel and perpendicular to the external field are examined. In both cases, it is shown that the waves always decay provided that the electric conductivity and susceptibility are positive. (4 refs.)

51.10 KINETIC AND TRANSPORT THEORY

118701 On the gas-gas equilibria of polar-non-polar binary mixtures from a polarizable hard-sphere dipole model. O.H.Scalise, A.E.Rodriguez, F.Vericat (Inst. de Fisica de Liquidos y Sistemas Biologicos, La Plata, Argentina).
Chem. Phys. Lett. (Netherlands), vol.100, no.4, p.378-82 (16 Sept. 1983).
Perturbation theory is applied to a polarizable hard-sphere dipole model mixture. It is shown that for increasing values of the reduced polarizability of the non-polar component, gas-gas equilibria of the first and second kind can be described for a polar-non-polar binary mixture. However, for the latter case, critical lines do not show the minimum in temperature observed in real systems. Comparison between theoretical and experimental results are given for He-NH_3 and Ar-H_2O mixtures. (25 refs.)

118702 H-theorem and Onsager principle in the stationary Boltzmann equation. A.M.Bishaev, V.A.Rykov.
Zh. Vychisl. Mat. & Mat. Fiz. (USSR), vol.23, no.4, p.954-64 (July-Aug. 1983). In Russian. English translation in: *USSR Comput. Math. & Math. Phys. (GB)*
Using a kinetic approach an expression is obtained for the production of entropy in the case of a problem of surface flow. In a linear approximation it is shown that thermodynamic forces are components of the incoming flow and differences of temperature between body and gas at infinity. Components of resistive force and heat flux appear as flows. On the basis of the linear Boltzmann equation and boundary conditions which satisfy a reciprocity condition, symmetry of kinetic coefficients in the flows is shown (Onsager principle). (9 refs.) *A.G.C.*

118703 Second-order approximations for the transport properties of dilute polyatomic gases. G.C.Maitland, M.Mustafa, W.A.Wakeham (Dept. of Chem. Engng. & Chem. Technol., Imperial Coll., London, England).
J. Chem. Soc. Faraday Trans. II (GB), vol.79, pt.9, p.1425-41 (Sept. 1983).
Explicit expressions for the bulk viscosity, thermal conductivity and shear viscosity of a dilute polyatomic gas are derived. The results are correct to a second-order approximation within the framework of the semi-classical Wang Chang and Uhlenbeck kinetic theory (1964). The effective cross-sections which determine the transport coefficients have been reduced to threefold collision integrals over the inelastic differential scattering cross-section for binary molecular encounters. (see also 52. Plasma and electric discharges)

118704 Calculation of electron swarm parameters in fluorine. M.Hayashi, T.Nimura (Nagoya Inst. of Technol., Nagoya, Japan).
J. Appl. Phys. (USA), vol.54, no.9, p.4879-82 (Sept. 1983).
Swarm parameters of electrons have been calculated for fluorine by a Monte Carlo simulation and the Boltzmann equation method for the first time. Values of these parameters have been obtained for ratios of the electric field to the gas number density E/N from 100 to 3000 Td (E/p_0=35-1000 V/cm Torr). Available experimental and theoretical cross sections were used for the calculations. (18 refs.)

118705 Laue distribution of large values of time delay of electrical breakdown in nitrogen. M.M.Pejovic (Faculty of Electronic Engng., Univ. of Nis, Nis, Yugoslavia), B.J.Mijovic, Dj.A.Bosan.
J. Phys. D (GB), vol.16, no.10, p.1953-7 (14 Oct. 1983).
This paper gives the Laue distribution of time delay of electrical breakdown (t_d) for five pressure values of nitrogen in gas-filled diodes. Distributions were obtained for 20% overvoltage, and passive time (τ) 5 s and 7.2×10^3 s. The breakdown in nitrogen is induced by long-lived metastable states formed in the previous gas ionisation. The results show that the Laue distributions also hold for such groups of data when t_d varies between a fraction of a second and several hundreds of seconds. (15 refs.)

(for liquids, see 75.)

118706 Linearization of the magneto-optic signals produced by the Voigt effect in atomic vapors. R.Stephens (Dept. of Chem., Dalhousie Univ., Halifax, Canada).
Spectrochim. Acta Part B (GB), vol.38B, no.8, p.1077-86 (1983).
General formulae are derived to describe the formation of linear magneto-optic signals. The formulae allow the efficiency of any optical linearisation element to be determined once the Jones matrix of the device is known. The introduction of background optical transmission is an unwanted but unavoidable result of any linearization process which employs passive optical components. Under suitable conditions it is found that a rotated variable retardation plate approximates to an ideal linearizing element for either dichroic or birefringent signals. Theoretical results are compared with experimental measurements on the Na 589.0 nm line. (20 refs.)

51.70 OPTICAL PHENOMENA IN GASES

(for liquids, see 78.)

118707 Dispersion relations and sum rules in the Faraday effect. M.T.Thomaz (Phys. Dept., Univ. of Wisconsin, Madison, WI, USA).
Phys. Rev. B (USA), vol.28, no.6, p.3057-63 (15 Sept. 1983).
Dispersion relations and sum rules are obtained for a gaseous insulating medium, under the influence of a weak constant external magnetic field. The application of the causality principle to the constitutive equation of the medium together with the behavior of free electrons in the high-frequency limit give the analytic behavior of the optical constants in the upper half complex plane, new dispersion relations, and new sum rules. The fact that the average refractive index, as well as the difference of the complex refractive indices of right and left circularly polarized waves, satisfies dispersion relations is justified by the application of relativistic causality. (11 refs.)

118708 Coherent polarization methods of nonlinear spectroscopy of a gas in a longitudinal magnetic field. V.P.Mishchenko (Inst. of Radiophys. & Electronics, Acad. of Sci., Ukrainian SSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.7, p.542-53 (July 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.7, p.761-72 (July 1982). [received: Sept. 1983]
New polarization methods are proposed for the independent determination of the three relaxation constants of the gaseous transition $J=0 \rightarrow J=1$ with a large Doppler broadening. The methods consist of recording the polarization signal of a test field at the parametric frequency with saturating and weak (auxiliary) fields present, along with the use of coherent four-photon processes in a degenerate transition in a magnetic field. It is shown how it is necessary to select the polarizations, initial phases, frequency detunings and field intensities, as well as the amount of Zeeman splitting, in order to observe in the spectrum of the parametric radiation nonlinear resonances spaced in frequency or magnetic field which contain information about the three constants. The possibilities of the magnetoscopic and spectroscopic methods for determining the characteristics are analyzed. (17 refs.)

118709 A heat transfer study for a partially immersed refractory rod in a plasma. P.Meubus, A.Charette (Dept. of Appl. Sci., Univ. du Quebec, Quebec, Canada).
Chem. Eng. Sci. (GB), vol.38, no.10, p.1741-6 (1983).
The thermal behavior of a tungsten rod partially immersed in a plasma flame is analyzed. The longitudinal temperature profiles are obtained by numerical solution of the heat balance equation. A heat transfer model consisting of pure natural convection up to the plasma outer edge and forced convection inside the plasma, fails to predict temperatures at the hot tip of the rod. In order to make the experimental and calculated profiles to converge, one has to consider modifications in the mechanical and thermal conditions of the surrounding medium due to the presence of the rod in the plasma. This leads to the use, in the 'cold' gas zone, of particular values of heat transfer coefficient h and of a parameter T_x which is defined only at the immediate boundary of the rod. The latter are given in the form of variations along the axis of the rod. This perturbation effect decreases with the rod diameter. Allowance is made for the variation of the thermal properties of the solid. (16 refs.)

118710 Observations of odd-half cyclotron harmonic emissions in a shell-Maxwellian laboratory plasma. J.M.Urrutia, R.L.Stenzel (Dept. of Phys., Univ. of California, Los Angeles, CA, USA).
J. Geophys. Res. (USA), vol.88, no.A9, p.7086-94 (1 Sept. 1983).
Loss cone distributions have, until recently, been considered the prime cause of odd-half cyclotron harmonic emissions. On the basis of new observations, it has been proposed that shell-Maxwellian distributions are also unstable to these modes. To test this model, the authors have designed a laboratory experiment where a shell-Maxwellian distribution is produced. Analysis of the plasma noise spectrum shows that the emissions fall within the cyclotron harmonic branches (Bernstein waves). Test wave dispersion analysis, spectral correlation measurements, and real time observations indicate that the authors plasma, which has the upper hybrid resonance in the first Bernstein wave branch ($\omega_{uh}/\omega_{ce}=1.8$), exhibits a nonconvective (absolute) instability at $\omega/\omega_{ce}=1.3$, in contrast to the predictions of loss cone theory for the upper hybrid branch. In addition, the test wave dispersion relation of the plasma reveals that below the instability frequency the system behaves as if it were composed of shell electrons only. Present theories do not account for these findings. (27 refs.)

118711 A study of the VUV emission from highly ionized krypton in a theta pinch plasma. L.A.Jones (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA), E.Kallne.
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.30, no.4, p.317-26 (Oct. 1983).
The ionization rates of Kr(IX), (X), (XI), and (XII) have been measured using a fast 60 kV-60 kJ theta pinch as a plasma source. The line emission from each ion stage has been identified and the time evolution observed. A coupled set of rate equations was used along with time- and space-resolved measurements of the electron density and temperature to model the plasma light emission. The ionization rates of Kunze (1977) were adjusted by multiplying the rate for each ion stage with a constant until the peak intensity of the calculated emission agreed with the time of the observed peak intensity. The constants required for best fit were 2.5, 0.15, 3.0, and 2.0 for Kr(IX), (X), (XI), and (XII), respectively. Two successive ionization stages, Kr(X) and Kr(XI), have shown the same time dependence and possible reasons for this observation are discussed. During the course of modeling the light emission, the authors also found that the rate for the excitation from the $3d^n$ to the $3p^5 3d^{n+1}$ level in Kr(X) ($n=9$) and Kr(XI) (n=8) is a factor of 5 lower than predicted by the van Regemorter excitation rate equation. (24 refs.)

118712 Electron cyclotron emission and absorption in fusion plasmas. M.Bornatici (Facolta di Ingegneria, Univ. di Pavia, Pavia, Italy), R.Cano, O.De Barbiere, F.Engelmann.
Nucl. Fusion (Austria), vol.23, no.9, p.1153-1257 (Sept. 1983).
The state of the art in the field of electron cyclotron emission and absorption of fusion plasmas confined by a magnetic field is reviewed. The general theory is described concisely, explicit results being given mainly for plasmas in local thermodynamic equilibrium. Moreover, the practical implications of these effects with respect to cyclotron radiation losses, the use of cyclotron emission as a diagnostic tool, and electron cyclotron heating and current drive are discussed with emphasis on tokamak plasmas. (263 refs.)

118713 Gain in the 100-1000 Å range in a homogeneous stationary plasma. A.V.Vinogradov, V.N.Shlyaptsev (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.303-6 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.516-22 (March 1983). [received: Oct. 1983]
Calculations are made of the gain in a multiply charged homogeneous stationary plasma due to transitions in neon-like ions in the 100-1000 Å wavelength range. the range of electron temperatures and densities for which the maximum gain is observed in the selected element is determined. (11 refs.)

(see also 47.65 Fluid dynamics)

118714 Dispersion of a plasma cluster over a less dense plasma background. Yu.A.Berezin, P.V.Khenkin.
J. Appl. Mech. & Tech. Phys. (USA), vol.23, no.6, p.764-8 (Nov.-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR)*, vol.23, no.6, p.37-40 (Nov.-Dec. 1982). [received: Sept. 1983]
The influence of finite conductivity (Coulomb and anomalous) on cluster motion and magnetic field growth is investigated. The problem of expansion of a plasma cylinder into a rarefied plasma is modeled numerically. The model of two-fluid hydrodynamics which is simpler than the hybrid model is used. (10 refs.)

118715 Free-boundary MHD stability of pressureless oblate spheromaks—dependence on aspect ratio and elongation. C.Pfersich, R.Gruber, F.Troyon (Centre de Recherches en Phys. dcs Plasmas, Ecole Polytech. Federale de Lausanne, Lausanne, Switzerland).
Nucl. Fusion (Austria), vol.23, no.9, p.1127-34 (Sept. 1983).
Ignoring the stability effect of a conducting shell or conductors, it is found that an oblateness parameter $\epsilon=-0.3$ and an aspect ratio closest to one give optimal stability properties for a spheromak. In the pressureless case, only the n=1 tilting and, possibly, the n=2 kink modes are unstable. If these two modes are actively stabilized, appreciable beta values of a few per cent can be obtained, the limiting modes being Mercier modes with very small growth rates. (14 refs.)

118716 Application of the parallel chords method to solving implicit difference magnetohydrodynamic equations. V.A.Gasilov, T.K.Korshiya, B.Ya.Lyubimov, V.F.Tishkin, A.P.Favorskii, M.Yu.Shashkov.
Zh. Vychisl. Mat. & Mat. Fiz. (USSR), vol.23, no.4, p.936-46 (July-Aug. 1983). In Russian. English translation in: *USSR Comput. Math. & Math. Phys. (GB)*
A system of implicit difference magnetohydrodynamic equations is examined in a two-dimensional formulation. Linearization of the source equations is carried out in such a way that it leads to a system of linear equations of relatively increased coordinates of nodes of the difference network. The matrix of the system of linear equations is symmetrical and non-negative definite, which makes it possible to use effective methods for its treatment. An example of a numerical solution of a model problem is presented, dealing with the compression of a finite mass of ideally conducting plasma in a magnetic field. (14 refs.) *A.G.C.*

118717 On the bifurcation and nonuniqueness of MHD-equilibrium and Tokamak transport. G.Paris, A.Ag, A.Montvai, G.Neméth (Central Res. Inst. for Phys., Budapest, Hungary).
In *Collection of scientific papers in collaboration with joint Institute for Nuclear Research, Dubna, USSR and Central Research Institute for Physics, Budapest, Hungary. Algorithms and programs for solution of some problems in physics. Vol.IV*, p.109-25. Report KFKI-1983-21, Hungarian Acad. Sci., Budapest (1983), 191 pp.
Nonlinear MHD-equilibrium equation is investigated. By the help of the Ritz-method in a simplified form calculations are given for the Astron and for the nonlinear heat-transport problems. (4 refs.)

52.35 WAVES, OSCILLATIONS, AND INSTABILITIES IN PLASMA

118718 Excitation of the electron plasma waves in a magnetized plasma by a slow waveguiding circuit. T.Idehara (Dept. of Appl. Phys., Fukui Univ., Fukui, Japan).
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.7, p.1176-81 (July 1983).
The excitation of the electron plasma wave in a magnetized plasma (the Trivelpiece-Gould wave) is studied experimentally, using a slow waveguiding circuit surrounding the plasma column. The wave vector of the excited wave can be controlled externally. In the case of weak inhomogeneity, the group velocity v_g of the excited wave makes a right-angle with the phase velocity v_{ph}. In the lower branch of the wave $(\omega<\omega_c)$, the wave propagates as a forward wave in the axial direction and as a backward wave in the radial direction. In the upper branch $(\omega>\omega_c)$, it propagates as a backward wave in the axial direction and as a forward wave in the radial direction. (13 refs.)

118719 Direct measurement of fast magnetosonic wave near the ion-ion hybrid resonance layer by magnetic probes. K.Ida, M.Naito, S.Shinohara, K.Miyamoto (Dept. of Phys., Faculty of Sci., Univ. of Tokyo, Tokyo, Japan).
Nucl. Fusion (Austria), vol.23, no.9, p.1259-62 (Sept. 1983).
Direct measurement of the fast magnetosonic wave near the hybrid resonance layer in a deuterium-hydrogen plasma by magnetic probes is described. Externally driven waves in the ion cyclotron range of frequencies (ICRF) are excited by a half-turned antenna located on the high-field side in the TNT-A tokamak. The amplitude and the phase shift of the fast magnetosonic wave are measured by magnetic probes in the equatorial plane of the plasma. The amplitude of the fast magnetosonic wave is damped in the ion-ion hybrid resonance layer, and the wavelength changes at the high-field side near this layer. The amplitude and the phase shift of the wave as measured by the probes agree with those calculated from a cold-slab model. (14 refs.)

118720 The electron-acoustic-drift instability. A.S.Sharma, M.Mohan (Phys. Res. Lab., Ahmedabad, India), M.Y.Yu.
Phys. Lett. A (Netherlands), vol.97A, no.9, p.387-90 (26 Sept. 1983).
In an inhomogeneous plasma in a magnetic field, if the ions are much hotter than the electrons, the electron-acoustic mode couples to the drift mode and this coupling results in the electron-acoustic-drift instability. (8 refs.)

118721 Experimental study of a toroidal plasma under the conditions for adiabatic Budker-Buneman instability. A.Hirose, J.D.Paulson, H.M.Skarsgard, S.Wolfe (Dept. of Phys., Univ. of Saskatchewan, Saskatoon, Saskatchewan, Canada).
Phys. Rev. Lett. (USA), vol.51, no.13, p.1179-82 (26 Sept. 1983).
Conditions suitable for the adiabatic electron-ion-two-stream instability have been created in a toroidal plasma. Observed anomalous resistivity, turbulent heating rates, and ion plasma oscillations are in favorable agreement with the recent theoretical predictions. (15 refs.)

118722 Magnetic surface waves in plasmas. R.D.Jones (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA).
Phys. Rev. Lett. (USA), vol.51, no.14, p.1269-71 (3 Oct. 1983).
The existence of a new type of surface wave in plasmas is demonstrated. These waves are intimately connected with the self-generation of magnetic fields in the laser-plasma interaction. The waves resemble waveguide modes in that a number of discrete modes can exist. The modes are localized to within a collisionless skin depth of the surface and, in the collisionless fluid limit, there is no restriction on the distance the waves can propagate. (13 refs.)

118723 Interaction of magnetosonic solitons with quasipotential waves [plasma waves]. E.M.Gromov (Inst. of Appl. Phys., Acad. of Sci., USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.7, p.519-23 (July 1982).
Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.7, p.734-8 (July 1982).
[received: Sept. 1983]
The interaction of fast magnetosonic solitons with upper- and lower-hybrid, quasipotential waves propagating across an external magnetic field is discussed. The evolution of the spectrum of the high-frequency waves in the given field of the soliton is determined in the approximation of geometrical optics, when the wavelength of the high-frequency waves is much less than the characteristic length of the soliton. The possibility of the reflection of high-frequency wave packets from a soliton when there is positive wave dispersion $(\partial^2\omega/\partial k^2>0)$ and of capture when it is negative $(\partial^2\omega/\partial k^2<0)$ is demonstrated. The peculiarities of the transformation of the spectrum of high-frequency waves when an inflection point is present in the dispersion characteristic curve of these waves are investigated. The variation of the soliton's parameters is found in the approximation of conservation of its shape by the soliton in the presence of high-frequency waves. (8 refs.)

118724 Stochastic stabilization of the explosive instability in a nonequilibrium plasma. S.Ya.Vyshkind, E.A.Dubinina, S.L.Sakovskaya, S.M.Fainshtein (Gorki Polytech. Inst., Gorki, USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.7, p.554-9 (July 1982).
Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.7, p.773-8 (July 1982).
[received: Sept. 1983]
The explosive instability of longitudinal waves in a beam-plasma system is examined. It is found that under certain conditions in the system indicated, stochastic stabilization of the 'explosion' is possible, and in this case complex attracting regions with random characteristics are formed in phase space. Estimates for laboratory plasma are presented. (13 refs.)

118725 Parametric and combination wave plasma processes in the low-hybrid electron frequency region excited by high-frequency electric pumping field. II. S.A.Aliev, G.S.Kirichenko.
Ukr. Fiz. Zh. (USSR), vol.28, no.9, p.1354-61 (Sept. 1983). In Russian.
For pt.I see ibid., vol.28, p.1173 (1983). Combination wave plasma processes in the oblique Langmuir oscillation region were investigated experimentally. Primary waves were excited parametrically by HF pumping and by an electron beam independently. Chaotic ionic frequency phase breakings of nonlinear HF oscillations were found. (14 refs.)

118726 Soliton generation in inhomogeneous plasma by a running wave field. V.A.Brazhnik, V.I.Grishaev, V.V.Demchenko, Yu.A.Zhdanov, P.I.Kravtsov.
Ukr. Fiz. Zh. (USSR), vol.28, no.9, p.1361-4 (Sept. 1983). In Russian.
The process of nonlinear saturation of absolute parametric instabilities excited in an inhomogeneous plasma by a running wave field was investigated in hydrodynamic approximation. The numerical analysis showed that the mechanism in the instability saturation was universal both in a strong wave coupling regime and in a weak one. It is of strong turbulent nature based on the soliton generation process under the action of the unstable wave electric field ponderomotive force. (1 ref.)

118727 Drift wave transport and origin of the disruption phenomenon - A theoretical model. G.Hasselberg, A.Rogister.
Report JUL-1830, Kernforschungsanlage, Julich, Germany (Feb. 1983), 48 pp.
Nonlinear ion Landau damping of drift waves yields a splitting of the spectrum into a long and a short wavelength branch. The latter contributes most (>90%) of the transport and permits to explain the observed relaxation of Tokamak plasma profiles to a weakly unstable state, in the occurrence with regard to the dissipative trapped electron mode. The fluxes indeed increase much more rapidly than the linear growth rates. This result and surprising coincidences between the linear theory and empirical laws concerning the high density limit lead the authors to propose that the slow rise of the sawtooth pulsations of the core occurs whilst the transport in the surrounding layer is insufficient to evacuate the power deposited. The sudden relaxation takes place once the released heat pulses are capable—much as in collisionless shock waves—of exciting the trapped electron mode to a sufficient level to ensure adequate transport. (57 refs.)

52.40D Electromagnetic wave propagation in plasma

118729 Electromagnetic wave propagation at high frequency in a plasma LMG [waveguide]. M.A.G.Calderon, J.L.Garcia, A.Vegas (Facultad de Ciencias, Santander, Spain).
An. Fis. Ser. B (Spain), vol.79, no.2, p.90-7 (May-Aug. 1983). In Spanish.
[received: Oct. 1983]
This paper deals with the theoretical study of EM waves propagation in a plasma LMG. (14 refs.)

118730 Second-harmonic emission from laser-plasma interactions. Xu Zhizhan, Xu Yuguang, Yin Guangyu, Zhang Yanzhen, Yu Jiajin, P.H.Y.Lee (Shanghai Inst. of Optics & Fine Mech., Acad. Sinica, Shanghai, China).
J. Appl. Phys. (USA), vol.54, no.9, p.4902-8 (Sept. 1983).
The authors have systematically investigated the second-harmonic (2ω) emission spectrum from 1.06-μm laser-plasma interactions. Experimental data on the dependence of 2ω spectrum, especially its broadness and complexity, on laser irradiation intensity, incidence angle, and prepulse are presented. A theoretical model using linear mode conversion and parametric decay instability processes can qualitatively explain the experimental results. (13 refs.)

118732 Wall material and wall temperature effects on negative ion production in a hydrogen plasma. W.G.Graham (Phys. Dept., New Univ. of Ulster, Coleraine, N Ireland).
J. Phys. D (GB), vol.16, no.10, p.1907-15 (14 Oct. 1983).
The effect of wall material and wall temperature on negative ion production in a hydrogen plasma has been studied. Under the same plasma conditions, within the combined uncertainties of the measurements, the same negative ion densities were found for Pyrex, stainless steel, copper and molybdenum. However, there seems to be a trend for stainless steel walls to produce somewhat higher negative ion densities. Contamination of the walls with hydrocarbons was found to reduce the negative ion density. It was also found that cooling the Pyrex walls leads to an increase in the negative ion density. (10 refs.)

118733 The one component plasma near a hard wall—weak coupling limit with image forces. A.Alastuey (Lab. de Phys. Theorique et Hautes Energies, Univ. de Paris-Sud, Orsay, France).
Mol. Phys. (GB), vol.50, no.1, p.33-48 (Sept. 1983).
The author computes the one and two body distribution functions of both two and three dimensional one component plasmas near a flat dielectric hard wall, in the weak coupling limit. In two dimensions, he uses a well known scheme in which all the electrostatic forces are treated perturbatively. In three dimensions, the image forces can no longer be treated perturbatively and the author derives a new formalism appropriate to this case. (16 refs.)

118734 Interaction of waves and boundary surface moving in collisionless plasma. A.D.Kanareikin, V.N.Krasil'nikov (Leningrad State Univ., Leningrad, USSR).
Radiophys. & Quantum Electron. (USA), vol.25, no.7, p.523-8 (July 1982). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.25, no.7, p.739-44 (July 1982). [received: Sept. 1983]
Reflection of plane waves by a reticular mirror in a collisionless plasma is analyzed, the motion of this mirror being described by a single function so that supergroup velocities can be considered and the trend of changes in the frequency of the reflected field can be explained. An expression is derived for the dispersive diffusion of wavefronts within the transition region. (4 refs.)

118735 On hydrogen recycling and gas desorption in a glow discharge. S.F.Grishin, V.Ya.Chernyshenko, V.B.Yuferov.
Ukr. Fiz. Zh. (USSR), vol.28, no.9, p.1365-70 (Sept. 1983). In Russian.
Deals with glow discharge cleaning of a stainless steel vacuum chamber. The irradiation dose increased, the time for a 100% hydrogen recycling decreases and the efficient factor of hydrogen implantation rises. With $D>3\times10^{18}$ ion/cm^2, the discharge is sustained practically in pure hydrogen. (6 refs.)

52.50 PLASMA PRODUCTION AND HEATING

118736 Stationary mode of expansion of a vapor heated by radiation or a fast-particle flux. A.V.Dobkin, T.B.Malyavina, I.V.Nemchinov.
J. Appl. Mech. & Tech. Phys. (USA), vol.23, no.6, p.743-50 (Nov.-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR)*, vol.23, no.6, p.14-22 (Nov.-Dec. 1982). [received: Sept. 1983]
High-power radiation or fast-particle flux will evaporate the surface of an obstacle and will heat the vapor to high temperatures, the vapor then expanding with high velocity. The authors examine the stationary corona for the case where the bombardment is by ions or radiation fluxes and the energy transfer near a sphere occurs under conditions close to those of radiative thermal conduction. 52.50J Plasma production and heating by laser beams

118737 The laser irradiated gas jet: A spectroscopic experimental and theoretical study. R.W.Lee, D.L.Matthews, L.Koppel (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA), G.E.Busch, G.Charatis, M.J.Dunning, F.J.Mayer.
J. Appl. Phys. (USA), vol.54, no.9, p.4909-15 (Sept. 1983).
The authors present X-ray spectroscopic measurements of the longitudinal electron density profile and the longitudinal and transverse electron temperature profiles for a laser irradiated gas jet. They attempt to verify their spectroscopic method by laser interferometry and by comparison of inferred quantities to those determined from laser plasma interaction simulations. Because temperature profiles were time dependent, they used a theoretical time dependent radiation transport code to analyze the data. (9 refs.)

118738 Enhanced spatial and spectral resolution in laser plasma spectroscopy using band-shaped implants on plane targets. J.-C.Gauthier, J.-P.Geindre, K.Najmabadi (Univ. Paris-XI, Orsay, France), C.Popovics, A.Poquerusse, M.Weinfeld.
J. Phys. D (GB), vol.16, no.10, p.1929-41 (14 Oct. 1983).
Band-shaped aluminium implants on plane carbon targets were irradiated at $0.1\text{-}2\times10^{15}$ W cm^{-2} by 600 ps laser pulses of 0.527 μm wavelength. The resulting blow-off plasmas were diagnosed by X-ray spectroscopy using entrance slits of various dimensions, orientations and positions with respect to the target plane. The authors studied the longitudinal and radial variations of line intensities and Stark widths of He-like and H-like Rydberg series. The effect of time integration was also qualitatively studied by varying implant thickness. Results showed a tenfold decrease of instrumental broadening due to the small lateral expansion of the plasma eliminating radial spatial deconvolution and minimising opacity effects. Comparison with computer modelling showed that $n\geq4$ Al^{12+} Lyman series emissions peaked in a 20 μm width region close to the target and that electron densities deduced from Stark broadening agree well with the simulations. (17 refs.)

118739 Ionization and expansion of a multiply charged laser plasma. A.v.Vinogradov, V.N.Shlyaptsev (P.N. Lebedev Phys. Inst., Acad. of Sci., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.298-302 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.509-16 (March 1983). [received: Oct. 1983]
An analysis is made of the hydrodynamics and ionization of matter in the process of interaction of laser radiation with targets made of heavy elements. An approximate method is developed to allow for the effects of ionization and a study is made of the influence of ionization on the hydrodynamic parameters of a plasma. Distributions of the electron density and temperature, and of the charge composition of a laser plasma are obtained. (30 refs.)

118740 Interaction of a laser pulse with a target. I. Photoelectron mechanism of generation of a spontaneous magnetic field. O.B.Anan'in, Yu.A.Bykovskii, B.V.Zamyshlyaev, I.K.Novikov, E.L.Stupitskii (Engng. Phys. Inst., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.307-14 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.523-34 (March 1983). [received: Oct. 1983]
An experimental and theoretical study is reported of a spontaneous magnetic field which appears as a result of interaction of laser radiation with a target. The attention is concentrated on the early component of the field which appears simultaneously with the laser pulse and persists until a laser plasma arrives at the point of measurement. A theoretical analysis is made of the mechanism of the appearance of this early component of a spontaneous magnetic field because of the formation of a current system in which the source is in the form of fast photoelectrons generated by photoionization of the background media by the radiation emitted from a laser plasma. This theoretical model is used to calculate the intensity of a spontaneous magnetic field in a wide range of pressures of the background medium and laser radiation powers. The experimental results obtained using an external magnetic field indicate the existence of an internal source of the current responsible for the appearance of the early component of a spontaneous magnetic field and confirm the proposed theoretical model. (55 refs.)

118741 Interaction of a laser pulse with a target. II. Photoionization of the ambient medium. E.L.Stupitskii (Engng. Phys. Inst., Moscow, USSR).
Sov. J. Quantum Electron. (USA), vol.13, no.3, p.315-18 (March 1983). Translation of: *Kvantovaya Elektron., Moskva (USSR)*, vol.10, no.3, p.534-40 (March 1983). [received: Oct. 1983]
For pt.I see ibid., vol.13, no.3, p.307-14 (1983). An investigation is made of the ionization of air by X-rays emitted from a high-temperature region of the interaction between a laser pulse and a target. The role of the various ionization mechanisms is determined and it is found that at a distance of several centimeters from the target the degree of ionization of air reaches its maximum value when the pressure in the chamber is $\sim$0.1 Torr and the laser radiation intensity is $\sim10^{13}$ W/cm^2. (10 refs.)

118742 Laser driven shock wave studies in single and double-layered slab targets. S.Eliezer, L.Gitter, A.D.Krumbein, D.Salzmann.
Report IA-1378, Israel Atomic Energy Comm., Tel Aviv (Jan. 1983), 46 pp.
Laser Driven Shock Wave Studies in Single and Double-layered Slab Targets. Simulations of laser-driven shock waves were carried out by means of a 1-D Lagrangian hydrodynamic code for pure and layered polyethylene and aluminum slab targets. Scaling laws were obtained for the pressure and temperature which are in good agreement with those found in the literature. High compressions were found to occur at the interface of CH_2 on Al targets but not when the layers were reversed. Long persistence times, relative to the plasma characteristic times, were found for this high pressure and the pressure could be optimized by adjusting the CH_2 layer thickness. (28 refs.)

52.55 PLASMA EQUILIBRIUM AND CONFINEMENT

118743 Measurement of the recombination rate coefficient of a tokamak vacuum vessel wall. H.Howe, R.Langley (Fusion Energy Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1435-40 (1983).
The recombination rate coefficient of the ISX-B vacuum vessel wall has been measured by observing the rate of decrease of gas pressure in the vessel during a glow discharge. A simple analytic expression which relates the rate of change of the pressure to the recombination rate is derived and verified by comparison with a complete numerical simulation. Comparison of the recombination coefficient measured in ISX-B with previous laboratory measure-

ments shows that the measured value is typical for a stainless steel surface covered with an oxide layer. (17 refs.)

118744 Equilibria of field-reversed configuration with subsidiary coils. M.Kako, T.Ishimura (Plasma Phys. Lab., Osaka Univ., Suita, Osaka, Japan), T.Amano.
J. Phys. Soc. Jpn. (Japan), vol.52, no.9, p.3056-65 (Sept. 1983).
Two-dimensional equilibria of a field-reversed configuration with subsidiary coils are computed by integrating the ideal magnetohydrodynamic equilibrium equation. The mirror coils have an effect to compress the plasma appreciably in the axial direction and hence sustain the compact torus. The cusp coils enlarge the plasma and consequently make the gradient of plasma density relaxed in the radial direction. (13 refs.)

118745 A model magnetic field for the calculation of particle-drift motions in a toroidal stellarator. W.N.G.Hitchon, K.D.McLenithan, H.E.Mynick (Torsatron/Stellarator Lab., Dept. of Electrical & Computer Engng., Univ. of Wisconsin, Madison, WI, USA).
Nucl. Fusion (Austria), vol.23, no.9, p.1143-52 (Sept. 1983).
A model for the magnetic field strength along a stellarator field line has been developed which correctly describes the principal contributions to the field strength and which can differ substantially from the simple form commonly assumed. An analytically tractable form of the model is obtained and is compared with results from ray-tracing in real fields. A theoretical description of the drift motions of 'localized' particles (trapped in the helical ripples on the magnetic field) is then obtained for a more general class of stellarator field than previously possible. Orbits in real devices are considered for both $l=2$ and $l=3$, and differences between the predictions of the present work and of earlier investigations are pointed out. The application of the theory to particle guiding-centre orbit following is discussed, and other consequences of the improved model field are indicated. (12 refs.)

118746 The engineering of magnetic fusion reactors. R.W.Conn.
Sci. Am. (USA), vol.249, no.4, p.44-55 (Oct. 1983).
Design projects under way and experimental reactors now being built will test the practicality of schemes for generating power from the thermonuclear fusion of ions trapped by magnetic fields. (no refs.)

118747 Dissipative effects on stable RFP configuration. N.Nakajima, Y.Nomura, H.Momota.
Report IPPJ-631, Nagoya Univ., Japan (April 1983), 30 pp.
Evolutions of RFP equilibria due to dissipative effects are studied theoretically. It is shown that the existence of stable RFP equilibria satisfying ideal and nonideal MHD stability criteria requires adequate hollow temperature profiles. If no profile control is applied to these RFP equilibria, the sufficient condition of stability for $m=1$ modes is first violated due to the disappearance of the toroidal current reversal near the surface within a short time. 52.65 PLASMA SIMULATION

118748 Implicit moment PIC-hybrid simulation of collisional plasma. R.J.Mason (Los Alamos Nat. Lab., Los Alamos, NM, USA).
J. Comput. Phys. (USA), vol.51, no.3, p.484-501 (Sept. 1983).
A self-consistent scheme was developed to model electron transport in evolving plasmas of arbitrary classical collisionality. The electrons and ions are treated as either multiple Eulerian fluids or collisional particles-in-cell. Particle suprathermal electrons scatter off ions, and drag against fluid background thermal electrons. The background electrons undergo ion friction, thermal coupling, and bremsstrahlung. The components accelerate in electric fields obtained by the implicit moment method, which permits $\Delta t \gg \omega_p^{-1}$ and $\Delta x \gg \lambda_D$—allowing the treatment of problems 10^2-10^3 times more complex than those accessible with older explicit methods. The fluid description for the background plasma components permits the modeling of transport in systems spanning more than a 10^7-fold change in density, and encompassing contiguous collisional and collisionless regions. Results are presented from application of the scheme to the modeling of CO_2 laser-generated suprathermal electron transport in expanding thin foils, and in multi-foil target configurations. 52.70 PLASMA DIAGNOSTIC TECHNIQUES AND INSTRUMENTATION

118749 Mass spectra and ionization temperatures in an argon-nitrogen inductively coupled plasma. R.S.Houk, A.Montaser, V.A.Fassel (Ames Lab., Iowa State Univ., Ames, IA, USA).
Appl. Spectrosc. (USA), vol.37, no.5, p.425-8 (Sept.-Oct. 1983).
Positive ions were extracted from the axial channel of an inductively coupled plasma (ICP) in which the outer gas flow was Ar, N_2, or a mixture of Ar and N_2. Addition of N_2 to the outer gas decreases the electron number density (n_e) in the axial channel. Ar^{+2}, O_2^+, and ArH^+ react with N-containing species in the plasma and/or during the ion extraction process. Ar^+ remains abundant even if there is no Ar in the outer gas, which indicates the probable occurrence of charge transfer reactions between N_2^+ and Ar. The present work corroborates two general concepts upon which several theories of the origin of suprathermal ionization in ICPs are based: (a) species are physically transported from the induction region to the axial channel; and (b) these species may react with and ionize neutral species in the axial channel. Ionization temperatures (T_{ion}) measured from the ratio Cd^+/I^+ were 5750 to 6700K for a N_2 outer flow ICP at a forward power of 1.2 kW. This T_{ion} range is significantly below that obtained for an Ar outer gas ICP under otherwise similar operating parameters. (39 refs.)

118750 Nonlinear plasma spectroscopy of the hydrogen Balmer-α line. E.W.Weber, R.Frankenberger, M.Schilling (Phys. Inst., Univ. Heidelberg, Heidelberg, Germany).
Appl. Phys. B (Germany), vol.B32, no.2, p.63-73 (Oct. 1983).
The plasma line broadening of H_α fine-structure lines is investigated with Doppler-free saturation and polarization spectroscopy in He-H gas and arc discharges at plasma densities of 10^8 cm^{-3} $<N\lesssim 1.4\times10^{14}$ cm^{-3}. With a single-mode laser, the shift and broadening of four resolved $H_\alpha$fs lines are measured in a low pressure discharge for $N<10^{11}$ cm^{-3}. With an intense, broadband multi-mode laser the plasma effects of H_α are investigated up to $N=1.4\times10^{14}$ cm^{-3} in a hollow cathode arc. Calculations in the classical phase shift and impact approximations can explain the experimental data and peculiarities of the low-density plasma effects and show that the ions are the dominant perturbers. Ion dynamical effects, perturber mass and temperature dependence are observed and interpreted. Applications of the nonlinear techniques to other H and D lines, other atoms, and for H and D plasma diagnostics are discussed. (23 refs.)

118751 Coding aperture applied to X-ray imaging of laser-plasmas. N.Fleurot, J.P.Gex, R.Sauneuf (CEA/CEL, Villeneuve-Saint-Georges, France), N.de Beaucoudray.
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.312, p.182-7 (1983). In French. (1st European Conference on Cineradiography with Photons or Particles, Paris, France, 18-21 May 1981).
The investigation of phenomena occurring in micro-plasmas created by laser is mainly based on images obtained from emitted X-rays or α-particles. To obtain images, the pinhole camera is widely used but the collection efficiency of radiation or particles as also the signal-to-noise ratio (S/N ratio) decrease as the spatial resolution is increased. To improve the S/N ratio one can use a coding-aperture imaging device, the collecting surface of which is much larger than the pinhole one. The authors have chosen a simple coding-aperture made of a circular slit cut in a thin foil which is opaque at the radiation considered. The slit width is $\delta=6$ μm; the mean radius is $R=1$ mm. The image reconstruction is obtained by numerical processing (Fourier transform and filtering). The transverse spatial resolution δ_t in the object is $\delta_t \simeq \delta$ but can be improved by a factor of 2 or 3 if the edges of the circular slit are sharp. The axial spatial resolution (tomographic effect) δ_l is $\delta_l \simeq \delta_t l_1/R$, with l_1 the code-to-object distance. (9 refs.)

118752 Application of Thomson scattering to the diagnosis of plasma temperatures within the Joint European Torus using 10.6 μm radiation. D.A.Reynolds, I.J.Spalding, T.Stamatakis, A.C.Walker (Culham Lab., UKAEA, Abingdon, England).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.369, p.616-21 (1983). [received: Sept. 1983] (SPIE Proceedings of the Max Born Centenary Conference OPTICS 82, ECOSA 82, Edinburgh, Scotland, 7-10 Sept. 1982).
On completion, the Joint European Torus (JET) will be the largest nuclear fusion experiment constructed. The authors are currently developing a novel system to measure radial electron temperature/density profiles and central ion temperatures within the plasma using 10 Hz rep-rate CO_2 laser. The large dimensions and expected neutron fluxes represent significant constraints on this design. Specifically the input and collected scattered radiation have to be relayed between shielded lasers/detectors and the torus, ~30 m away, and the alignment maintained remotely. This system, containing ~75 mirrors and designed with the aid of a computer ray-tracing program, is described together with some details of the spectrometer and laser. (4 refs.)

118753 Observation of effects of inhomogeneous magnetic field on resonance cone fields. T.Ohnuma (Dept. of Electrical Engng., Tohoku Univ., Sendai, Japan).
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.7, p.1226 (July 1983).
In an inhomogeneous (converging) magnetic field in a plasma, resonance cone fields are experimentally found to spread with respect to the curved magnetic field line which passes through the source. (4 refs.)

118754 A system for in situ studies of plasma-surface interactions using X-ray photoelectron spectroscopy. J.L.Vossen, J.H.Thomas,III., J.-S.Maa, O.R.Mesker, G.O.Fowler (RCA Labs., Princeton, NJ, USA).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1452-5 (1983).
A system is described in which plasma/surface treatments can be performed and the substrates can be analyzed by X-ray photoelectron spectroscopy by transferring them via a load lock into the analytic chamber. Also described are some plasma etching experiments that demonstrate the utility of this apparatus. The system emulates larger systems in which plasma treatments are performed at pressures, voltages, and power densities similar to those employed in large commercial systems. (20 refs.)

118755 Spectroscopic measurement of hydrogen contamination in weld arc plasmas. J.E.Shea, C.S.Gardner (Dept. of Electrical Engng., Univ. of Illinois, Urbana, IL, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.4928-38 (Sept. 1983).
The introduction of hydrogen into metals during welding is known to cause hydrogen assisted cracking and embrittlement in certain situations. It has been shown that the weld metal hydrogen content is directly related to hydrogen concentration in the weld arc plasma. In this paper the authors describe a simple spectroscopic technique for measuring the arc plasma hydrogen concentration in real time when an argon shield gas is used. This technique is based on the fact that the intensity ratio of the hydrogen Balmer Alpha emission line at 6563 Å and an argon emission line at 6965 Å was observed to be an approximately linear function of hydrogen concentration in the weld arc plasma. This technique was experimentally verified under a

variety of welding conditions for gas metal arc welding and found to have an error of less than 10% when measuring hydrogen concentrations in the arc plasma as low as 0.25% by volume. This method of hydrogen measurement is also applicable when welding with shield gases not containing argon so long as a suitable ratioing line is available. (12 refs.)

118756 Measurement of total decay rates of excited states in a deuterium plasma by laser-resonance fluorescence. G.Himmel, L.Sowa (Inst. fur Experimentalphys. II, Ruhr-Univ. Bochum, Bochum, Germany).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.30, no.4, p.357-64 (Oct. 1983).
In a deuterium plasma with an electron density of 2.8×10^{13} cm^{-3} and an electron temperature of 1850K, the $n=2$ level is coupled to the $n=6$ level by absorption of short-pulsed laser light. Due to inelastic and superelastic electron collisions, the enhanced $n=6$ population density is distributed to its neighbouring levels, i.e. $n=5$ and $n=7$. The laser-resonance fluorescences of the Balmer lines D_5, D_6, and D_7 were measured with time resolution. The transient behaviour of the fluorescence is compared with numerical calculations, which are based on the rate equations for population densities of a system with 5 states. It is observed that the rate coefficients of Johnson (1972) cannot explain the authors experimental data. The coefficients of Vriens and Smeets (1980) compare favourably with the measurements within experimental errors. (11 refs.)

118757 A new reimaging technique for measurement of the radial density distribution of metastable states. M.R.Teixeira, F.C.Rodrigues (Servico de Optica e Fisica dos Plasmas, LNETI, Sacavem, Portugal).
J. Quant. Spectrosc. & Radiat. Transfer (GB), vol.30, no.4, p.365-9 (Oct. 1983).
Measurements of absorption and calculations of the radial density distribution of metastable states require the use of an external light source. The authors describe a simple reimaging technique. The theory of the method and its application to the determination of the radial density distribution of metastable states in a hollow cathode are presented. The method requires uniformity along the axis of the discharge, symmetrical reimaging, and knowledge of absorption at the boundary of the plasma. (5 refs.)

118758 A rapid-frequency-scan laser for measurement of velocity distribution of impurities in plasmas by fluorescence spectroscopy. C.Honda (Faculty of Engng., Kyushu Univ., Fukuoka, Japan), K.Nishimura, M.Maeda, K.Muraoka, M.Akazaki.
J. Phys. D (GB), vol.16, no.10, p.1943-52 (14 Oct. 1983).
Laser fluorescence spectroscopy is a useful technique to determine the density and the flux of metallic atom impurities in the edge region of Tokamaks. A new scheme to measure the Doppler profile of impurity atoms by a single laser shot is proposed. The frequency of dye-laser emission is rapidly scanned across the Doppler profile during the laser action in the order of microseconds. A flashlamp-pumped dye laser is tuned by a piezoelectrically scanned etalon, and a scanning range of 60 pm is obtained with a resolution of 3 pm at $\lambda\simeq600$ nm. Fluorescence line profiles of Na atoms are determined with a resolution of less than 1 pm. Several problems of Tokamak measurements are briefly discussed. (18 refs.)

118759 Gain and loss kinetics in a pulsed discharge by scanning in time with a probing laser pulse. V.V.Gruzinskii, V.A.Suchkov.
J. Appl. Spectrosc. (USA), vol.38, no.1, p.102-6 (Jan. 1983). Translation of: *Zh. Prikl. Spektrosk. (USSR),* vol.38, no.1, p.120-6 (Jan. 1983). (13 refs.)

118760 High temperature plasma diagnostics by beam probe spectroscopy. K.Kadota, J.Fujita (Inst. of Plasma Phys., Nagoya Univ., Chikusa-ku, Nagoya, Japan).
J. Spectrosc. Soc. Jpn. (Japan), vol.32, no.4, p.223-40 (1983). In Japanese. (85 refs.)

118761 Whistler-mode electron cyclotron emission as an electron temperature diagnostic for magnetic mirror devices. G.D.Tsakiris, R.F.Ellis (Lab. for Plasma & Fusion Energy Studies, Univ. of Maryland, College Park, MD, USA).
Nucl. Fusion (Austria), vol.23, no.9, p.1115-25 (Sept. 1983).
A non-relativistic formulation has been developed which calculates the whistler-mode electron cyclotron emission spectrum in the direction parallel to the magnetic field for a plasma containing an isotropic Maxwellian electron component and an anisotropic bi-Maxwellian electron component. The formulation is valid for arbitrary densities of both components and the model utilizes the radiation transfer equation to obtain the intensity of the emitted radiation. The calculations are intended for use with mirror devices and the motivation is to use cyclotron emission as an electron temperature diagnostic. The projected plasma parameters for the TMX-Upgrade machine have been considered as an example, where the plasma is assumed to have a cold- and a hot-electron temperature profile can be obtained from spectral measurements of the cyclotron emission. The effect of the hot-electron population has been considered in detail and it is shown that in certain circumstances their influence on the emitted spectrum is small. For those cases where hot electrons dominate the emission, the model can be used to obtain important information about hot-electron behaviour. (7 refs.)

118762 Measurement of ionization rates of Ti IX, Ne VI, Ne VII, and O VI. R.U.Datla, J.R.Roberts (NBS, Washington, DC, USA).
Phys. Rev. A (USA), vol.28, no.4, p.2201-8 (Oct. 1983).
The effective ionization rates of Ti IX, Ne VI, Ne VII, and O VI have been measured with the use of the plasma spectroscopy method in a θ pinch discharge at an electron temperature (50-60 eV) much below their ionization threshold and at an electron density of $(\simeq2\text{-}3)\times10^{16}$ cm^{-3}. A theoretical analysis of the effective ionization rates showed that excitation ionization is a major contributing process. Theoretical values are in reasonable agreement with experiment. (22 refs.)

118763 Optogalvanic double-resonance spectroscopy in a neon discharge. K.Miyazaki, H.Scheingraber, C.R.Vidal (Inst. fur Extraterrestrische Phys., Max-Planck-Inst. fur Phys. & Astrophys., Garching bei Munchen, Germany).
Phys. Rev. A (USA), vol.28, no.4, p.2229-44 (Oct. 1983).
A recently proposed method of optogalvanic double-resonance (OGDR) spectroscopy, which employs two CW lasers modulated at different frequencies and a DC discharge, has been investigated theoretically as well as experimentally. The technique is demonstrated to provide a versatile, state-selective spectroscopic method. A detailed analysis has been carried out for different situations where two lasers pump transitions which have the lower and/or upper state, or no state, in common. It also shows that the OGDR signal detected at the sum or difference modulation frequency can be given as a linear combination of the perturbed population densities in a plasma which give rise to the single-resonance signal. In addition, the results show that the OGDR signal polarity is characteristic for each type of double resonance. This has been verified in an OGDR experiment using a hollow-cathode discharge in neon and two CW dye lasers. State-selective OGDR spectra have been compared with optical-optical double-resonance spectra. Useful applications and advantages of the OGDR spectroscopy are discussed. (48 refs.)

118764 Measurement of electron concentrations by hydrogen line-broadening using a photodiode array spectrometer. R.R.Williams, G.N.Coleman (Dept. of Chem., Univ. of Georgia, Athens, GA, USA).
Spectrochim. Acta Part B (GB), vol.38B, no.8, p.1171-8 (1983).
A novel apparatus for measuring hydrogen line broadening in plasmas using a linear photodiode array spectrometer is described and applied to the measurement of spatially resolved electron concentrations in two- and three-electrode direct current plasmas. The sources and magnitude of the errors associated with those line width measurements are also discussed. (14 refs.)

118765 Investigation of electron spectra of chemi-ionization processes in the afterglow plasma. V.I.Demidov, N.B.Kolokolov, O.G.Toronov.
Vestn. Leningr. Univ. Fiz. & Khim. (USSR), no.3, p.87-91 (Aug. 1983). In Russian.
The relationship is considered between the velocity distribution function of fast electrons measured in the afterglow plasma and electron spectra of chemi-ionization processes. A method of determining spectra from electron velocity distribution functions measured by Langmuir probes is proposed. (6 refs.)

52.75 PLASMA DEVICES AND APPLICATIONS

(see also 28.52 Fusion reactors, 86.30L Electrogasdynamic and magnetohydrodynamic conversion; for ion sources, see 29.25 Particle sources and targets)

118766 Runaway electrons in the small shell-less Tokamak device NOVA-I. E.Nishimura (Energy Res. Lab., Hitachi Ltd., Hitachi-shi, Japan).
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.7, p.1182-7 (July 1983).
The mechanisms of the production and confinement of runaway electrons in the Tokamak device NOVA-I were studied by experimentally measuring the energies of these electrons examining how their behavior depended on the discharge parameters. Numerical calculations were also made on their drift orbits. From a comparison of the experimental and numerical analyses, it is concluded that: (1) neutral particles obstruct the production of runaway electrons during the breakdown phase of the discharge, while the densities of electrons having energies of the order of 10 eV build up; (2) electrons then begin to run away in the hot central region of the plasma, since the density of neutral particles decreases with ionization; (3) the orbits of the runaway electrons shift outward while spreading radially as the energy of the runaway electrons increases with time, until the orbits intersect the outer limiter or the torus wall. (12 refs.)

118767 Toroidal plasma device with a helical magnetic axis: Asperator NP-4. Y.Funato, I.Sakamoto, H.Watanabe (Dept. of Nuclear Engng., Tohoku Univ., Sendai, Japan).
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.7, p.1188-93 (July 1983).
A new magnetic trap with a three-dimensional magnetic axis is designed and constructed and the results together with the properties of the magnetic field configuration of the system are described. The field configuration of the device is characterized by a non-planar axis with a multi-field period of $n=8$ around the torus, an extremely high rotational transform angle of $\iota/2\pi=5.6$ and good helical symmetry. Engineering problems in the fabrication of the vacuum chamber and the magnetic coil system and the overall construction of the device are discussed. The magnetic field configuration measured by the electron beam method and a magnetic probe agrees well with the result of numerical calculation. (11 refs.)

118768 Study of the discharge cleaning process in JIPP T-II torus by residual gas analyzer. N.Noda, S.Hirokura, Y.Taniguchi, S.Tanahashi (Inst. of Plasma Phys., Nagoya Univ., Nagoya, Japan).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1430-4 (1983).
After several hours of discharge cleaning, it has been observed that the decay time of the water-vapor partial pressure changes from one well defined value to another. A long decay time observed in the later phase can be interpreted as a result of a slow deoxidation rate of chromium oxide, which may dominate the cleaning process in this phase. Optimization of the electron density for the cleaning is discussed, comparing the experimental results on density dependence of the water-vapor partial pressure with a result based on a zero-dimensional calculation for particle balance. One of the essential points for effective cleaning is found to be raising the electron density of the plasma high enough that the dissociation loss rate of H_2O is as large as the sticking loss rate. A density as high as 10^{11} cm^{-3} is required for a clean surface condition where sticking probability is presumed to be around 0.5. (16 refs.)

118769 The design study of high voltage plasma focus for a large fluence neutron source by using a water capacitor bank. I.Ueno (Dept. of Electrical Engng., Univ. of Tokyo, Tokyo, Japan), T.Kobata.
J. Fac. Eng. Univ. Tokyo Ser. B (Japan), vol.37, no.1, p.79-93 (March 1983). [received: Oct. 1983]
A new possibility for a high intensity neutron source (HINS) would be opened by the plasma focus device if one has a high voltage capacitor bank. A scaling law of neutron yield for D-T gas discharge in a plasma focus device is obtained after Imshennik, Filippov and Filippova (1973). The resulting scaling law shows the realizability of the D-T HINS by the use of a plasma focus, provided that the device is operated under a high voltage condition. Until now, it has been difficult to construct a high voltage capacitor bank of long life, for example with $V_0=300$ kV, $C_0=200$ μF and $L_0\sim5$ nH necessary in the level of HINS. It becomes possible to design this capacitor bank by using the coaxial water capacitor which has been developed for the electron

and ion beam accelerator. The size of a capacitor designed for $V_0=300$ kV, $C_0=1$ μF is $\phi 5$ m$\times$22 m. Two hundred capacitors are used in parallel in order to get the 200 μF. (11 refs.)

118770 Diagnostics of a plasma jet with grid electrodes. V.I.Batkin, V.N.Getmanov, O.Ya.Savchenko, R.A.Khusainov.
J. Appl. Mech. & Tech. Phys. (USA), vol.23, no.6, p.758-64 (Nov.-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR),* vol.23, no.6, p.30-6 (Nov.-Dec. 1982). [received: Sept. 1983]
The authors describe the diagnostics of a plasma jet ejected from the anode hole of a pulsed arc hydrogen plasma source. The beam diagnostics system used allows proton and atomic components of the beam to be analysed separately with a large transverse energy resolution. G.V. Roslyakov's (1981) assumption of the free streaming of protons in a plasma jet is confirmed. (11 refs.)

118771 Three-dimensional flow development in MHD generators at part load. E.D.Doss, R.K.Ahluwalia (Argonne Nat. Lab., Argonne, IL, USA).
J. Energy (USA), vol.7, no.4, p.289-90 (July-Aug. 1983).
The three-dimensional behavior of flow in magnetohydrodynamic (MHD) generators at design and off-design loading points is investigated. Faraday as well as diagonally connected channels with insulating or conducting sidewalls are considered. The role of MHD body forces in generating axial vorticity and hence secondary flows in the cross stream has been analyzed. For Faraday channels with strong MHD interaction, the generated vorticity is shown to direct the secondary flow from the cathode to the anode wall along the centerline. For diagonally connected channels near short circuit, the generated vorticity is shown to direct the secondary flow from the anode to the cathode wall along the centerline, and vice versa at near open-circuit conditions. (3 refs.)

118772 Magnetodrodynamic generator scaling analysis for baseload commercial powerplants. D.W.Swallom, C.C.P.Pian (Avco Everett Res. Lab., Everett, MA, USA).
J. Energy (USA), vol.7, no.4, p.338-44 (July-Aug. 1983).
Magnetohydrodynamic generator channel scaling analyses have been performed to establish the effect of generator size and oxygen enrichment on channel performance. These studies have shown that MHD generator channels can be designed to operate efficiently over the range of 250-2135 MW. The optimum design conditions for each of the thermal inputs were established by investigating various combinations of electrical load parameters, pressure ratios, magnetic field profiles, and channel lengths. From these parameter variations the set of conditions producing the optimum performance was selected for the design point. These results provide design flexibility for the baseload combined cycle MHD/steam powerplant. (17 refs.)

118773 Simulation of starting transients in the UTSI MHD generator. Y.F.Liao, M.Ishikawa, H.J.Schmidt, Y.C.L.Wu (Univ. of Tennessee Space Inst., Tullahoma, TN, USA).
J. Energy (USA), vol.7, no.4, p.374-81 (July-Aug. 1983).
A numerical procedure for solving the unsteady, two-dimensional, compressible Navier-Stokes equations has been extended for magnetohydrodynamic (MHD) flows by the inclusion of the appropriate Lorentz force and Joule heating terms in the governing equations. With appropriate initial and boundary conditions, the procedure can be used for the investigation of transient phenomena as well as the asymptotic steady-state characteristics of internal MHD flows. Results obtained for the simulation of starting processes in the UTSI coal-fired MHD flowtrain are presented and found to be in good agreement with experimental observations. (13 refs.)

52.80 ELECTRIC DISCHARGES

(see also 51.50 Electrical phenomena in gases)

118774 Sparkover time lag of gap having a protrusion in anode. N.Ikuta (Tokushima Univ., Tokushima, Japan), K.Kondo, K.Yoshida, Y.Ishiguro.
Trans. Inst. Electr. Eng. Jpn. Sect. E (Japan), vol.103, no.3-4, p.23-32 (March-April 1983).
Using a special gap providing a needle protrusion in the anode, values of time lag τ from the start of UV irradiation to sparkover under DC voltages are measured. The distribution of log τ for the applied voltage shows a slim and linear pattern over about 10% voltage range from the minimum value. The linear region in the log τ-V diagram moves consistently depending on the gas temperature, gas flow and other conditions not electrical. From these results, it is considered that the sparkover in this gap under a lower voltage is only accomplished by forming up the condition for the streamer initiation through the accumulation of metastable molecules in front of the needle tip. The build up of metastable molecule concentration due to the successive injection of avalanches can increase the ionization rate through the energy enhancement of electrons by collisions of the second kind and by cumulative processes. Then the formative characteristics are observed in the sparkover time lag in this gap. (12 refs.)

118775 Quantitative evaluation of the parameters and the deviation of an electric current in a magnetic field. J.Ramos Barrado, A.Monterde Garcia (Facultad de Ciencias, Univ. de Malaga, Malaga, Spain), G.Pardo Sanchez.
An. Fis. Ser. B (Spain), vol.79, no.2, p.101-4 (May-Aug. 1983). In Spanish. [received: Oct. 1983]
A factorial planification to obtain the influence of magnetic field, electric current intensity, pressure, and their interactions, on the deviation of a wall stabilized electric arc is used. Moreover, the authors have calculated an experimental expression to arc displacement in function of electric current density and magnetic field. (9 refs.)

118776 Acoustic impulse generation by electric discharges. L.Sanchez Pina, A.Moreno Arranz, J.Pfretzschner Sanchez (Inst. de Acustica, Consejo Superior de Investigaciones, Cientificas, Madrid, Spain).
An. Fis. Ser. B (Spain), vol.79, no.2, p.141-5 (May-Aug. 1983). In Spanish. [received: Oct. 1983]
This work deals with the generation of acoustic impulses by means of low voltage capacitor discharges across a specially designed graphite resistor and the resulting ionised surrounding fluid. A prototype for the production of detonations is described and the electric features of the process are analysed with regard to the magnitudes of the constitutive elements. The acoustic features are described by means of the peak value and the spectrum of the signal and correlated with the electric quantities. (11 refs.)

118777 Local dependence of rise time of spectral line intensities in Ne glow discharge tube. M.Yamashita (Faculty of Sci. & Technol., Sci. Univ. of Tokyo, Chiba, Japan).
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.7, p.1170-5 (July 1983).
The radial dependence of line intensities in an impulsive Ne glow discharge was investigated with particular attention being paid to the initial temporal changes of emissive line intensities. Two kinds of discharge tube, a cylindrical hollow cathode (CHC) tube and a plane disk cathode (PDC) tube, were used. The empirical formulae for the radial dependence of the temporal line intensities before reaching the stationary state are presented, with the experimental confirmation that the well-known simple Bessel function type formula is obtained in the CHC at low pressure in the stationary state. (19 refs.)

118778 Corona threshold voltage of negative DC surface discharge. N.Sugawara, K.Hokari (Dept. of Electrical Engng., Kitami Inst. of Technol., Kitami, Japan).
Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.7, p.1225 (July 1983).
The corona threshold voltage with a needle and an earthed electrode on the surface of an insulator (the corona threshold voltage of the surface) is presented. The corona threshold voltage of the surface is examined as a function of the gap length, and the influence of discharge on the insulator with and without an earthed conductor on one side (the conductor being a backing electrode) and the insulator materials on the surface corona threshold voltage are dealt with. The voltage between a needle and the blade of a razor electrode on an insulator without a backing electrode is divided by the surface resistance on the insulator. The voltages between electrodes in surface discharge on an insulator with a backing electrode are almost equal to the voltage between the needle and the backing electrode divided by the volume resistance according to the thickness of the insulator, because the thickness of the insulator is less than the shortest gap length in this study. (5 refs.)

118779 Electrical discharge channel in sodium vapor initiated by resonant laser light. H.Tamura, J.Mogi, K.Horioka, K.Kasuya (Dept. of Energy Sci., Tokyo Inst. of Technol., Yokohama, Japan).
Jpn. J. Appl. Phys. Part 2 (Japan), vol.22, no.7, p.L417-19 (July 1983).
A z-discharge channel in sodium vapor was initiated by a laser beam, which was tuned to the sodium D resonance line ($\lambda=589$ nm). Applying a voltage sufficiently lower than the self-breakdown voltage, the discharge of $\sim$40 cm in length was initiated by laser radiation of modest power density. Streak-camera photographs showed that the laser-initiated discharge channel was produced just along the laser beam path. It was confirmed that the resonant laser light was very effective for the channel initiation. (12 refs.)

118780 Magnetically confined low-pressure gas discharge generated in a vacuum switch. K.Kageyama (Res. & Dev. Center, Toshiba Corp., Kawasaki, Japan).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1522-8 (1983).
Mode and current paths for a discharge in a vacuum switch placed in a magnetic field were investigated experimentally and analytically to find a possible method for measuring the pressure in the switch. A low-pressure gas discharge is generated in the switch, and discharge properties show evidence that the arc shield, which is electrically floating, is an essential element. Simulators of the vacuum switch were assembled to determine the effects of the shield on the discharge. Pressure dependence and current distributions in various electric-field configurations in the simulators were measured and analyzed. The discharge in the vacuum switch is identified as a series discharge of an inverted magnetron and of a magnetron through the shield as a common electrode. The mode for each elemental discharge is the same as that employed by cold-cathode vacuum gauges. In the inverted magnetron, the current flows from the switch-contact periphery at positive high voltage radially to the shield. In the magnetron, it flows from the shield end radially to the rod of a switch electrode, which is electrically grounded. (4 refs.)

118781 Properties of a series crossed-field discharge in a vacuum switch. K.Kageyama (Res. & Dev. Center, Toshiba Corp., Kawasaki, Japan).
J. Vac. Sci. & Technol. A (USA), vol.1, no.3, p.1529-32 (1983).
Properties of low pressure gas discharges generated in a vacuum switch placed in a magnetic field were investigated for an approach to a method of measuring pressure. The discharge was identified in a previous paper as a series crossed-field discharge of an inverted magnetron and of a magnetron. The present experiments reveal discharge-current dependences on pressures, discharge voltages and magnetic-field strengths. These dependences agree well with those deduced from properties of the two elemental discharges that are applicable to pressure measurement. Discharges were generated in various gas species, and discharge-current dependence on gas species was obtained. The series crossed-field discharge was proved to be self-sustaining, and an estimate supports the discharge stability. (3 refs.)

118782 Optical and spectroscopic investigations of a pulsed near-surface discharge at atmospheric pressure. V.B.Avramenko, A.M.Kuz'mitskii, L.Ya.Min'ko (Inst. of Phys., Acad. of Sci., Belorussia SSR).
High Temp. (USA), vol.20, no.6, p.827-31 (Nov.-Dec. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR),* vol.20, no.6, p.1052-6 (Nov.-Dec. 1982). [received: Sept. 1983]
The results of experimental optical and spectroscopic investigations of a pulsed near-surface discharge at atmospheric pressure are given. The course of development and the spectroscopic properties of the near-surface plasma structures are investigated. The distributions of temperature and charged-particle concentration in space and time are obtained. Near-surface and surface discharges are briefly compared. (9 refs.)

118783 Analysis of radial distribution of plasma parameters in a coaxial-line microwave discharge tube. I.Kato, S.Hara, S.Wakana (Dept. of Electronics & Communication Engng., Waseda Univ., Tokyo, Japan).
J. Appl. Phys. (USA), vol.54, no.9, p.4883-8 (Sept. 1983).
The discharge mechanism in a coaxial-line microwave discharge tube that makes uniform plasma along the circumference of the tube has been analyzed. The analysis includes the skin effect of microwave penetration into the plasma and the equilibrium between generation and losses of the charge particles. It is shown that the radial distributions of electron density and electron temperature can be calculated from measured values of the radial distribution of light intensity. The electron density is about 10^{12} cm^{-3} near the center axis of the plasma column and is close to trapezoidal in shape. The electron temperature is about 4×10^4K near the tube wall and decreases monotonically toward the center of the plasma column. (18 refs.)

118784 Measurements of energetic electrons in a magnetized hot filament discharge. R.F.Ellis, D.N.Arion (Lab. for Plasma & Fusion Energy Studies, Univ. of Maryland, College Park, MD, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.4895-901 (Sept. 1983).
Measurements of the energy distribution function of primary electrons in a hot filament discharge in a magnetic field have been made. These results show a smooth distribution function which decreases monotonically with increasing energy up to a value approximately equal to the discharge voltage; the shape of the distribution is independent of other discharge parameters. An ionization kinetics model is used to estimate the energetic electron density, which is shown to vary linearly with plasma density, inversely with fill pressure, and decrease with increasing discharge voltage. At the highest plasma densities bulk heating, possibly due to coulomb drag on primary electrons, is observed. (12 refs.)

118785 Use of electric probes in silane radio frequency discharges. E.R.Mosburg,Jr., R.C.Kerns, J.R.Abelson (Solar Energy Res. Inst., Golden, CO, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.4916-27 (Sept. 1983).
The use of electrostatic probe techniques for measurement of the electron temperature kT_e and the electron density n_e in pure and BF_3 doped silane radio frequency (13.56 MHz) discharges is demonstrated to be feasible even though amorphous silicon is being deposited on the probe surfaces. The required conductivity of such deposited silicon surface layers is examined and compared with the measured photoconductivity and thermally induced conductivity of amorphous silicon. An equation is derived for the double probe current-voltage (*I-V*) curve which includes the first order effect of AC fields and can be used to determine the electron density. During typical depositions of thin films of amorphous silicon from such discharges, values of $kT_e=2\text{-}2.5$ eV and $n_e=(1\text{-}1.5)\times10^9$ cm^{-3} were obtained. These values are consistent with those obtained by other workers using microwave and optical techniques. In BF_3 doped silane an abrupt step is observed in the Langmuir *I-V* curves which indicates the presence of a group of fast, anisotropic electrons. In diborane doped silane, probe measurements become unstable and irreproducible. For this reason the authors investigate a RF probe technique. The advantages and constraints inherent in using this method in their RF discharges are examined and analyzed. (36 refs.)

118786 Particle densities in high current hollow cathode discharges. H.Koch, H.J.Eichler (Optisches Inst., Tech. Univ. Berlin, Berlin, Germany).
J. Appl. Phys. (USA), vol.54, no.9, p.4939-46 (Sept. 1983).
Operating hollow cathode discharges at current densities in excess of 0.1 A/cm^2 leads to an efficient production of metal vapor via the process of cathode sputtering. This method of metal vapor production has been exploited in numerous metal ion laser devices and in spectroscopic light sources. In this paper the main processes involved in high current hollow cathode discharges will be discussed for the special case of a Ne-Cu discharge that can be regarded as representative for other sputtering hollow cathode discharges. Starting from a set of balance equations, expressions for the current density dependence of the spatially averaged buffer gas ion-, metal ion-, and metal atom-density are derived. These expressions are verified experimentally by measurements of the spontaneous emission of a Cu II line and yield in a simple manner realistic data of these particle densities. Finally the obtained results are related to the characteristics of a Cu II laser. (28 refs.)

118787 Generalized theory of first Townsend ionization coefficient in strong electric fields. L.Friedland, J.M.Kagan (Racah Inst. of Phys., Hebrew Univ. of Jerusalem, Jerusalem, Israel).
J. Appl. Phys. (USA), vol.54, no.9, p.4947-50 (Sept. 1983).
A one dimensional model of electron multiplication in a gas in strong electric fields is considered by using the Laplace transform technique. An approximate expression for the first Townsend ionization coefficient is derived and found to be in a good agreement with the experimental data for a variety of atomic and molecular gases. (19 refs.)

118788 Ionization mechanism in a nitrogen glow discharge. H.Brunet, P.Vincent, J.R.Serra (Labś. de Marcoussis, Compagnie Generale d'Electricite, Marcoussis, France).
J. Appl. Phys. (USA), vol.54, no.9, p.4951-7 (Sept. 1983).
The electron distribution function has been calculated in nitrogen taking into account collisions of electrons with vibrationally excited molecules. Transport coefficients, vibrational excitation rates, excitation rates for the lowest-lying electronic states, and direct ionization rates are presented as a function of E/N (electric field to gas density ratio) for different values of the vibrational temperature. At low E/N values, a very large increase of the direct ionization rate is observed due to the rise of the tail of the electron distribution in presence of large vibrational populations. Ionization processes occurring in the collision of metastable molecules have also been investigated. It is concluded that in most glow discharge, ionization occurs mainly from associative ionization produced by collision between two metastable molecules in the $a'\Sigma_u^-$ state. Ionization due to collisions of electrons with metastable molecules was found to be unimportant because of the low concentration of metastable molecules in glow discharges. (15 refs.)

118789 Monte-Carlo simulation of electron properties in RF parallel plate capacitively coupled discharges. M.J.Kushner (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).
J. Appl. Phys. (USA), vol.54, no.9, p.4958-65 (Sept. 1983).
Electron properties in a parallel plate capacitively coupled RF discharge are studied with results from a Monte-Carlo simulation. Time averaged, spatially dependent electron distributions are computed by integrating, in time, electron trajectories as a function of position while oscillating the applied electric field at RF frequencies. The DC component of the sheath potential is solved for in a self-consistent manner during the simulation. For conditions where the secondary emission coefficient for electrons from the electrodes is large, the electron distribution is spatially differentiated, being dominated by an *e*-beam component near the electrodes while being nearly in equilibrium with the applied electric field in the body of the plasma. The DC component of the sheath potential is found to be a function of the ratio λ/d, where λ is the electron mean free path and d is the electrode spacing. (25 refs.)

118790 Isotope separation in a low-pressure DC discharge. A.I.Karchevskii, E.P.Potanin.
Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.553 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1286-8 (Nov. 1982). [received: Sept. 1983]
Recent successful experiments on the separation of isotopic mixtures of inert gases have attracted interest to the separation properties of DC discharges. The authors examine an isotope-separation mechanism in the positive column of a DC discharge for the case of a relatively low pressure, at which the ion mean free path is much larger than the radius of the discharge tube and at which the particle collision rate in the volume is low in comparison with the rate at which the particles collide with the wall. In this case the difference between the degrees of ionization of the different isotopes is determined by the different rates at which heavy and light ions are lost from the discharge. The rate at which the light particles collide with the wall and thus the recombination rate of the light particles are higher than those of the heavy particles. To estimate the magnitude of the effect the authors work from the continuity equations for the ions of each species of a binary isotopic mixture, under the assumption that the radial electric field in the positive column has a negligible effect on the transverse ion drift and thus on the rate at which the ions collide with the wall. (5 refs.)

118791 Calculation of the electric arc characteristics in a cylindrical channel taking into account radiation based on the three-layer model. N.F.Aleshin, A.F.Bublievskii.
Vestsi Akad. Navuk BSSR Ser. Fiz. Energ. Navuk, no.3, p.68-72 (1983). In Russian.
The three-layer model disregarding the axial temperature gradient component is used to obtain analytical expressions for calculating electric arc characteristics with allowance for radiation in the volumetric approximation. The results obtained are compared with the numerical calculation and two-layer model. (5 refs.)

118792 Constrained density modifications by variational techniques. J.Navaza, E.E.Castellano, G.Tsoucaris (Lab. de Phys., Tour B, Centre Univ. Pharmaceutique, Chatenay Malabry, France).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.622-31 (1 Sept. 1983).
A general method for phase extension and refinement is described. It consists of minimizing a conveniently defined functional M by the steepest-descent or conjugate-gradient techniques. This functional consists of a term $R={}^1/_2\Sigma(|F|-|F^{\text{obs}}|)^2$ plus any given number of constraint equations selected according to the requirements of the particular problem considered. Several examples of the introduction of constraints are described in detail, both in direct and reciprocal space, and a few one-dimensional tests provide insight in the behavior of the different alternatives. Also, some general features that the calculated electron density function should fulfil, such as positivity and boundness, are directly introduced without the need of terms other than R in the functional M. The connection between this approach and the ones which use the principle of maximum entropy is discussed. A critical analysis shows that those methods are just different ways of minimizing R with the constraints of positivity. (18 refs.)

118793 From a partial to the complete crystal structure. C.Giacovazzo (Istituto di Mineralogia e Petrografia, Univ. di Bari, Bari, Italy).
Acta Crystallogr. Sect. A (Denmark), vol.A39, pt.5, p.685-92 (1 Sept. 1983).
The joint probability distribution method is applied in order to estimate phases when part of the crystal structure is correctly positioned. The mathematical approach is briefly described and the conclusive formulas are compared with those given by previous authors. (18 refs.)
